formed in Attica, for the use of rhapsodists. The style is that of the Ionian or Homeric epos; but there are also several traces of the Hesiodic or Boeotian school. The principal "hymns" are (1) to Apollo (generally treated as two or more hymns combined in one); (2) to Hermes; (3) to Aphrodite; and (4) to Demeter. The hymn to Apollo, quoted by Thucydides (iii. 104) as Homer's, is of peculiar interest on account of the lines describing the Ionian festival at Delos. Two celebrated pieces of a sportive kind passed under the name of "Hymns to the Lares." Thucydides (in one who knew many things but knew them all badly"—is regarded by Aristotle as the earliest germ of comedy, and was possibly as old as 700 B.C. Only a few lines remain. The Batracho(myo)machia, or Battle of the Frogs and Mice probably belongs to the decline of Greek literature, perhaps to the 2nd century B.C. About 300 verses of it are extant. In the Iliad and the Odyssey the personal opinions or sympathies of the poet may sometimes be conjectured, but they are not declared or even hinted. Hesiod, indeed, sometimes gives us a glimpse of his own mind. Yet Hesiod is, on the whole, essentially a prophet. The message which he delivers is not from himself; the truths which he imparts have not been discovered by his own search. He is the mouthpiece of the Delphian Apollo. Personal opinion and feeling may tinge his utterance, but they do not determine its general complexion. The egotism is a single thread; it is not the basis of the texture. Epic poetry was in Greece the foundation of all other poetry; for many centuries no other kind was generally cultivated, no other could speak to the whole people. Politically, the age was monarchical or aristocratic; intellectually, too, the age was too simple for the analysis of thought or emotion. Kings and princes loved to hear of the great deeds of their ancestors; common men loved to hear of them too, for they had no other interest. The mind of Greece found no subject of contemplation so attractive as the warlike past of the race, or so useful as that lore which experience and tradition had bequeathed. But in the course of the 8th century B.C. the rule of hereditary princes began to disappear. Monarchy gave place to oligarchy, and this—often after the intermediate phase of a tyrannus—to democracy. Such a change was necessarily favourable to the growth of reflection. The private citizen is no longer a mere ciphers, the Homeric τίς, a unit in the dim multitude of the king-ruled folk; he gains more power of independent action, his mental horizon is widened, his life becomes fuller and more interesting. He begins to feel the need of expressing the thoughts and feelings that are stirred in him. But as yet a prose literature does not exist; the new thoughts, like the old heroic stories, must still be told in verse. The forms of verse created by this need were the Elegiac and the Iambic. The elegiac metre is, in form, a simple variation on the epic metre, obtained by docking the second of two hexameters so as to make it a verse of five feet or measures. But the poetic capabilities of the elegiac couplet are of a wholly different kind from those of heroic verse. Ἐλεγχός seems to be the Greek form of a name given by the Carians and Lydians to a lament for the dead. This was accompanied by the soft music of the Lydian flute, which continued to be associated with Greek elegy. The non-Hellenic origin of elegy is indicated by this very fact. The flute was to the Greeks an Asiatic instrument—string instruments were those which they made their own—and it would hardly have been wedded by them to a species of poetry which had arisen among themselves. The early elegiac poetry of Greece was by no means confined to mourning for the dead. War, love, politics, proverbial philosophy, were in turn its themes; it dealt, in fact, with the chief interest of the poet and his friends, whatever that might be at the time. It is the direct expression of the poet's own thoughts, addressed to a sympathizing society. This is its first characteristic. The second is that, even when most pathetic or most spirited, it still preserves, on the whole, the tone of conversation or of narrative. Greek elegy stops short of lyric passion. English elegy, whether funeral as in Dryden and Pope, or reflective as in Gray, is usually true to the same normal type. Roman elegy is not equally true to it, but sometimes tends to trench on the lyric province. For Roman elegy is mainly amatory or sentimental; and its masters imitated, as a rule, not the early Greek elegists, not Tyrtaeus or Theognis, but the later Alexandrian elegists, such as Callimachus or Philhæus. Catullus introduced into Latin elegiac poetry a style which women, children, and other readers as well as the poet himself could understand, and use it with more facility than his followers to its genuine Greek inspiration.

Elegy, as we have seen, was the first slight deviation from epos. But almost at the same time another species arose which had nothing in common with epos, either in form or spirit. This was the iambic. The word ἔαυβος, ἔαμβος (λαξευς, to dart or shoot) was used in reference to the licensed raffery at the festivals of Demeter; it was the maiden iambic, the myth said, who drew the first smile from the mourning goddess. The iambic metre was at first used for the expression of that deeper thought, that more inward self-communing, for which the elegiac form would have been inappropriate.

But these two forms of poetry, both Ionian, the elegiac and the iambic, belong essentially to the same stage of the literature. They stand between the Ionian epos and the lyric poetry of the Aeolians and Dorians. The earliest of the Greek elegists, Callinus and Tyrtaeus, use elegy to rouse a warlike spirit in singing hearts. Archilochus too wrote warlike elegy, but used it also in other strains, as in lament for the dead. The elegy of Minnæus of Smyrna or Colophon is the plaintive farewell of an ease-loving Ionian to the days of Ionian freedom. In Solon elegy takes a higher range; it becomes political and ethical. Archilochus represents the maturer union of politics with a proverbial philosophy. Another gnostic poet was Phocylides of Miletus; an admonitory poem extant under his name is probably the work of an Alexandrine Jewish Christian. Xenophanes gives a philosophic strain to elegy. With Simonides of Ceos it reverts, in an exquisite form, to its earliest destination, and becomes the vehicle of epitaph on those who fell in the Persian Wars. Iambic verse was used by Simonides (or Semonides) of Amorgus, and the chorus in his lyric were directed against classes rather than persons. Solon's iambics so far preserve the old associations of the metre that they represent the polemical or controversial side of his political poetry. Hipponax of Ephesus was another iambic satirist—using the σκακιον ("limping") or choliamic verse, produced by substituting a spondee for an iambus in the last place. But it was not until the rise of the Attic drama that the full capabilities of iambic verse were seen.

The lyric poetry of early Greece may be regarded as the final form of that effort at self-expression which in the elegiac and iambic is still incomplete. The lyric expression is deeper and more impassioned. Its intimate union with music and with the rhythmical movement of the dance gives to it more of an ideal character. At the same time the continuity of the music permits pause to the voice—pauses necessary as relics after a climax. Before lyric poetry could be effective, it was necessary that some progress should have been made in the art of music. The instrument used by the Greeks to accompany the voice was the four-stringed lyre, and the first great epoch in Greek music was when Terpander of Lesbos (660 B.C.), by adding three strings, gave the lyre the

1 Others attribute it, as well as the Margites, to Figures of Halicarnassus, the supposed brother of the Carian queen Artemisia, who fought on the side of Xerxes at the battle of Salamis.
lyric whose significance is not merely Aeolian or Dorian but Panhellenic. The same character belongs even more completely to his younger contemporary. Pindar (c. 518–c. 443) was born in Boeotia of a Dorian stock; thus, as Ionian and Dorian elements meet in Simonides, so Dorian and Aeolian elements meet in Pindar. Simonides was perhaps the most tender and most exquisite of the lyric poets. Pindar was the boldest, the most fervid and the most sublime. His extant fragments represent almost every branch of the lyric art. But he is known to us mainly by forty-four *Epinicia* or odes of victory, for the Olympian, Pythian, Nemean and Isthmian festivals. The general characteristic of the treatise is that a particular victory is made the occasion of introducing heroes' legends connected with the family or city of the victor, and of inculcating the moral lessons which they teach. No Greek lyric poetry can be completely appreciated apart from the music, now lost, to which it was set. Pindar's odes were, further, essentially occasional poems; they abound in allusions of which the effect is partly or wholly lost on us; and the glories which they celebrate belong to a life which we can but imperfectly realize.

Of all the great Greek poets, Pindar is perhaps the one to whom it is hardest for us to do justice; yet we can at least recognize his splendid gift of imagination, his strong rapidity and his soaring flight.

Bacchylides of Ceos (c. 504–430), the youngest of the three great lyric poets and nephew of Simonides, was known only by scanty fragments until the discovery of nineteen poems on an Egyptian papyrus in 1856. They consist of thirteen (or fourteen) *epinicia*, two of which celebrate the same victories as two odes of Pindar. The papyrus also contains six odes for the festivals of gods or heroes. The poems contain valuable information on the court life of the time and legendary history. Bacchylides, the little "Cean nightingale," is inferior to his great rival Pindar, "the Swan of Dirce," in originality and splendour of language, but he writes simply and elegantly, while his excellent γνωμα attracted readers of a philosophical turn of mind, amongst them the emperor Julian.

Similarly, the scanty fragments of Timotheus of Miletus (d. 357), musical composer and poet, and inventor of the eleven-stringed lyre, were increased by the discovery in 1902 of some 250 lines of his "nome" the *Perse", written after the manner of Homeric epic. The remaining 150 lines of "The beginning of Salamis; the end of Pindar's odes of victory, the battle of Salamis; the end is of a personal nature. The papyrus is the oldest Greek MS. and belongs to the age of Alexander the Great. The language is frequently very obscure, and the whole is a specimen of lyric poetry in its decline.

(B) The Attic Literature.—The Ionians of Asia Minor, the Aeolians and the Dorians had now performed their special parts in the development of Greek literature. Epic poetry had interpreted the heroic legends of warlike deeds done by Zeus-nourished kings and chiefs. Then, as the individual life became more and more elegant and iambic poetry had become the social expression of that life in all its varied interests and feelings. Lastly, lyric poetry had arisen to satisfy a twofold need—to be the more intense utterance of personal emotion, or to give choral voice, at stirring moments, to the faith or fame, the triumph or the sorrow, of a city or a race. A new form of poetry was now to be created, with elements borrowed from all the rest. And this was to be achieved by the people of Attica, in whose character and language the distinctive traits of an Ionian descent were tempered with some of the best qualities of the Dorian stock.

The drama (q.v.) arose from the festivals of Dionysus, the god of wine, which were held at intervals from the beginning of winter to the beginning of spring. A troop of rustic worshippers would gather around the altar of the god, and sing a hymn in his honour, telling of his victories or sufferings in his progress over the earth. "Tragedy" meant "the goat-song," a goat (ράδευς) being sacrificed to Dionysus before the hymn was sung. "Comedy," "the village-song," is the same hymn regarded as an occasion for...
Sophocles, the also "a comedy which detail his sphere. or of power; was tragic third nature. He marks place improvements which have which performed from Phrynichus, the chorale himself, part satyrs," Aeschylus of Athens and Pratinas of Phlius, who belonged to the same period, developed the satyr play; Pratinas also wrote tragedies, dithyrambs, and kyphorechmata (lively chorale odes chiefly in honour of Apollo).

Aeschylus (born 525 B.C.) became the real founder of tragedy by introducing a second actor, and thus rendering the dialogue independent of the chorus. At the same time the choral song—hitherto the principal part of the performance—became subordinate to the dialogue; and drama was mature. Aeschylus is also said to have made various improvements of detail in costume and the like; and it was early in his career that the theatre of Dionysus under the acropolis was commenced—the first permanent home of Greek drama, in place of the temporary stands to which Aeschylus seems to have been used. The system of the "trilogy" and the "tetralogy" is further ascribed to Aeschylus,—the "trilogy" being properly a series of three tragedies connected in subject, such as the Agamemnon, Choephoroi, Eumenides, which together form the Orestes, or Story of Orastes. The "tetralogy" is such a triad with a "satyr play" added—that is, a drama in which "satyrs," the grotesque woodland beings who attended on Dionysus, formed the chorus, as in the earlier dithyramb from which drama sprang. The Cyclopes of Euripides is the only extant specimen of a satyr play. In the seven tragedies which alone remain of the seventy which Aeschylus is said to have composed, the forms of kings and heroes have a grandeur which is truly Homeric; there is a spirit of Panhellenic patriotism such as the Persian Wars in which he fought might well quicken in a soldier-poet; and, pervading all, there is a strain of speculative thought which seeks to reconcile the apparent conflicts between the gods of heaven and of the underworld by the doctrine that both alike, constrained by necessity, are working out the law of righteousness. Sophocles, who was born thirty years after Aeschylus (405 B.C.), is the most perfect artist of the ancient drama. No other dramatist had thus far given him to Greece so high a degree of ideal beauty, or appreciated so finely the possibilities and the limitations of his sphere. He excels especially in drawing character; his Antigone, his Ajax, his Oedipus—indeed, all the chief persons of his dramas—are typical studies in the great primary emotions of human nature. He gave a freer scope to tragic dialogue by adding a third actor; and in one of his later plays, the Oedipus at Colonus, a fourth actor is required. From the time when he won the tragic prize from Aeschylus at Delphi in 405 B.C. he was the favourite dramatist of Athens; and for more than a century he was not only a great dramatist, but also the most spiritual representative of the age of Pericles. The distinctive interest of Euripides is of another kind. He was only fifteen years younger than Sophocles; but when he entered on his poetical career, the old inspirations of tragedy were already failing. Euripides marks a period of transition in the tragic art, and is, in fact, the mediator between the classical and the romantic drama. The myths and traditions with which the elder dramatists had dealt no longer commanded an unquestioning faith. Euripides himself was imbued with the new intellectual scepticism of his day; and the speculative views which were conflicting in his own mind are reflected in his plays. He had much picturesque and pathetic power; he was a master of expression; and he shows ingenuity in devising fresh resources for tragedy—especially in his management of the choral songs. Aeschylus is Panhellenic, Sophocles is Athenian, Euripides is cosmopolitan. He stands nearer to the modern world than either of his predecessors; and though with him Attic tragedy loses its highest beauty, it acquires new elements of familiar human interest.

In Attica, as in England, poetry of rather less than fifty years sufficed for a complete development of the tragic art. The two distinctive characteristics of Athenian drama are its originality and its abundance. The Greeks of Attica were not the only inventors of drama, but they were the first people who made drama a complete work of art. And the great tragic poets of Attica were remarkably prolific. Aeschylus was the reputed author of 70 tragedies, Sophocles of 113, Euripides of 92; and there were others whose productiveness was equally great.

Comedy represented the lighter side, as tragedy the graver side, of the Dionysiac worship; it was the joy of spring following the gloom of winter. The process of growth was nearly the same as in tragedy; but the Dionysians, not the Ionians of Attica, were the first who added dialogue to the comic chorus. Susarion, a Dorian of Megara, exhibited, about 580 B.C., pieces of the kind known as "Megarian farces." Epicharmus of Cos (who settled at Syracuse) gave literary form to the Doric farce, and treated in burlesque style the stories of gods and heroes, and subjects taken from everyday life. His Syracusan contemporary Sophron (c. 450) was a famous writer of mimes, chiefly scenes from middle-class life. The most artistic form of comedy seemed, however, to have developed in Attica. The greatest names before Aristophanes are those of Cratinus and Eupolis; but from about 470 B.C. there seems to have been a continuous succession of comic dramatists, amongst them Plato Comicus, the author of 28 comedies, political satires and parodies after the style of the Middle Comedy. Aristophanes came forward as a comic poet in 427 B.C., and retained his popularity for about forty years. He presents a perhaps unique union of bold fancy, exquisite humour, critical acumen and lyrical power. His eleven extant comedies may be divided into three groups, according as the licence of political satire becomes more and more restricted. In the Acknowledgments, Knights, Clouds, Wasps and Peace (425-421) the poet uses unrestrained freedom. In the Birds, Lysistrata, Thesmophoriazusae and Frogs (414-405) a greater reserve may be perceived. Lastly, in the Ecclesiazusae and the Plutus (392-388) personal satire is almost wholly avoided. The same general tendency continued. The so-called "Middle Comedy" (390-330) represents the transition from the Old Comedy, or political satire, to satire of a literary or social nature; its chief writers were Anti- phon of Athens and Alexis of Thessali. The "New Comedy" (330-280) seems to have been wholly of this latter order of thought.

Its chief representative was Menander (342-291), the author of 105 comedies. Fragments have been discovered of seven of these, of sufficient length to give an idea of their dramatic action. His plays were produced on the stage as late as the time of Plutarch, and his ρηώμα, distinguished by worldly wisdom, were issued in the form of anthologies, which enjoyed great popularity. Other prominent writers of this class were Diphilus, Philemon, Posidippus and Apollodorus of Corcyra. About 350 B.C. Rhinthon of Tarentum revived the old Doric farce in a new form known as the "Hilarotragoediae." These successive periods cannot be sharply or precisely marked off. The change which gradually passed over the comic drama was simply the reflection of the change which passed over the political and social life of Athens. The Old Comedy, as we see it in the earlier plays of Aristophanes, was probably the most powerful engine of public criticism that has ever existed in any community. Unsparking personality was its essence. The comic poet used this recognized right on an occasion at once festive and sacred, in a society where every man of any note was known by name and sight to the rest. The same thousands who heard a policy or a character denounced or lauded in the theatre might be required to pass sentence on it in the popular assembly or in the courts of law.
The development of Greek poetry had been completed before a prose literature had begun to exist. The earliest name in extant Greek prose literature is that of Herodotus; and, when he wrote, the Attic drama had already passed its prime. There had been, indeed, writers of verse before Herodotus; but they had not been, in the proper sense of the term, literary writers. The causes of this comparatively late origin of Greek literary prose are independent of the question as to the time at which the art of writing began to be generally used for literary purposes. Epic poetry exercised for a very long period a sovereign spell over the Greek mind. In it was deposited all that the race possessed of history, theology, philosophy, oratory. Even after an age of reflection had begun, elegiac poetry, the first offspring of epic, was, with iambic verse, the vehicle of much which among other races would have been committed to prose. The basis of Greek culture was essentially poetical. A political cause worked in the same direction. In the Eastern monarchies the king was the centre of all, and the royal records afforded the elements of history from a remote date. The Greek nation was broken up into small states, each busied with its own affairs and its own men. It was the collision between the Greek and the barbarian world which first provided a national subject for a Greek historian. The work of Herodotus, in its relation to Greek prose, is so far analogous to the Iliad in its relation to Greek poetry, that it is the earliest work of art, and that it bears a Panhellenic stamp. The sense and the degree in which Herodotus was original may be inferred from what is known of earlier prose-writers.

For about a century before Herodotus there had been a series of writers in philosophy, mythology, geography and history. The earliest, or among the earliest, of the philosophical writers were Pherecydes of Syros (550 B.C.) and the Ionian Anaximenes and Anaximander. It is doubtful whether Cadmus of Miletus, supposed to have been the first prose writer, was an historical personage. The Ionian writers, especially Anaximander and Pherecydes, were called "narrators" (as distinguished from ἰστοροι, makers of verse), were those who compiled the myths, especially in genealogies, or who described foreign countries, their physical features, usages and traditions. Hecataeus of Miletus (500 B.C.) is the best-known representative of the logographi in both these branches. Helenianus of Mytilene (450 B.C.), among whose works was a history of Attica, appears to have made a nearer approach to the character of a systematic historian. Other logographi were Charon of Lampasacus; Pherecydes of Leros, who wrote on the myths of early Attica; Hippys of Rhegium, the oldest writer on Italy and Sicily; and Acusilas of Argos in Boeotia, author of genealogies (see LOGOGRAPHI, and GREECE: ANCIENT HISTORY, "Authorities").

Herodotus was born in 484 B.C.; and his history was probably not completed before the beginning of the Peloponnesian War (431 B.C.). His subject is the struggle between Greece and Asia, which he deduces from the legendary rape of the Argive Io by Phoenicians, and traces down to the final victory of the Greeks over the invading host of Xerxes. His literary kinship with the historical or geographical writers who had preceded him is seen mainly in two things. First, though he draws a line between the mythical and the historical age, he still holds that myths, as such, are worthy to be reported, and that in certain cases it is part of his duty to report them. Secondly, he follows the example of such writers as Hecataeus in describing the natural and social features of countries. He seeks to combine the part of the geographer or intelligent traveller with his proper part as historian. But when we pass to those minor traits to the larger aspects of his work, Herodotus stands forth as an artist whose conception and whose method were his own. His history has an epic unity. Various as are the subordinate parts, the action narrated is one, great and complete; and the unity is due to this, that Herodotus refers all events of human history to the principle of divine Nemesis. If Sophocles had told the story of Oedipus in the Oedipus Tyrannus alone, and had not added to it the Oedipus at Colonus, it would have been comparable to the story of Xerxes as told by Herodotus. Great as an artist, great too in the largeness of his historical conception, Herodotus fails chiefly by lack of insight into political cause and effect, and by a general silence in regard to the history of political institutions. Both his strength and his weakness consist in the political point of view. This is contrasted with that other historian who was strictly his contemporary and who yet seems divided from him by centuries.

Thucydides was only thirteen years younger than Herodotus; but the intellectual space between the men is so great that they seem to belong to different ages. Herodotus is the first artist in historical writing; Thucydides is the first thinker. Herodotus interweaves two threads of causation—human agency, represented by the good or bad qualities of men, and divine agency, represented by the vigilance of the gods on behalf of justice. Thucydides concentrates his attention on the human agency (without, however, denying the other), and strives to trace its exact course. The subject of Thucydides is the Peloponnesian War. In resolving to write its history, he was moved, he says, by these considerations. It was probably the greatest movement which had ever affected Hellas collectively. It was possible for him as a contemporary to record it with approximated accuracy. And this record was likely to have a general value, over and above its particular interest as a record, seeing that the political future was likely to resemble the political past. This is what Thucydides means when he calls his work "a possession for ever." The speeches which he ascribes to the persons of the history are, as regards form, his own essays in rhetoric of the school to which Antiphon belongs. As regards matter, they are always so far dramatic that the thoughts and sentiments are such as he conceived possible for the supposed speaker. Thucydides abandons, as a rule, from moral comment; but he tells his story as no one could have told it who did not profoundly feel its tragic force; and his general claim to the merit of impartiality is not invalidated by his partiality—difficult to estimate—in the cases of Cleon and Hyperbolus.

Strong as is the contrast between Herodotus and Thucydides, their works have yet a character which distinguishes both alike from the historical work of Xenophon in the Anabasis and the Hellenica. Herodotus gives us a vivid drama with the unity of an epic. Thucydides takes a great chapter of contemporary history and traces the causes which are at work throughout it, so as to give the whole a scientific unity. Xenophon has not the grasp either of the dramatic or of the philosophical unity. His work does not possess the higher unity either of art or of science. The true distinction of Xenophon consists in his thorough combination of the practical with the literary character. He was an accomplished soldier, who had done and seen much. He was also a good writer, who could make a story both clear and lively. But the several parts of the story are not grouped around any central idea, such as a divine Nemesis is for Herodotus, or such as Thucydides finds in the nature of political man. The seven books of the Hellenica form a supplement to the history of Thucydides, beginning in 411 and going down to 362 B.C. The chief blot on the Hellenica is the author's partiality to Sparta, and in particular to Agesilaus. Some of the greatest achievements of Epaminondas and Pelopidas are passed over in silence. On the whole, Xenophon is perhaps seen at his best in his narrative of the Retreat of the Ten Thousand—a subject which exactly suits him. The Cyropaedia is a romance of little historical worth, but with many good passages. The Recollections of Socrates, on the other hand, derive their principal value from being uniformly matter-of-fact. In his minor pieces on various subjects Xenophon appears as the earliest essayist. It may be noted that one of the essays especially ascribed to him—that On the Athenian Polity—is probably the oldest specimen in existence of literary Attic prose.

His contemporaries Ctesias of Cnidus and Phyllistus of Syracuse wrote histories of Persia and Sicily. In the second half of the 4th century a number of histories were compiled by literary men of little practical knowledge, who had been trained in the
rhetorical schools. Such were Euphorus of Cyme and Theopompus of Chios, both pupils of Isocrates; and the writers of "Athides" (chronicles of Attic history), the chief of whom were Androtion and Philochorus. Timaeus of Tauromenium was the author of a great work on Sicily, and introduced the system of reckoning by Olympiads.

The steps by which an Attic prose style was developed, and the principal forms which it assumed, can be traced most clearly in the Attic orators. Every Athenian citizen who aspired to take part in the affairs of the city, or even to be qualified for self-defence before a law-court, required to have some degree of skill in public speaking; and an Athenian audience looked upon public debate, whether political or forensic, as a competitive trial of proficiency in a fine art. Hence the speaker, no less than the writer, was necessarily a student of finished expression; and oratory had a more direct influence on the general structure of literary prose than has ever perhaps been the case elsewhere. A systematic rhetoric took its rise in Sicily, where Corax of Syracuse (466 B.C.) devised his "Art of Words" to assist those who were pleading before the law-courts; and it was brought to Athens by his disciple Tisias. The teaching of the Sophists, again, directed attention, though in a superficial and imperfect way, to the elements of grammar and logic; and Gorgias of Leontini—whose declamation, however turgid, must have been striking—gave an impulse at Athens to the study of rhetoric. The teaching of Isocrates in well-known and interesting cases is a grave, dignified movement, a frequent emphasis on verbal contrasts, and a certain austere elevation.

The interest of Andocides is mainly historical; but he has graphic power. Lysias, the representative of the "plain style," breaks through the rigid mannerness of the elder school, and uses the language of daily life with an ease and grace which, though the result of study, do not betray their art. He is, in his own way, one of the greatest stylists in all literature, and his pupils and imitators, who, for others, exhibit also a high degree of the artistic skill. Lysias, whose manner may be regarded as intermediate between that of Antiphanes and that of Lysias, wrote for readers rather than for hearers. The type of literary prose which he founded is distinguished by ample periods, by studied smoothness and by the temperate use of rhetorical ornament. From the middle of the 4th century B.C. the Isocratean style of prose became general in Greek literature. From the school of Rhodes, in which it became more florid, it passed to Cicero, and through him it has helped to shape the literary prose of the modern world. The speeches of Isocrates are indeed interesting, and in some of them exhibit also a high degree of the artistic skill. Lysias, whose manner may be regarded as intermediate between that of Antiphanes and that of Lysias, wrote for readers rather than for hearers.

red and vivid, perceptions which had been quickened in them by a living communion with the Athenian spirit, by a daily contemplation of Athenian greatness, in the theatre where tragic poets idealized the legends of the past, in the ecclesia where every citizen had his vote on the policy of the state, or in that free and gracious society, full of beauty, yet exempt from vexatious constraint, which belonged to the age of Pericles. The tribunal which judged these works of literature or art was such as was best fitted to preserve the favourable conditions under which they arose. Criticism was not in the hands of a literary clique, or of a social caste, insulated by indolence, or infected with malevolence, and the more fatal influence of affectation, had little power to affect the verdict. The verdict was pronounced by the whole body of the citizens. The success or failure of a tragedy was decided, not by the minor circumstance that it gained the first or second prize, but by the collective opinion of the citizens assembled in the theatre of Dionysus. A work of architecture or sculpture was approved or condemned, not by the sentence of a few whom the multitude blindly followed, but by the general judgment of some twenty thousand persons, each of whom was in some way qualified by education or occupation to form an independent estimate. The artist worked for all his fellow-citizens, and knew that he would be judged by all. The soul of his work was the fresh and living inspiration of nature; it was the ennobled expression of his own life; and the public opinion before which it came was free, intelligent and sincere.

Philip of Macedon did not take away the municipal independence of the Greek cities, but he dealt a death-blow to the old political life. The Athenian poet, historian, artist might still do good work, but he could never again have that which used to be the very mainspring of all such activity—the daily experience and consciousness of participation in the affairs of an independent state. He could no longer breathe the invigorating air of constitutional freedom, or of the social intercourse to which that freedom lent dignity as well as grace. Then came Alexander's conquests; Greek civilization was diffused over Asia and the East by means of Greek colonies in which Asiatic and Greek elements were mingled. The life of such settlements, under the monarchies into which Alexander's empire broke up, could not be animated by the spirit of the Greek commonwealths in the old days of political freedom. But the externals of Greek life were there—the temples, the statues, the theatres, the porticos. Ceremonies and festivals were conducted in the Greek manner. In private life Greek usages prevailed. Greek was the language most used; Greek books were in demand. The mixture of races would always in some measure distinguish even the outward life of such a community from that of a pure Greek state; and the facility with which Greek civilization was adopted would vary in different places. Syria, for example, was rapidly and completely Hellenized. Judaea resisted the process to the last. In Egypt a Greek aristocracy of office, birth and intellect existed side by side with a distinct native life. But, viewed in its broadest aspect, this new civilization may be called Hellenism. Hellenism (q.v.) means the adoption of Hellenic ways; and it is properly applied to a civilization, generally Hellenic in external things, pervading people not necessarily or exclusively Hellenic by race. What the Hellenic literature was to Hellas, that the Hellenistic literature was to Hellenism. The literature of Hellenism has the Hellenic form without the Hellenic soul. The literature of Hellas was creative; the literature of Hellenism is derivative.

Alexandria was the centre of Greek intellectual activity from Alexander to Augustus. Its "Museum," or college, and its library, both founded by the first Ptolemy (Soter), gave it such attractions for learned men as no other city could rival. The labours of research or arrangement are those which characterize the Alexandrian period. Even in its poetry spontaneous motive was replaced by erudite skill, as in the hymns, epigrams and elegies of Callimachus, in the enigmatic verses of Lyceophon, in the highly finished epic of Apollonius Rhodius, and in the versified lore, astronomical or medical, of Aratus and Nicander. The mimes of Herodas (or Herondas) of Cos (c. 200 b.c.), written in the Ionic dialect and choliambic verse, represent scenes from everyday life. The papyrus (published in 1891) contains seven complete poems and fragments of an eighth. They are remarkably witty and full of shrewd observations, but at times coarse. The pastoral poetry of the age—Dorian by origin—was the most pleasing; for this, if it is to please at all, must have its spring in the contemplation of nature. Theocritus is not exempt from the artificialism of the Hellenizing literature; but his true sense of natural beauty entitles him to a place in the line of the Greek poets. Bion of Ionia and the elegies of Syracusian also charm by the music and often by the pathos of their bucolic verse. Excavations on the site of the temple of Asclepius at Epidaurus have brought to light two hexameter poems and a paean (in Ionie metre) on Apollo and Asclepius by a local poet named Isyllus, who flourished about 280. Tragedy was represented by the poets known as the Alexandrian Pleiad. But it is not for its poetry of any kind that this period of Greek literature is memorable. Its true work was in erudition and science. Aristarchus (356 B.C.), the greatest in a long line of Alexandrian critics, to the example of Eratosthenes, and was combined with history by Manetho in his chronicles of Egypt, and by Berossus in his chronicles of Chaldaea. Euclid was at Alexandria in the reign of Ptolemy Soter. Herophilus and Erasistratus were distinguished physicians and anatomists, and the authors of several medical works. The general results of the Alexandrian period might perhaps be stated thus. Alexandria produced a few eminent men of science, some learned poets (in a few cases, of great literary merit) and many able scholars. The preservation of the best Greek literature was due chiefly to the unremitting care of the Alexandrian critics, whose appreciation of its value compensated for the decay of the old Greek perceptions in literature and art, and who did their utmost to hand it down in a form as free as possible from the errors of copyists. On the whole, the patronage of letters by the Ptolemies had probably as large a measure of success as was possible under the existing conditions; and it was afforded at a time when there was special danger that a true literary tradition might die out of the world.

The Graeco-Roman period in the literature of Hellenism may be dated from the Roman subjugation of Greece. "Greece made a captive of the Hellenic conqueror," but it did not follow from this intellectual conquest that Athens became once more the intellectual centre of the world. Under the empire, indeed, the university of Athens long enjoyed a pre-eminent reputation. But Rome gradually became the point to which the greatest workers in every kind were drawn. Greek literature had already made a home there before the close of the 2nd century B.C. Sulla brought a Greek library from Athens to Rome. Such men as Cicero and Atticus were indefatigable collectors and readers of Greek books. The power of speaking and writing the Greek language became an indispensable accomplishment for highly educated Romans. The library planned by Julius Caesar and founded by Augustus had two principal departments, one for Latin, the other for Greek works. Tiberius, Vespasian, Domitian and Trajan contributed to enlarge the collection. Rome became more and more the rival of Alexandria, not only as possessing great libraries, but also as a seat of learning at which Greek men of letters found appreciation and encouragement. Greek poetry, especially in its higher forms, rhetoric and literary criticism, history and philosophy, were all cultivated by Greek writers at Rome.
The first part of the Graeco-Roman period may be defined as extending from 146 B.C. to the close of the Roman Republic. At its commencement stands the name of one who had more real affinity than any of his contemporaries with the great writers of old Athens, and who, at the same time, saw most clearly how the empire of the world was passing to Rome. Thesubject of Polybius (c. 205–120) was the history of Roman conquest from 264 to 146 B.C. His style, plain and straightforward, is free from the florid rhetoric of the time. But the distinction of Polybius is that he is the last Greek writer who in some measure retains the spirit of the old citizen-life. He chose his subject, not because it gave scope to learning or literary skill, but with a motive akin to that which prompted the history of Thucydides—namely, because, as a Greek citizen, he felt intensely the political importance of those wars which had given Rome the mastery of the world.

The chief historical work which the following century produced—the Universal History of Diodoros Siculus (l.c. 50 B.C.)—resembled that of Polybius in recognizing Rome as the political centre of the earth, as the point on which all earlier series of events converged. In all else Diodoros represents the new age in which the Greek historian had no longer to produce knowledge. At his birth-encement stands the name of one who, perhaps, more than any other, swelled the ranks of the professional traveller, a soldier or a statesman, but only the diligence, and usually the dulness, of a laborious compiler.

The Greek literature of the Roman empire, from Augustus to Justinian, was enormously prolific. The area over which the Greek language was diffused—either as a medium of intercourse or as an established branch of the higher education—was co-extensive with the empire itself. An immense store of materials had now been accumulated, on which critics, commentators, compilers, imitators, were employed with incessant industry. In very many of its forms, the work of composition or adaptation had been reduced to a mechanical knack. If there is any one characteristic which broadly distinguishes the Greek literature of these five centuries, it is the absence of originality either in form or in matter. Lucian is, in his way, a rare exception; and his great popularity—he is the only Greek writer of this period, except Plutarch, who has been widely popular—illuminates the flatness of the arid level above which he stands out. The sustained abundance of literary production under the empire was partly due to the fact that there was no open political career. Never, probably, was literature so important as a resource for educated men; and the habit of reciting before friendly or obsequious audiences swelled the number of writers whose taste had been cultivated to a point just short of perceiving that they ought not to write.

In the manifold prose work of this period, four principal departments may be distinguished. (1) History, with Biography, and Geography. History is represented by Dionysius of Halicarnassus—also memorable for his criticism on the orators and his effort to revive a true standard of Attic prose—by Cassius Dio, Josephus, Arrian, Appian, Herodian, Eusebius and Zosimus. In biography, the foremost names are Plutarch, Diogenes Laërtius and Philostratus; in geography, Hipparchus of Nicaea, Strabo, Ptolemy and Pausanias. (2) Erudition and Science. The learned labours of the Alexandrian schools were continued in all their various fields. Under this head may be mentioned such works as the lexicons of Julius Pollux, Harpocration and Hesychius, Herpaëtius's treatise on metre, and Herodian's system of accentuation; the commentaries of Galen on Plato and on Hippocrates; the learned miscellanies of Athenaeus, Aelian and Stobaeus; and the Stratagems of Polyaeus. (3) Rhetoric and Belles-Lettres. The most popular writers on the theory of rhetoric were Hermogoras, Hermogenes, Aphthonius and Cassius Longinus—the last the reputed author of the essay On Sublimity. Among the most renowned teachers of rhetoric—now distinctly called "Sophists," or rhetoricians—were Dio Chrysostom, Aelius Aristides,Themistius, Himerius, Libanius and Heroes Atticus. Akin to the rhetorical exercises were various forms of ornamental or imaginative prose—dialogues, letters, essays or novels. Lucian, in his dialogues, exhibits more of the classical style and of the classical spirit than any writer of the later age; he has also a remarkable affinity with the tone of modern satire, as in Swift or Voltaire. His Attic prose, though necessarily artificial, was at least the best that had been written for four centuries. The emperor Julian was the author both of orations and of satirical pieces. The chief of the Greek novelists (the forerunner of whom was Aristides of Milesius, c. 100 B.C., in his Milestian Tales) are Xenophon of Ephesus and Longus, representing a purely Greek type of novel; and the Christian novelists of the 4th century, such as Alciphron—representing a school influenced by Oriental fiction. There were also many Christian romances in Greek, usually of a religious tendency. Alciphron's fictitious Letters—founded largely on the New Comedy of Athens—represent some kind of industry which produced the letters of Phalaris, Aristaenetus and similar collections. (4) Philosophy is represented chiefly by Epictetus and Marcus Aurelius, in both of whom the Stoic element is the prevailing one; by the Neo-platonists, such as Plotinus, Porphyry, Iamblichus; and by Priscian, who taught that eclectical school which arose at Athens in the 5th century A.D.

The Greek poetry of this period presents no work of high merit. Babrius versified the Aesopic Fables; Oppian (or two poets of this name) wrote didactic poems on fishing and hunting; Nonnus and Quintus Smyrnaeus made elaborate essays in epic verse; and the Orphic lore inspired some poems and hymns of a mystic character. The so-called Sibylline Oracles, in hexameter verse, range in date from about 170 B.C. to A.D. 700, and are partly the expression of the Jewish longing for the re-creation of the ancient, partly predictions of the triumph of Christianity. By far the most pleasing contributions to the literary world are such poems as have come to us from this age which are some of the short poems in the Greek Anthology, which includes some pieces as early as the beginning of the 5th century B.C. and some as late as the 6th century of the Christian era.

The 4th century may be said to mark the beginning of the last stage in the decay of literary Hellenism. From that point the decline was rapid and nearly continuous. The attitude of the church towards it was no longer that which had been held by Clement of Alexandria, or Justin Martyr or Origen. There was now a Christian Greek literature, and a Christian Greek eloquence of extraordinary power. The laity became more and more estranged from the Greek literature—however intrinsically pure and noble—of the pagan past. At the same time the Greek language—which had maintained its purity in Italian seats—was becoming corrupted in the new Greek Rome of the East. In A.D. 529 Justinian put forth an edict by which the schools of heathen philosophy were formally closed. The act had at least a symbolic meaning. It is necessary to guard against the supposition that such assumed landmarks in political or literary history always mark a definite transition from one order of things to another. It is practically convenient, or necessary, to use such landmarks.

BIBLIOGRAPHY.—The first attempt at a connected history of Greek literature was the monumental and still indispensable work of J. A. Fabricius (14 vols., 1765–1728; new ed. in 12 vols. by G. C. Harless, 1790–1800); this was followed by F. Schöll's Hist. der griech. rerum literarum (1833–1853). Both these works begin in the earliest times and go down to the latest period of the Byzantine empire. Of more modern and recent works the following may be named: Berchem's Geschichte der griechischen Literatur (1836–1845; 4th ed., 1876–1880; 5th ed. of vol. I., by W. Volkmann, 1892), chiefly confined to the poets; C. O. Müller, History of Greek Literature (unfinished), written for the London Society for the Diffusion of Useful Knowledge, and published in English in 1844 under the title of A History of the English Language; the translation being by G. Conwell Lewis and W. J. Donaldson (the latter completed the work to the end of the Byzantine period for the edi- tion of 1854–1855); G. Corin's Geschichte der griechischen Literatur (4th ed., 1876; 2nd ed., 1884), with a supplement by E. Heitz, 1885; W. Marcus, Critical History of the Language and Literature of Ancient Greece (1850–1857); T. Bergk, Griechische Literaturgeschichte (1872–1894).

II. Byzantine Literature

By "Byzantine literature" is generally meant the literature, written in Greek, of the so-called Byzantine period. There is no justification whatever for the inclusion of Latin works of the time of the Eastern Roman empire. The close of the Byzantine period is clearly marked by the year 1453, at which date, with the fall of the Eastern empire, the peculiar culture and literary life of the Byzantines came to an end. It is only as regards the beginning of the Byzantine period that any doubts exist. There are no sufficient grounds for dating it from Justinian, as was formerly often done. In surveying the whole development of the political, ecclesiastical and literary life and of the general culture of the Roman empire, and particularly of its eastern portion, we arrive, on the contrary, at the conclusion that the actual date of the beginning of this new era—i.e. the Christian-Byzantine, in contradistinction to the Pagan-Greek and Pagan-Roman—falls within the reign of Constantine the Great. By the foundation of the new capital city of Constantinople (which lay amid Greek surroundings) and by the establishment of the Christian faith as the state religion, Constantine finally broke with the literature and thought of the Roman tradition, and laid the foundation of the Christian-Byzantine period of development. Moreover, in the department of language, so closely allied with that of literature, the 4th century marks a new epoch. About this time occurred the final disappearance of a characteristic of the ancient Greek language, important alike in poetry and in rhythmical prose, the difference of "quantity." Its place was henceforth taken by the accent, which became a determining principle in poetry, as well as for the rhythmical conclusion of the prose sentence. Thus the transition from the old musical language to a modern conversational idiom was complete.

The reign of Constantine the Great undoubtedly marks the beginning of a new period in the most important spheres of national life, but it is equally certain that in most of them ancient tradition long continued to exercise an influence. Sudden breaches of continuity are less common in the general culture and literary life of the world than in its political or ecclesiastical development. This is true of the transition from pagan antiquity to the Christian middle ages. This was due to the final victory of the new religious ideas and the new spirit in public and private intellectual and moral life. The last noteworthy remnants of paganism disappeared as late as the 6th and 7th centuries. The last great educational establishment which rested upon pagan foundations—the university of Athens—was not abolished till A.D. 529. The Hellenizing of the seat of empire and of the state, which was essential to the independent development of Byzantine literature, proceeds yet more slowly. The first purely Greek emperor was Tiberius II. (578–582); but the complete Hellenizing of the character of the state had not been accomplished until the 7th century. We shall, therefore, regard the period from the 4th to the 7th century as that of the transition between ancient times and the middle ages. This period coincides with the rise of a new power in the world's history—Islam. But, though, in this transitional period, the old and the new elements are both to a large extent present and are often inextricably interwoven, yet it is certain that the new elements are, both as regards their essential force and their influence upon the succeeding period, of infinitely greater moment than the decrepit and mostly artificial survivals of the antique.

In order to estimate rightly the character of Byzantine literature and its distinctive peculiarities, in contradistinction to ancient Greek, it is imperative to examine the great difference between the civilizations that produced them. The Byzantine did not possess the homogeneous, organically constructed system of the ancient civilization, but was the outcome of an amalgamation of which Hellenism formed the basis. For, although the Latin character of the empire was at first completely retained, even after its final division in 395, yet the dominant position of Greek in the Eastern empire gradually led to the Hellenizing of the state. The last great act of the Latin tradition was the translation of the Latin Church fathers of the 4th century into Greek by Bursian's Jahresberich; and even then its influence remained considerable, as is shown by the "Novels of Justinian," whose style and composition show a strong affinity to the ancient Latin model. But it is significant that the "Novels of Justinian" were composed partly in Greek, as were all the laws of the succeeding period. Of the emperors in the centuries following Justinian, many of course were foreigners, Isaurians, Armenians and others; but in language and education they were all Greeks. In the last five centuries of the empire, under the Comneni and the Palaeologi, court and state are purely Greek.

In spite of the dominant position of Greek in the Eastern empire, a linguistic and national uniformity such as formed the foundation of the old Latin Imperium Romanum never existed there. In the West, with the expansion of Rome's political supremacy, the Latin language and Latin culture were everywhere introduced—first into the non-Latin provinces of Italy, later into Spain, Gaul and North Africa, and at last even into certain parts of the Eastern empire. This Latinizing was so thorough that it weathered all storms, and, in the countries affected by it, was the parent of new and vigorous nationalities, the French, the Spaniards, the Portuguese and the Rumanians. Only in Africa did "Latinism" fail to take root permanently. From the 6th century that province relapsed into the hands of the native barbarians and of the immigrant Arabs, and both the Latin and the Greek influences (which had grown in strength during the period of the Eastern empire) were, together with Christianity, swept away without leaving a trace behind. It might have been expected that the Hellenizing of the political system of the Eastern empire would have likewise entailed the Hellenizing of the non-Greek portions of the empire. Such, however, was not the case; for all the conditions precedent to such a development were wanting. The non-Greek portions of the Eastern empire were not, from the outset, gradually incorporated into the state from a Greek centre, as were the provinces in the West from a Latin centre. They had been acquired in the old period of the homogeneous Latin Imperium. In the centuries immediately following the division of the empire, the idea of Hellenizing the Eastern provinces could not take root, owing to the fact that Latin was retained, at least in principle, as the state language. During the later centuries, in the non-Greek parts, centrifugal tendencies and the destructive inroads of barbarians began on all sides; and the government was too much occupied with the all but impossible task of preserving the political unity of the empire to entertain seriously the wider aim of an assimilation of language and culture. Moreover, the Greeks did not possess that enormous political energy and force which enabled the Romans to assimilate foreign races; and, finally, they were confronted by sturdy Oriental, mostly Semitic, peoples, who were by no means so easy to subjugate as
The influence of Greek culture then, was very slight; how little indeed it penetrated into the oriental mind is shown by the fact that, after the violent Arab invasion in the south-east corner of the Mediterranean, the Copts and Syrians were able to retain their language and their national characteristics, while Greek culture almost completely disappeared. The one great instance of assimilation of foreign nationalities by the Greeks is the Hellenizing of the Slavs, who from the 6th century had migrated into central Greece and the Peloponnese. All other non-Greek tribes of any importance which came, whether for longer or for shorter periods, within the sphere of the Eastern empire and its civilization—such as the Copts, Syrians, Armenians, Georgians, Rumanians, Serbs, Bulgarians, Albanians—one and all retained their nationality and language. The complete Latinizing of the West has, accordingly, no counterpart in a similar Hellenizing of the East. This is clearly shown during the Byzantine period in the Eastern provinces: if in the West, where in the West, even among the non-Romanized Anglo-Saxons, Irish and Germans, Latin maintained its position in the church services and in the other branches of the ecclesiastical system; down to the Reformation the church remained a complete organic unity. In the East, at the earliest period of its conversion to Christianity, several foreign tongues competed with Greek, i.e. Syrian, Coptic, Armenian, Georgian, Gothic, Old-Bulgarian and others. The sacred books were translated into these languages and the church services were held in them and not in Greek. One noticeable effect of this linguistic division in the church was the formation of various sects and national churches (cf. the Coptic Nestorians, the Syrian Monophysites, the Armenian and, in more recent times, the Slavonic national churches). The Church of the West was characterized by uniformity in language and in constitution. In the Eastern Church parallel to the multiplicity of languages developed also a corresponding variety of doctrine and constitution.

The characteristic of Byzantine culture is mainly Greek, and Byzantine literature is attached by countless threads to ancient Greek literature, yet the Roman element is distinctly present. The Western city of the ancient character of the Byzantine empire is, despite its Greek form and colouring, genuinely Roman. Legislation and administration, the military and naval traditions, are old Roman work, and as such, apart from immaterial alterations, they continued to exist and operate, even when the state in head and limbs had become Greek. It is strange, indeed, how strong was the political conception of the Roman state (Staatsgedanke), and with what tenacity it held its own, even under the most adverse conditions, down to the latter days of the empire. The Greeks even adopted the name “Romans,” which gradually became so closely identified with them as to supersede the name “Hellenes”; and thus a political was gradually converted into an ethnographical and linguistic designation. Romanoï (Roman) was the most common popular term for Greeks during the Turkish period, and remains so still. The old glorious name “Helene” was used under the empire and even during the middle ages in a contemptuous sense—“Heathen”—and has only in quite modern times, on the formation of the kingdom of “Helias,” been artificially revived. The vast organization of the Roman political system carried on but exercised in various ways a profound influence upon Byzantine civilization; and it often seemed as if Roman political principles had educated and nerved the unpagan Greek people to great political enterprise. The Roman influence has left distinct traces in the Greek language, Greek of the Byzantine and modern period is rich in Latin terms for conceptions connected with the departments of justice, administration and the imperial court. In literature such “barbarisms” were avoided as far as possible, and were replaced by Greek periphrases.

But by far the most momentous and radical change wrought on the old Hellenism was effected by Christianity; and yet the transition was, in fact, by no means so abrupt as one might be led to believe by comparing the Pagan-Hellenic culture of Plato’s day with the Christian-Byzantine of the time of Justinian. For the path had been most effectually prepared for the new religion by the crumbling away of the ancient belief in the gods, by the humane doctrine of the Stoics, and, finally, by the mystic intellectual tendencies of Neoplatonism. Moreover, in many respects Christianity met paganism halfway by adapting itself to popular usages and demands of the people without in the least impairing its fundamentals.

The whole educational system especially, even in Christian times, was in a very remarkable manner based almost entirely on the methods and material inherited from paganism. Next to the influences of Rome and of Christianity, that of the East was of importance in developing the Byzantine civilization, and in lending Byzantine literature its distinctive character. Much that was oriental in the Eastern empire dates back to ancient times, notably to the period of Alexander the Great and his successors. Since the Greeks had transferred their centre of gravity from Asia Minor to the eastern desert, and had already founded everywhere flourishing cities, they themselves felt under the manifold influences of the soil they occupied. In Egypt, Palestine and Syria, in Asia Minor as far inland as Mesopotamia, Greek and oriental characteristics were often blended. In respect of the wealth and the long duration of its Greek intellectual life, Egypt stands supreme. It covers a period of nearly a thousand years from the foundation of Alexandria down to the conquest of Egypt by the Arabs (a.d. 643). The real significance of Egyptian Hellenism during this long period can be properly estimated only if a practical attempt be made to eliminate from the history of Greek literature and science in pagan and in Christian times all that owed its origin to the land of the Nile. The soil of Egypt proved itself especially productive of Greek literature under the Cross (Origen, Athanasius, Arius, Synesius), in the same way as the soil of North Africa was productive of Latin literature (Tertullian, Cyprian, Lactantius, Augustine). Monastic life, which is one of the chief characteristic elements of Christian-Byzantine civilization, had its birth in Egypt.

Syria and Palestine came under the influence of Greek civilization at a later date than Egypt. In these, Greek literature and culture attained their highest development between the 3rd and the 8th centuries of the Christian era. Antioch rose to great influence, owing at first to its pagan school of rhetoric and later to its Christian school of exegesis. Gaza was renowned for its school of rhetoric; Berytus for its academy of law. It is no mere accident that sacred poetry, aesthetically the most valuable class of Byzantine literature, was born in Syria and Palestine.

In Asia Minor, the cities of Tarsus, Caesarea, Nicaea, Smyrna, Ephesus, Nicopolis, &c. were all influential centres of Greek culture and literature. For instance, the three great fathers of Cappadocia, Basil, Gregory of Nyssa, and Gregory of Nazianzus all belonged to Asia Minor.

If all the greater Greek authors of the first eight centuries of the Christian era, i.e. the period of the complete development of Byzantine culture, be classified according to the countries of their birth, the significant fact becomes evident that nine-tenths come from the African and Asiatic districts, which were for the most part opened up only after Alexander the Great, and only one-tenth from European Greece. In other words, the old original European Greek was, under the emperors, completely outstripped in intellectual productive force by the newly founded African and Asiatic Greece. This huge tide of conquest which surged from Greece over African and Syrian territories occupied largely by foreign races and ancient civilizations, could not fail to be fraught with serious consequences for the Greeks themselves. The experience of the
Romans in their conquest of Greece (Graecia capta ferum victorem cepit) repeated itself in the conquest of the East by Greece, though to a minor extent and in a different way. The whole literature of Egypt, Syria and Asia Minor cannot, despite its international and cosmopolitan character, dissuow the influence of the Oriental soil on which it was nourished. Yet the growth of too strong a local colouring is its literature was prevented, partly by the checks imposed by ancient Greek tradition, partly by the spirit of Christianity which reconciled all national distinctions. Even more clearly and unmistakably is Oriental influence shown in the province of Byzantine art, as Joseph Strzygowski has conclusively proved.

The greater portion of Greek literature from the close of ancient times down to the threshold of modern history was written in a language identical in its principal features with the common literary language, the so-called Koine, which had its origin in the Alexandrian age. This is the literary form of Greek as a universal language, though a form that scintillates with many facets, from an almost Attic diction down to one that approaches the language of everyday life such as we have, for instance, in the New Testament. From what has already been said, it follows that this stable literary language cannot always have remained a language of ordinary life. For, like every living tongue, the vernacular Greek continually changed in pronunciation and form, and the living language surely ane gradually separated itself from the rigid written language. This gulf was, moreover, accentuated by the tendency of the church fathers, which took place in the written language a retrograde movement, the so-called "Atticism." Introduced by Dionysius of Halicarnassus in the 1st century before Christ, this linguistic-literary fashion attainted its greatest height in the 2nd century A.D., but still continued to flourish in succeeding centuries, and, indirectly, throughout the whole Byzantine period. It is true that it often seemed as though the living language would be gradually introduced into literature; for several writers, such as the chronicler Malalas in the 6th century, Leontius of Neapolis (the author of Lives of Saints) in the 7th century, the chronicler Theophanes at the beginning of the 9th century, and the emperor Constantine Porphyrogenitus in the 10th century, made in their writings numerous concessions to the living language. This progressive tendency might well have led, in the 11th and 12th centuries, to the founding in the Greek vernacular of a new literary language similar to the promising national languages and literature which, at that period, in the Romance countries, developed out of the despaired popular idiom. In the case of the Byzantines, unfortunately, such a radical change never took place. But attempts in the direction of a popular reform of the literary language, which were occasionally made in the period from the 6th to the 10th centuries, were in turn extinguished by the resuscitation of classical studies, a movement which, begun in the 9th century by Photius and continued in the 11th by Psellus, attained its full development under the Comneni and the Palaeologi. This classical renaissance turned back the literary language into the old ossified forms, as had previously happened in the case of the Atticism of the early centuries of the empire. In the West, humanism (so closely connected with the Church) under the Comneni and the Palaeologi also artificially reproduced the "Ciceronian" Latin, but was unable seriously to endanger the development of the national languages, which had already attained to full vitality. In Byzantium, the humanistic movement came prematurely, and crushed the new language before it had fairly established itself. Thus the language of the Byzantine writers of the 11th-15th centuries is almost Old Greek in colour; artificially learnt by grammar, lexicon and assiduous reading, it followed Attic models more and more slavishly; to such an extent that, in determining the date of works, the paradoxical principle holds good that the more ancient the language, the more recent the author.

Owing to this artificial return to ancient Greek, the contrast that had long existed with the vernacular was now for the first time fully revealed. The gulf between the two forms of language could no longer be bridged; and this fact found its expression in literature also. While the vulgarizing authors of the 6th-10th centuries, like the Latin-writing Franks (such as Gregory of Tours), still attempted a compromise between the language of the schools and that of conversation, we meet after the 12th century with authors who freely and naturally employed the vernacular in their literary works. They accordingly form the Greek counterpart of the oldest writers in Italian, French and other Romance languages. That they could not succeed like their Roman colleagues, and always remained the pariahs of Greek literature, is due to the all-powerful philological-antiquarian tendency which existed under the Comneni and the Palaeologi. Yet once more did the vernacular attempt to assert its literary rights, i.e. in Crete and some other islands in the 16th and 17th centuries. But this attempt also was foiled by the classical reaction of the 19th century. Hence it comes about that Greek literature even in the 20th century employs grammatical forms which were obsolete long before the 10th century. Thus the Greeks, as regards their literary language, came into a cul de sac similar to that in which certain rigidly conservative Oriental nations find themselves, e.g. the Arabs and Chinese, who, not possessing a literary language suited to modern requirements, have to content themselves with the dead Old-Arabic or the ossified Mandarin language. The divorce of the written and spoken languages is the most prominent and also the most fatal heritage that the modern Greeks have received from their Byzantine antecedents.

The whole Byzantine intellectual life, like that of the Western medieval period, is dominated by theological interests. Theology accordingly, in literature too, occupies the chief place, in regard to both quantity and quality. Next to it comes the writing of history, which the Byzantines cultivated with great conscientiousness until after the fall of the empire. All other kinds of prose writing, e.g. in geography, philosophy, rhetoric and the technical sciences, were comparatively neglected, and such works are of value for the most part only so far as they preserve and interpret old material. In poetry, again, theology takes the lead. The poetry of the Church produced works of high aesthetic merit and enduring value. In secular poetry, the writing of epigrams especially was cultivated with assiduity and often with ability. In popular literature poetry predominates, and many productions worthy of notice, new both in matter and in form, are here met with.

The great classical period of Greek theological literature is that of the 4th century. Various factors contributed to this result—some of them positive, particularly the establishment of Christianity as the official religion of the empire and the protection it enjoyed against official persecution. The intellectual movement of this century, stand the three great Cappadocians, Basil the Great, the subtile dogmatist, his brother Gregory of Nyssa, the philosophically trained defender of the Christian faith, and Gregory of Nazianzus, the distinguished orator and poet. Closely allied to them was St Chrysostom, the courteous champion of ecclesiastical liberty and of moral purity. To modern readers the greater part of this literature appears strange and foreign; but, in order to be appreciated rightly, it must be regarded as the outcome of the period in which it was produced, a period into which it was infused by religious emotions. For the times in which they lived and for their readers, the Greek fathers reached the highest attainable; though, of course, they produced nothing of such general human
interest, nothing so deep and true, as the Confessions of St Augustine, with which the poetical autobiography of Gregory of Nazianzus cannot for a moment be compared.

The glorious bloom of the 4th century was followed by a perceptible decay in theological intellectual activity. Independent production was in succeeding centuries almost solely prompted by divergent dogmatical views and heresies, for the refutation of which orthodox authors were impelled to take up the pen. In the 5th and 6th centuries a more copious literature was called into existence by the Monophysites, who maintained that there was but one nature in Christ; in the 7th century by the Monothelites, who acknowledged but one will in Christ; in the 5th century by the Iconoclasts, who was followed by the Nestorians and Izopoules, and in the 8th century by the Monothelites and Mahometans. One very eminent theologian, whose importance it has been reserved for modern times to estimate aright—Leontius of Byzantium (6th century)—was the first to introduce Aristotelian definitions into theology, and may thus be called the first scholastic. In his works he attacked the heretics of his age, particularly the Monophysites, who were also assailed by his contemporary Anastasius of Antioch. The chief adversaries of the Monothelites were Sophronius, patriarch of Jerusalem (whose main importance, however, is due to his role in the other fifth-century quarrel between the Latins and the Greeks; he composed the Confessor, and Anastasius Sinaite, who also composed an interpretation of the Hexaemeron in twelve books. Among writers in the departments of critical interpretation and asceticism in this period must be enumerated Procopius of Gaza, who devoted himself principally to the exegesis of the Old Testament; Johannes Climax (6th century), named after his much-read ascetic work Klimax (Jacob's ladder); and Johannes Moschus (d. 619), whose chief work Leitmenos ("spiritual pasture") describes monastic life in the form of statements and narratives of their experiences by monks themselves. The last great heresy, which shook the Greek Church to its very foundations, the Iconoclast movement, summoned to the fray the last great Greek theologian, John of Damascus (Johannes Damascenus). Yet his chief merit lies not so much in his polemical speeches against the Iconoclasts, and in his much admired but over-refined poetry, as in his great dogmatic work, The Fountain of Knowledge, which contains the first comprehensive exposition of Christian dogma. It has remained the standard work on Greek theology down to the present day. Just as the internal development of the Greek Church in all essentialas reached its limit with the Iconoclasts, so also its productive intellectual activity ceased with John of Damascus. Such theological works as were subsequently produced, consisted mostly in the interpretation and revision of old materials. An extremely copious, but unfruitful, literature was produced by the disputes about the reunion of the Greek and Roman Churches. Of a more independent character is the literature which in the 14th century centred round the dissensions of the Hesychasts.

Among theologians after John of Damascus must be mentioned: the emperor Leo VI, the Wise (886–911), who wrote numerous homilies and church hymns, and Theodorus of Studium (750–826), who in his numerous writings affords us instructive glimpses of monastic life. Pre-eminent stands the figure of the patriarch Photius. Yet his importance consists less in his writings, which often, to a remarkable extent, lack independence of thought and judgment, than in his activity as a prince of the church. For he was who carried the differences which had already repeatedly arisen between Rome and Constantinople to a point at which reconciliation was impossible, and was mainly instrumental in preparing the way for the separation of the Greek and Latin Churches accomplished in 1054 under the patriarch Michael Cerularius. In the 11th century the polyhistor Michael Psellus also wrote polemics against the Euchites, among whom he was the Syrian Gnosis was reviving. All literature, including theology, experienced a considerable revival under the Comneni. In the reign of Alexis T. Comnenus (1081–1118), Euthymius Zigabenus wrote his great dogmatic work, the Dogmatic Panoply, which, like The Fountain of Knowledge of John of Damascus in earlier times, was equally positive, furnishing an armoury of theology, partly negative and directed against the sects. In addition to attacking the dead and buried doctrines of the Monothelites, Iconoclasts, &c., to fight which was at this time a mere tilting at windmills, Zigabenus also continued on a polemic against the heretics of his own day, the Armenians, Bogomils and Saracens. Zigabenus' Panoply was continued and enlarged a century later by the historian Nicetas Acominatus, who published it under the title Treasure of Orthodoxy. To the writings against ancient heresies were next added a flood of tracts, of all shapes and sizes, "against the Latins," i.e. against the Roman Church, and among their authors must also be mentioned an emperor, the gifted Theodore II. Lascaris (1254–1282). The chief champion of the Nicene Church was the learned Johannes Becclus (patriarch of Constantinople 1275–1282). Of his opponents by far the most eminent was Gregory of Cyprus, who succeeded him on the patriarchal throne. The fluctuations in the fortunes of the two ecclesiastical parties are reflected in the occupation of the patriarchal throne. The battles round the question of the union, which were waged with southern passion, were for a while checked by the dissensions aroused by the mystical tendency of the Hesychasts. The impetus to the revival of the literary movement was given by the monk Barlaam, a native of Calabria, who, between 1265 and 1275, wrote his famous work, The Klimax or Ladder, in which he sought to give a dogmatic foundation to the mysticism of the Hesychasts, Cabasilas, and the emperor John VI. Cantacuzenus who, after his deposition, sought, in the peaceful retreat of a monastery, consolation in theological studies, and in his literary works refuted the Jews and the Mahomedans. For the greatest Byzantine "apologia" against Islamism we are indebted to an emperor, Manuel II. Palaeologus (1319–1425), who by learned discussions tried to make up for the deficiency in martial prowess shown by the Byzantines in their struggle with the Turks. On the whole, theological literature in the last century of the empire was almost completely occupied with the struggles for and against the union with Rome. The reason lay in the political conditions. The emperors saw more and more clearly that without the aid of the West they would no longer be able to stand their ground against the Turks, the vanguard of the armies of the Crescent; while the majority of Byzantine theologians feared that the assistance of the West would force the Greeks to unite with Rome, and thereby to forfeit their ecclesiastical independence. Considering the supremacy of the theological party in Byzantium, it was but natural that religious considerations should gain the day over political; and this was the view almost universally held by the Byzantines in the later centuries of the empire; in the words of the chronicler Ducas: "it is better to fall into the hands of the Turks than into those of the Franks." The chief opponent of the union was Marcus Eugenicus, metropolitan of Ephesus, who, at the Council of Florence in 1439, denounced the union with Rome accomplished by John VIII. Palaeologus. Conspicuous there among the partisans of the union, by reason of his erudition and general literary merit, was Bessarion, afterwards cardinal, whose chief activity already falls under the head of Graeco-Italian humanism.

Hagiography, i.e. the literature of the acts of the martyrs and the lives of the saints, forms an independent group and one comparatively unaffected by dogmatic struggles. The main interest centres here round the objects described, the personalities of the martyrs and saints themselves. The authors, on the other hand—the Acts of the Martyrs are mostly anonymous—keep more in the background than in other branches of literature. The man whose name is...
mainly identified with Greek hagiography. Symeon Metaphrasinges, is important not as an original author, but only as an editor. Symeon revised in the 9th century, according to the rhetorical and linguistic principles of his day, numerous old Acts of the Martyrs, and incorporated them in a collection consisting of several volumes, which was circulated in innumerable copies, and thus to a great extent superseded the older original texts. These Acts of the Martyrs, in point of time, are anterior to our period; but of the Lives of Saints the greater portion belong to Byzantine literature. They began with biographies of monks distinguished for their kindly living, such as were used by Palladius abbot in his Historia Lausiacca. The most famous work of this description is that by Athanasius of Alexandria, viz. the biography of St Anthony, the founder of monachism.

In the 6th century Cyril of Scythopolis wrote several lives of saints, distinguished by a simple and straightforward style. More expert than any one else in reproducing the naïve popular style was Leontius of Neapolis in Cyprus who, in the 7th century, wrote, among other works, a life of St John the Merciful, archbishop of Alexandria, which is very remarkable as illustrating the social and intellectual conditions of the time. From the popular Lives of Saints which he wrote, the religious writers of the middle ages formed the chief substitute for modern "belles lettres," it is easy to trace the transition to the religious novel. The most famous work of this class is the history of Barlaam and Josaphat (q.v.).

Religious poetry.

The religious poetry of the Greeks primarily suffered from the influence of the ancient Greek form, which was fatal to original development. The oldest work of this class is the hymn, composed in anaepitactic monometers and dimeters, which was handed down in the manuscripts of the 10th century (d. about 1113) but was probably not his work. The next piece of this class is the famous "Maidens' Song" in the Banquet of St Methodius (d. about 311), in which many striking violations of the old rules of quantity are already apparent. More faithful to the tradition of the school was Gregory of Nazianzus. But, owing to the fact that he generally employed antiquated versification and very erudite language, his poems failed to reach the people or to find a place in the services of the church. Just as little could the artificial paraphrase of the Psalms composed by the younger Apollinaris, or the subtile poems of Synesius, appeal to the popular. It became more and more patent that, with the archaic metre which was out of keeping with the character of the living language, no genuine poetry suited to the age could possibly be produced. Fortunately, an entirely new form of poetical art was discovered, which conferred upon the Greek people the blessings of an intelligible religious poetry—the rhythmic poem. This no longer depended on difference of quantity in the syllables, which had disappeared from the living language, but on the accent. Yet the transition was not effected by the substitution of accent for the old long syllables; the ancient verse form was entirely abandoned, and in its stead new and variously constructed lines and strophes were formed. In the history of the rhythmical sacred poetry three periods are clearly marked—the preparatory period; that of the hymns; and that of the Canones. About the first period we know, unfortunately, comparatively little. It appears that in church music was in the main confined to the insertion of short songs between the Psalms or other portions of Holy Writ and the acclamations of the congregation. The oldest rhythmical songs date from Gregory of Nazianzus—his "Maidens' Song" and his "Evening Hymn." Church poetry reached its highest expression in the second period, in the grand development of the hymns, i.e. lengthy songs comprising from twenty to thirty similarly constructed strophes, each connected with the next in acrostic fashion. Hymnology, again, attained its highest perfection in the first half of the 6th century with Romanos, who in the great number and excellence of his hymns dominated this species of poetry, as Homer did the Greek epic. From this period dates, moreover, the most famous song of the Greek Church, the so-called Acalistus, an anonymous hymn of praise to the Virgin Mary, which has sometimes, but erroneously, been attributed to the patriarch Sergius.

Church poetry entered upon a new stage, characterized by an increase in artistic finish and a falling off in poetic vigour, with the composition of the Canones, songs artfully built up out of eight or nine lyrics, all differently constructed. Andreas, archbishop of Crete (c. 650–720), is regarded as the inventor of this new class of song. His chief work, the "great Canon," comprises no less than 250 strophes. The most celebrated writers of Canones are John of Damascus and Cosmas of Jerusalem, both of whom flourished in the first half of the 8th century. "Vulgar" spirituality of Romanos was regarded by them as an obsolete method; they again resorted to the classical style of Gregory of Nazianzus, and John of Damascus even took a special delight in the most elaborate tricks of expression. In spite of this, or perhaps on that very account, both he and Cosmas were much admired in later times, were much read, and—as was very necessary—much commended. Later, sacred poetry was more particularly cultivated in the monastery of the Studium at Constantinople by the abbot Theodorus and others. Again, in the 9th century, Joseph, "the old man of the desert," who lived from 800 to 876, and, which is without doubt the work of the famous Syriac writer bar electric (11th century), bishop of Euchaita, John Zonaras (12th century), and Nicephorus Blemydies (13th century), were also distinguished as authors of sacred poems, i.e. Canones. The Basilian Abbey of Grotta Ferrata near Rome, founded in 1004, and still existing, was also a nursery of religious poetry. As regards the rhythmical church poetry, it may now be regarded as certain that its origin was in the East. Old Hebrew and Syrian models mainly stimulated it, and Romanos (q.v.) was especially influenced by the metrical homilies of the great Syrian father Ephraem (d. about 373).

In profane literature the writing of history takes the first place, as regards both form and substance. The Greeks have always been deeply interested in history, and they have never omitted, amid all the vicissitudes of their existence, to hand down a record to posterity. Thus, they have produced a literature extending from the Ionian logarithographers and Herodotus down to the times of Sultan Mahomed II. In the Byzantine period all historical accounts fall under one of two groups, entirely different, both in form and in matter. (1) Historical works, the authors of which are described, as did most historians of ancient times, a period of history in which they themselves had lived and moved, or one which only immediately preceded their own times; and (2) chronicles, shortly recapitulating the history of the world. This latter class has no exact counterpart in ancient literature. The most clearly marked stage in the development of a Christian-Byzantine universal history was the chronicle (unfortunately lost) written by the Hellenized Jew, Justus of Tiberias, at the beginning of the 2nd century of the Christian era; this work began with the story of Moses.

Byzantine histories of contemporary events do not differ substantially from ancient historical works, except in their Christian colouring. Yet even this is often very faint and blurred owing to close adherence to ancient methods. Apart from this, neither a new style nor a new critical method nor any radically new views appreciably altered the main character of Byzantine historiography. In their style most Byzantine compilers of contemporary history followed the beaten track of older historians, e.g. Hesychius, Thucydides, and, in some details, also Polybius. But, in spite of their often excessive tendency to imitation, they displayed considerable power in the delineation of character and were not wanting in independent judgment. As regards the selection of their matter, they adhered to the old custom of beginning their narrative where their predecessors left off.

The outstripping of the Latin West by the Greek East, which after the close of the 4th century was a self-evident fact, is reflected in historiography also. After Constantine the Great, the history of the empire, although its Latin character was maintained until the 6th century, was mostly written by Greeks;
these two qualities that the chronicles obtained a circulation abroad, both in the West and also among the peoples Christianized from Byzantium, e.g. the Slavs, and in all of them sowed the seeds of an indigenous historical literature. Thus the chronicles, despite the jejuneness of their style and their uncritical treatment of the general culture of the middle ages, have greater importance than the erudite contemporary histories designed only for the highly educated circles in Byzantium. The oldest Byzantine chronicle of universal history preserved to us is that of Malalas (6th century), which is also the purest type of this class of literature. In the 7th century was completed the famous Easter or Paschal Chronicle (Chronicum Paschale). About the end of the 8th or the beginning of the 9th century Georgius Syncellus compiled a concise chronicle, which began with the Creation and was continued down to the year 784. In the request of the author, when on his death-bed, the continuation of this work was undertaken by Theophanes Confessor, who brought down the account from A.D. 284 to his own times (A.D. 813). This exceedingly valuable work of Theophanes was again continued (from 813 to 961) by several anonymous chroniclers. A contemporary of Theophanes, the patriarch Nicephorus, wrote, in addition to a Short History of the period from 692 to 769, a chronological sketch from Adam down to the year of his own death in 829. Of great influence on the age that followed was Georgius Monachus, only second in importance as chronicler of the early Byzantine period, who compiled a chronicle of the world's history (from Adam until the year 843, the end of the Iconoclast movement), far more theological and monkish in character than the work of Theophanes. Among later chroniclers Johannes Scylitzas stands out conspicuously. His work (covering the period from 811 to 1057), as regards the range of its subject-matter, is something between a universal and a contemporary history. Georgius Cedrenus (c. 1100) embodied the whole of Scylitzas's work, almost unaltered, in his Universal Chronicle. In the 12th century the general increase in interest in history was reflected in the development of chronicles of the world. From this period dates, for instance, the most distinguished and learned work of this class, the great universal chronicle of John Zonaras. In the same century Michael Glycas compiled his chronicle of the world's history, a work written in the old popular style and designed for the widest circles of readers. Lastly, in the 12th century, Constantine Manasses wrote a universal chronicle in the so-called "political" verse. With this verse-chronicle must be classed the imperial chronicle of Ephraem, written in Byzantine trimeters at the beginning of the 14th century.

Geography and topography, subjects so closely connected with history, were as much neglected by the Byzantines as by their political forerunners, the Romans. Of purely practical importance are a few handbooks of navigation, itineraries, guides for pilgrims, and catalogues of provinces and cities, metropolitan sees and bishoprics. The geographical work of Stephanus of Byzantium, which dates from Justinian's time, has been lost. To the same period belongs the only large geographical work which has been preserved to us, the Christian Topography of Cosmas Indicopleustes. For the topography of Constantinople a work entitled Ancient History (Patria) of Constantinople, which may be compared to the medieval Mirabilia urbis Romae, and in late manuscripts has been wrongly attributed to a certain Codinus, is of great importance.

Ancient Greek philosophy under the empire sent forth two new shoots—Neopythagoreanism and Neoplatonism. It was the latter with which moribund paganism essayed to stem the advancing tide of Christianity. The last great exponent of this philosophy was Proclus in Athens (d. 485). The dissolution, by order of Justinian, of the school of philosophy at Athens in 529 was a fatal blow to this nebulous system, which had long since outlived the conditions that made it a living force. In the succeeding period philosophical activity was of two main kinds; on the one hand, the old philosophy, e.g. that of Aristotle, was employed to systematize Christian

1 See Ad. Bauer and J. Strzygowski, "Eine alexandrinische Welchronik" (1905) (Denkschrift der kaiserlich. Akademie der Wissenschaften, III).
Byzantine literature had already introduced Aristotelian definitions into Christology; but the real founder of medieval ecclesiastical philosophy was John of Damascus. Owing, however, to his having early attained to canonical authority, the independent progress of ecclesiastical philosophy was arrested; and to this it is due that in this respect the later Byzantine period is far poorer than is the West. Byzantium cannot boast a scholastic like Thomas Aquinas. In the 11th century philosophical studies experienced a satisfactory revival, mainly owing to Michael Psellus, who brought Plato as well as Aristotle again into fashion.

Ancient rhetoric was cultivated in the Byzantine period with greater ardour than scientific philosophy, being regarded as an indispensable aid to instruction. It would be difficult to imagine anything more tedious than the numerous theoretical writings on the subject and the examples of their practical application: mechanical school essays, which here count as "literature," and innumerable letters, the contents of which are wholly insignificant. The evil effects of this were felt beyond the proper sphere of rhetoric. The anxious attention paid to the laws of rhetoric and the unrestricted use of its withered flowers were detrimental to a great part of the rest of Byzantine literature, and greatly hampered the development of any individuality and simplicity of style. None the less, among the rhetorical productions of the time are to be found a few interesting pieces, such as the Philopatris, in the style of Lucian, which gives us a remarkable picture of the times of Nicephorus Phocas (10th century). In two other smaller works a journey to the dwellings of the dead is described, after the pattern of Lucian's Nekyomanteia, viz. in Timarion (12th century) and in Mazaris' Journey to the Underworld (c. 1414). A very charming representative of Byzantine rhetoric is Michael Acominatus, who, in addition to theological works, wrote numerous occasional speeches, letters and poems.

In the field of scientific production, which can be accounted literature in the modern acceptance of the term only in a limited sense, Byzantium was dominated to an extravagant and even grotesque extent by the rules of what in modern times is termed "classical scholarship." The numerous works which belong to this category, such as grammars, dictionaries, commentaries on ancient authors, extracts from ancient literature, and metrical and musical treatises, are of little general interest, although of great value for special branches of philological study, e.g. for tracing the influences through which the ancient works handed down to us have passed, as well as for their interpretation and emendation; for information about ancient authors now lost; for the history of education; and for the underlying principles of intellectual life in Byzantium. The most important monument of Byzantine philology is, perhaps, the Library of the patriarch Photius. The period from about 850 to 890 is marked by a general decay of culture. Photius, who in the year 890 was about thirty years of age, now set himself with admirable energy to the task of making ancient literature, now for the most part dead and forgotten, known once more to his contemporaries, thus contributing to its preservation. He gave an account of all that he read, and in this way composed 280 essays, which were collected in what is commonly known as the Library or Myribiblion. The character of the individual sketches is somewhat mechanical and formal; a more or less complete account of the contents is followed by critical discussion, which is nearly always confined to the linguistic form. With this work Photius laid the foundation of modern Byzantine literary history. In 911 a Syrian, Suidas, which appeared about a century later, a sort of encyclopaedia, of which the main feature was its articles on the history of literature. A truly sympathetic figure is Eustathius, the famous archbishop of Thessalonica (12th century). His voluminous commentaries on Homer, however, rivet the attention less than his enthusiastic devotion to science, his energetic action on behalf of the preservation of the literary works of antiquity, and last, not least, his frank and heroic character, which had nothing in it of the Byzantine. If, on the other hand, acquaintance with a caricature of Byzantine philology be desired, it is afforded by Johannes Tzetzes, a contemporary of Eustathius, a Greek in neither name nor spirit, narrow-minded, angular, superficial, and withal immeasurably conceited and ridiculously coarse in his polemics. The transition to Western humanism was effected by the philologists of the period of the Palaeologoi, such as Maximus Planudes, whose translations of numerous works renewed the long-broken ties between Byzantium and the West; Manuel Moschopulius, whose grammatical works and commentaries were, down to the 16th century, used as school-textbooks; Demetrius Trincinus, distinguished as a textual critic; the versatile Theodorus Metochites, and others.

Originally, as is well known, Latin was the exclusive language of Roman law. But with Justinian, who codified the laws in his Corpus juris, the Hellenizing of the legal language also began. The Institutes and the Digest were translated into Greek, and the Novels also were issued in a Greek form. Under the Macedonian dynasty there began, after a long stagnation, the resuscitation of the code of Justinian. The emperor Basilissus I. (867–886) had extracts made from the existing law, and made preparations for the codifying of all laws. But the whole work was not completed till the time of Leo VI. (886–912), and Constantine VII. Porphyrogenitus (912–959), when it took the form of a grand compilation from the Digests, the Codex, and the Novels, and is commonly known as the Basilica (Τὰ Βασιλικά). In the East it completely superseded the old Latin Corpus juris of Justinian. More that was new was produced, during the Byzantine period, in canon law than in secular legislation. The purely ecclesiastical rules of law, the Canones, were blended with those of civil law, and thus arose the so-called Nomocanon, the most important edition of which is that of Theodorus Besten in 1360. The alphabetical handbook of canon law written by Matthias Blastares about the year 1335 also exercised a great influence.

In the province of mathematics and astronomy the remarkable fact must be recorded that the revival among the Greeks of these long-forgotten studies was primarily due to Perso-Arabian influence. The Great Synaxis of Ptolemy operated in the oriental guise of the Almagest. The most important direct source of this intellectual loan was not Arabia, however, but Persia. Towards the close of the 13th century the Greeks became acquainted with Persian astronomy. At the beginning of the 14th century Georgius Chrysocoeca and Isaac Argyrus wrote astronomical treatises based on Persian works. Then the Byzantines themselves, notably Theodorus Metochites and Nicephorus Gregoras, at last had recourse to the original Greek sources.

The Byzantines did much independent work in the field of military science. The most valuable work of the period on this subject is one on tactics, which has come down to posterity associated with the name of Leo VI., the Wise.

Of profane poetry—complete contrast to sacred poetry—the general characteristic was its close imitation of the antique in point of form. All works belonging to this category reproduce the ancient style and are framed after ancient models. The metre is, for the most part, either the Byzantine regular twelve-syllable trimeter, or the "political" verse; more rarely the heroic and Anacreontic measures.

Epic popular poetry, in the ancient sense, begins only with the vernacular Greek literature (see below); but among the works of the Byzantine period of the 10th century, the great literature of this period, some works can be compared with the epics of the Alexandrine age. Nonnus (c. 400) wrote, while yet a pagan, a fantastic epic on the triumphal progress of the god Dionysus to India, and, as a Christian, a voluminous commentary on the gospel of St John. In the 7th century, Georgius Pisides sang in several lengthy iambic poems the mortal deeds of the emperor Heraclius, while the deacon Theodosius (10th century) imbued inollective manner the victories of the brave Nicephorus Phocas.
GREEK LITERATURE

From the 11th century onwards, religious, grammatical, astrological, medical, historical and allegorical poems, framed partly in duodecasyllables and partly in "political" verse, made their appearance in large quantities. Didactic religious poems were composed, for example, by Philippus (δ Μονοτροχος, Solitarius, c. 1100), grammatico-philosophical poems by Johannes Tzetzes, astronomical by Johannes Camaterus (11th century), others on natural science by Manuel Philes (12th century) and a great moral, allegorical, didactic epic by Georgios Lapithes (12th century).

To these may be added some voluminous poems, which in style and matter must be regarded as imitations of the ancient Romances. Greek romances. They all date from the 12th century, a fact evidently connected with the general revival of culture which characterizes the period of the Comneni. Two of these romances are written in the duodecasyllable metre, viz. the story of Rodanthe andDosicles by Theodorus Prodromus, and an imitation of this work, the story of Drussilia and Charicdes by Nicetas Eugenianus; one in "political" verse, the love story of Aristander and Callithrea by Constantine Manasses, which has only been preserved in fragments, and lastly one in prose, the story of Hysmine and Hysminias, by Eustathius (or Eumathius) Macrembolita, which is the most insipid of all.

The subjective point of view which dominated the whole Byzantine period was fatal to the development of a profane lyrical poetry. At most a few poems by Johannes Geometres and Christophorus of Mytilene and others, in which personal experiences are recorded with some show of taste, may be found. In this domain the epigram for all subjective poetry was the epigram, which was employed in all its variations from playful trifles to long elegiac and narrative poems. Georgios Psalides (7th century) treated the most diverse themes. In the 9th century Theodorus of Studium had lighted upon the happy idea of immortalizing monastic life in a series of epigrams. The same century produced the only poetess of the Byzantine period, Caisa, from whom we have several epigrammatic productions and church hymns, all characterized by originality. Epigrammatic poetry reached its highest development in the 10th and 11th centuries, in the productions of Johannes Geometres, Christophorus of Mytilene and John Mauropus. Less happy are Theodorus Prodromus (12th century) and Manuel Philes (14th century). From the beginning of the 10th century also dates the most valuable collection of ancient and of Byzantine epigrammatic poems, the Anthologia Palatina (see Anthology).

Dramatic poetry, in the strict sense of the term, was as completely lacking among the Byzantine Greeks as was the condition precedent to its existence, namely, public plays performed in a publicized manner. The most characteristic of these was the Sufferings of Christ (Χριστός Παράξεια). This work, written probably in the 12th century, or at all events not earlier, is a cenot, i.e. in great measure composed of verses culled from ancient writers, e.g. Aeschylus, Euripides and Lycophron; but it was certainly not written with a view to the dramatic production.

The vernacular literature stands alone, both in form and in contents. We have here remarkable originality of conception and probably also entirely new and genuinely medieval matter. While in the artificial literature prose is pre-eminent, in the vernacular literature, poetry, both in quantity and quality, takes the first place, as was also the case among the Latin nations, where the vulgar tongue first invaded the field of poetry and only later that of prose. Though a few preliminary attempts were made (proverbs, acclamations addressed by the people to the emperor, &c.), the Greek vernacular was employed for larger works only from the 11th century onwards; at first in poems, of which the major portion were cast in "political" verse, but some in the trochaic eight-syllabled line. Towards the close of the 12th century rhyme came into use. The subjects treated in this vernacular poetry are exceedingly diverse. In the capital city a mixture of the learned and the popular language was first used in poems of admonition, praise and supplication. In this oldest class of "vulgar" works must be reckoned the Spanias, an admonitory poem in imitation of the letter of Pseudo-Iscorates addressed to Demonicus; a supplicative poem composed in prison by the chronicler Michael Gleys, and several begging poems of Theodosius Prodromus (Ptochoprodromos). In the succeeding period such poems are met with, such as the Rhodian love songs preserved in a MS. in the British Museum (ed. W. Wagner, Leipzig, 1879), fairy-tale-like romances such as the Story of Ptochokoelon, oracles, prayers, extracts from Holy Writ, lives of saints, &c. Great epic poems, in which antique subjects are treated, such as the legends of Troy and of Alexander, form a separate group. To these may be added romances in verse after the manner of the works written in the artificial classical language, e.g. Callimachus and Chrysorkeös, Belhindrus and Chrysantos, Lybistrus and Rhodamne, also romances in verse after the Western pattern, such as Philius and Plastophilo (the old French story of Flore et Blanchefleur). Curious are also sundry legends connected with animals and plants, such as an adaptation of the famous medieval animal fables of the Physiologus, a history of quadrupeds, and a book of birds, both written with a satirical intention, and, lastly, a rendering of the story of Reynard the Fox. Of quite peculiar originality also are several legendary and historical poems, in which famous heroes and historical events are celebrated. There are, for instance, poems on the fall of Constantinople, the taking of Athens and Trebizond, the devastating campaign of Timur, the plague in Rhodes in 1498, &c. In respect of importance and antiquity the great heroic epic of Digenis Akrites stands pre-eminent.

Among prose works written in the vulgar tongue, or at least in a compromise with it, may be mentioned the Greek rendering of two works from an Indian source, the Book of the Seven Wise Masters (as Syniippas the Philosopher by "Vulgar" Michael Andreopulos), and the Histoepedia or Mirror works of Princes (through the Arabic Kalila et Dimnak by Simeon Sethus as Σφοιγνιν και ειρήμνος, in a fish book, a frieze book (both skits on the Byzantine court and official circles). To these must be added the Greek laws of Jerusalem and of Cyprus of the 12th and 13th centuries, chronicles, &c. In spite of many individual successes, the literature written in the vulgar tongue succumbed, in the race for existence, to its elder sister, the literature written in classical and polished Greek. This was mainly due to the continuous employment of the ancient language in the state, the schools and the church.

The importance of Byzantine culture and literature in the history of the world is beyond dispute. The Christians of the Eastern empire were the first to recognize the importance of the great classical and formal works of antiquity against the violent onslaught of the barbarians. They also called for a life peculiar medieval culture and literature. They communicated the treasures of the old pagan as well as of their own Christian literature to neighbouring nations; first to the Syrians, then to the Greeks, the Armenians, the Georgians; later, to the Arabs, the Bulgarians, the Serbs and the Russians. Through their teaching they created a new East European culture, embodied above all in the Russian Church, on the religious side, including in the Orthodox Eastern Church, and from the point of view of nationality touches the two extremes of Greek and Slav. Finally the learned men of the dying Byzantine empire, fleeing from the barbarism of the Turks, transplanted the treasures of old Hellenic wisdom to the West, and thereby fertilized the Western peoples with rich germes of culture.

BIBLIOGRAPHY.—1. General sources: K. Krumbacher, Geschichte der byzantischen Literatur (and ed., 1897), supplemented in Die byzantinische Zeitschrift (1892 seq.), and the Byzantinisches Archiv (1898 seq.), which is intended for the publication of more exhaustive matter. The Russian works in this department are comprised in the Byzantinskii Vestnik (1894 seq.).

Historical Literature: A collective edition of the Byzantine historians and chroniclers was begun under Louis XIV. and continued later (1648-1819), called the Paris Corpus. This whole collection was on B. C. Niebuhr's advice republished with some additions (Bonn, 1828-1879), under the title Corpus scriptorum historiae Byzantinae. The most important authors have also appeared in the Bibliotheca Teubneriana. A few Byzantine and oriental historical works are also contained in the collection edited by J. B. Bury (1858 seq.).

5. Vernacular Literature: The most important collective edition are the AnthologiaeMedio Graeci or Anthologia Graeci Mediae Antiquae (1747). Anthologiae Graeci Mediae Antiquae (1747). Trois Poemes grecs du moyen age (1881); E. Legrand, Collection de monuments pour servir a l'etude de la langue nato-hellenique (in 26 parts, 1869-1875), Bibliotheca grecque vulgaire (in 8 vols., 1860-1890).

III. Modern Greek Literature (1453-1908)

After the capture of Constantinople, the destruction of Greek national life and the almost total effacement of Greek civilization naturally involved a more or less complete cessation of Greek literary production in the regions subjected to the rule of a barbarous conqueror. Learned Greeks found a refuge away from their native land; they spoke the languages of foreign people, and when they wrote books they often used those languages, in most cases they also wrote in Greek. The fall of Constantinople must not therefore be taken as indicating a break in the continuity of Greek literary history. Nor had that event so decisive an influence as has been supposed on the revival of learning in western Europe. The Crusades already had brought the Greeks to Western countries, and in the Levant had rendered the contact closer. Greeks and Latins had keenly discussed the dogmas which divided the Eastern and Western Churches; some Greeks had adopted the Latin faith or had endeavoured to reconcile the two communions, some had attained preferment in the Roman Church. Many had become connected by marriage or other ties with the Italian nobles who ruled in the Aegæan or the Aegean islands, and circumstances led them to settle in Italy. Of the writers who thus found their way to the West before the taking of Constantinople the most prominent were Leon or Leonios Pilatos, Georgius Gemistus, or Pletho, Manuel and John Chrysoloras, Theodore Gazes, George of Trebizond and Cardinal Bessarion.

The Ottoman conquest had reduced the Christian races in the plains to a condition of serfdom, but the spirit of liberty continued to breathe in the mountains, where groups of desperate men, the Klephts and the Haidukis, maintained the struggle against the alien tyrants. The adventurous and romantic life of these champions of freedom, spent amid the noblest solitude of nature and often tinged with the deepest tragedy, naturally produced a poetry of its own, fresh, spontaneous and entirely indigenous. The Klephtic ballads, all anonymous and composed in the language of the people, are unquestionably the best and most genuine Greek poetry of this epoch. They breathe the aroma of the forests and mountains; like the early rhapsodies of antiquity, which slipped off the tongues like a thousand forms, they lend a voice to the trees, the rocks, the rivers and to the mountains themselves, which sing the prowess of the Klepht, bewail his death and comfort his disconsolate wife or mother. Olympia boasts to Ossa that the footsteps of the Turk has never desecrated its valleys; the standard of freedom floats over its springs; there is a Klepht beneath every tree of its forests; an eagle sits on its summit with the head of a warrior in its talons. The dying Klepht bids his companions make him a large and lofty tomb that he may stand therein and load his musket: "Make a window in the side that the swallows may tell me that spring has come, that the nightingales may sing me the approach of flowery May." The wounded Vemum is addressed: "Rise, my master, let us go and find our comrades." "My bay horse! I cannot rise; I am dying; dig me a tomb with thy silver-shod hoof; take in thy teeth and lay me therein. Bear my arms to my companions and this handkerchief to my beloved, that she may see it and lament me." Another type of the popular poetry is presented by the folk-songs of the Aegean islanders and the maritime population of the Asiatic coast. In many of the former the influence of the Frankish conquest is apparent. Traces of the ancient mythology are often to be found in the popular songs. Death is commonly personified by Charon, who struggles with his victim; Charon is sometimes worsted, but as a rule he triumphs in the conflict.

In Crete, which for nearly two centuries after the fall of Constantinople remained under Venetian rule, a school of Greek poetry arose strongly impressed with Italian influences. The language employed is the dialect of the Candiotes, with its large admixture of Venetian words. The first product of this somewhat hybrid literature was Erotrctiles, an epic poem in five cantos, which relates the love story of Arete, daughter of Hercules, king of Athens, and Erotrctile, the son of his minister. The poem presents an interesting picture of Greece under the feudal Frankish princes, though professing to describe an episode of the classical epoch; notwithstanding some tedious passages, it possesses considerable merit and contains some charming scenes. The metre is the rhymed alexandrine. Of the author, Vicence Cornaro, who lived in the middle or end of the 16th century, little is known; he probably belonged to the ducal family of that name, from which Tasso was descended. The second poem is the Erotopile of George Chortakis, a Cretan, also written in the Candiote dialect. It is a tragic drama, the scene of which is laid in Egypt. The dialogue is poor, but there are some fine choral interludes, which perhaps are by a different hand. Chortakis, who was brought up at Retimo, lived at the end of the 16th and beginning of the 17th centuries. The third Cretan poem worthy of notice is the Shepherdess, a charming and graceful idyll written by Nicolas Drimyticos, a native of Apokorona, early in the 17th century. Other Cretan poets were J. Gregoropoulous and G. Mellasinos (1500), who wrote epigrams, and Maroulus (1493), who endeavoured to write Findalor odes.

Among the Greeks who were prominent in spreading a knowledge of Greek in Europe after the fall of Constantinople were John Argyropulos, Demetrius Chalcondyles, Constantine and John Lascaris and Marcus Musurus, a Cretan. These men wrote in the accepted literary language; in general, however, they were rather employed about literature than engaged in producing it. They taught Greek; several of them wrote Greek grammars; they transcribed and edited Greek classical writers, and they collected manuscripts. Their stores enriched the newly founded libraries of St Mark at Venice, of the Escorial, of the Vatican and of the National Library in Paris. But none of them accomplished much in literature strictly so called. The question which most deeply interested them was that of the rival merits of the Platonic and Aristotelian philosophies, over which a controversy of extraordinary bitterness broke out towards the close of the 15th century. The dispute was in reality theological rather than philosophical; the cause of Plato was championed by the advocates of a union between the Eastern and Western Churches, that of Aristotle was upheld by the opposing party, of whose fusion the Byzantine dramatic conceptions was revived. The patriarch, George Karthesios or Gennadius, whom Mahommed II. had appointed after the capture of

The Klephtic poetry.
Constantinople, wrote a treatise in favour of Aristotle and excommunicated Geomistus Pletho, the principal writer among the Platonists. On the other hand, George of Trebizond, who attacked Pletho with unmeasured virulence, was compelled to resign in post of secretary to Pope Nicholas V. and was imprisoned by Pope Paul I. Scholarship was not wholly extinct in Greece or among the Greeks for a considerable time after the Turkish conquest. Arsenius, who succeeded Musurus as bishop of Monemvasia (1510), wrote commentaries on Aristophanes and Euripides; his father, Apostoles, made a collection of Greek proverbs. Aemilius Portos, a Cretan, and Leo Allatios (1600–1650) of Chios edited a number of works of the classical and later periods with commentaries and translations; Allatios also wrote Greek verses showing skill and cleverness. Constantinople also produced during this period a Galatian, who composed verses on the return of that monarch to England. About the time of the fall of Constantinople we meet with some versifiers who wrote poems in the spoken dialect on historical subjects; among these were Papaspondylos Zotikos (1444), Georgias Limenitis (1450–1500) and Jacobos Trivoles (beginning of the 16th century); their poems have little merit, but are interesting as specimens of the popular language of the day and illustrating the manners and ideas of contemporary Greeks.

Among the prose writers of the 16th century were a number of chroniclers, the provosts, chiefly merchants of Imbros, who had been private secretary of Mahomed II., wrote the history of his master, Emmanuel Melaxos a history of the patriarchate, and Phranzes a history of the Palaeologoi. Theodosios Zygomalas (1580) wrote a history of Constantinople from 1391 to 1578. In the 17th century Demetrios Cantemir, a Moldavian by birth, wrote a history of the Ottoman empire, and G. Kontares tales of ancient Athens. Others composed chronicles of Cyprus and Crete, narratives of travels and biographies of saints. Most of these works are written in the literary language, the study of which was kept up in the various schools which it maintained at Constantinople and elsewhere. Various theological and philosophical works, grammars and dictionaries were written during this period, but elegant literature practically disappears.1

A literary revival followed in the 18th century, the precursor of the national uprising which resulted in the independence of Greece. The efforts of the great Phanariote families at Constantinople, the educational zeal of the higher Greek clergy and the munificence of wealthy Greeks like Michael Anagnostis of Rhodokanakes, who had acquired fortunes by commerce, combined to promote the spread of education among a people always eager for instruction. The Turks, indifferent to educational matters, failed to discern the significance of the movement. Schools were established in every important Greek town, and school-books and translations from Western languages issued from the presses of Venice, Triest, Vienna and other cities where the Greeks possessed colonies. Young men completed their studies in the Western universities and returned to the East as the missionaries of modern civilization. For the greater part of the 18th century the literature was mainly theological. Notable theological writers of this epoch were Elias Miniates, an elegant preacher, whose sermons are written in the popular language, and Mletois of Iannina, metropolitan of Athens, whose principal works were an ecclesiastical history, written in ancient Greek, and a descriptive geography of Greece in the modern language, composed, like the work of Pausanias, after a series of tours. The works of two distinguished prelates, both natives of Corfu and both ardent partisans of Russia, Nikephoros Theotokes (1731–1800) and Eugenios Bugis (1715–1806), mark the beginning of the national and literary renaissance. They wrote much in defence of Greek orthodoxy against Latin heresy. Theotokes, famous as a preacher, wrote, besides theological and controversial works, treatises on mathematics, geography and physics. Bulgares was a most prolific author; he wrote numerous translations and recensions of the Iliad and Odyssey of Homer, composed in verse for the return of that monarch to England. About the time of the fall of Constantinople we meet with some versifiers who wrote poems in the spoken dialect on historical subjects; among these were Papaspondylos Zotikos (1444), Georgias Limenitis (1450–1500) and Jacobos Trivoles (beginning of the 16th century); their poems have little merit, but are interesting as specimens of the popular language of the day and illustrating the manners and ideas of contemporary Greeks.

writers, written in Greek or French, he strove to awake the
terest of his countrymen in the past glories of their race or
administered to them sage counsels, at the same time addressing
ardent appeals to civilized Europe, and their behalf. The great
importance of Coraṣ, however, lies in the fact that he was
practically the founder of the modern literary language.

In contemporary Greek literature two distinct forms of the
modern language present themselves—the vernacular (ἡ καθομι
λογικὴ) and the purified (ἡ καθαρευοντα). The former is the oral
language, spoken by the whole Greek world, with local dialectic
variations; the latter is based on the Greek of the Hellenistic writers,
modified, but not essentially altered, in successive ages by the
popular speech. At the time of the War of Independence the
enthusiasm of the Greeks and the Philhellenes was fired by the
memory of an illustrious past, and at its close a classical reaction
followed: the ancient nomenclature was introduced in every
department of the new state, towns and districts received their
former names, and children were christened after Greek heroes
and philosophers instead of the Christian saints. In the literary
revival which attended the national movement, two schools of
writers made their appearance—the purists, who, rejecting
the spoken idiom as degenerate and corrupt, aimed at the
restored purity of "pure" Greek, who regarded the vernacular or "Romaic"
as the genuine and legitimate representative of the ancient
tongue. A controversy which had existed in former times was thus revived, with the
result that a state of confusion still prevails in the national
literature. The classical scholar who is as yet unacquainted with
modern Greek will find, in the pages of an ordinary periodical
or newspaper, specimens of the conventional literary language,
which he can read with ease side by side with poems or even
prose in the vernacular which will be altogether unable to
interpret.

The vernacular or oral language is never taught, but is universal-
ly spoken. It has been evolved from the ancient language by
a natural and regular process, similar to that which
has produced the Romance languages from the Latin,
or the Russian, Bulgarian and Servian from the
old Slavonic. It has developed on parallel lines with
the modern European languages, and in obedience to the same
laws; like them, it might have grown into a literary language
had any great writers arisen in the middle ages to do for it what
Dante and his successors did for Italian, and what
the effort to adapt it to the requirements of modern literature
could hardly prove successful. In the first place, the national
sentiment of the Greeks prompts them to imitate the classical
writers, and so far as possible to appropriate their diction.
The beauty and dignity of the ancient tongue possesses such an
attraction for cultivated writers that they are led insensibly to
adopt its forms and borrow from its wealth of phrase and idiom.
In the next place, a certain literary tradition and usage has
already been formed which cannot easily be broken down. For
more than half a century the generally accepted written language
half modern half ancient, has been in use in the schools, the
university, the parliament, the state departments and the
pulpit, and its influence upon the speech of the more educated
classes is already noticeable. It largely owes its present form—
though a fixed standard is still lacking—to the influence and
teaching of Coraṣ. As in the time of the decadence a κοινὴ
dιάλεκτος stood midway between the classical language and the
popular speech, so at the beginning of the 19th century there
existed a common literary dialect, largely influenced by the
vernacular, but retaining the characteristics of the old literary
language, from which it was derived by an unbroken literary tradition.
This written language Coraṣ took as the basis of his reforms,
purging it of foreign elements, preserving its classical remnants
and enlarging its vocabulary with words borrowed from the
ancient lexicon or, in case of need, invented in accordance with
a fixed principle. He thus adopted a middle course, disconten-
tancing alike the pedantry of the purists and the over-confident
optimism of the vulgarists, who found in the uncouth popular
speech all the material for a langue savante. The language
which he thus endeavoured to shape and reconstruct is, of
course, conventional and artificial. In course of time it will
probably tend to approach the vernacular, while the latter
will gradually be modified by the spread of education. The
spoken and written languages, however, will always be separated
by a wide interval.

Many of the best poets of modern Greece have written in the
vernacular, which is best adapted for the natural and spontaneous
expression of the feelings. Dionysios Solomos (1798-
1857), the greatest of them all, employed the dialect
of the Ionian Islands. Of his lyrics, which are full of
poetic fire and inspiration, the most celebrated is his
Drama in the Servian language.

Poetical writers in the Servian language.

With the emancipation of Greece, and the mountainous district of Epirus. This dialect had at least the
advantage of being generally current throughout the mainland,
while it derived distinction from the heroic exploits of the
champions of Greek liberty. The poems of Valaorites, which are characterized by vivid imagination and grace of style, have
made a deep impression on the nation. Other poets who largely
employed the Epirotic dialect and drew their inspiration
from the Kephthic songs were John Viliras (1771-1823), George
Zalokostas (1805-1837) in his lyric pieces, and Theodore Aphen-
toules, a Cretan (d. 1893). With the poems of this group may
be classed those of Demetrius Bikelas (b. 1835). The popular
language has been generally adopted by the younger generation
of poets, among whom may be mentioned Aristomenes Polychroni-
gios (1850), George Bizyonas (1853-1896), George Drosis,
John Polémis, Kostas Palamas (b. 1859), John Polémis, Argyes Ephthialites, and
Jacob Polylas (d. 1860).

Contemporary with the first-mentioned or Ionic group, there
exist at Constantinople a school of poets who wrote in the
accepted literary language, and whose writings serve
as models for the later group which gathered at Athens
after the emancipation of Greece. The literary traditions founded by Basiliades Rizos Efthaxides
(1810-1852) and the brothers Alexander and Panagiotis
Soutzos (1803-1863 and 1800-1868), who belonged
to Phanariot families, were maintained in Athens by Spiridon
Basilides (1843-1874) and Angelos Vlagos (b. 1838), John Kara-
soutzos (1824-1873), Demetrios Paparrhegopoulos (1843-1873),
and Achilles Paraschos (b. 1838). The last, a poet of fine feeling,
has also employed the popular language. In general the practice
of versification in the conventional literary language has declined,
though sedulously encouraged by the university of Athens,
and fostered by annual poetic competitions with the prizes provided
by patriotic citizens. Greek lyric poetry during the first half of
the century was mainly inspired by the patriotic sentiment
aroused by the struggle for independence, but in the present
generation it often shows a tendency towards the philosophic
and contemplative mood under the influence of Western models.

There has been an abundant production of dramatic literature
in recent years. In succession to Alexander Rangabê, John
Zampelios and the two Soutzos, who belong to the
past generation, Kleon Rangabê, Angelos Vlagos,
and the two Soutzos Koromais, who have been
the most prominent among modern dramatic
writers. Numerous translations of foreign master-
pieces have appeared, among which the metrical versions
of Romeo and Juliet, Othello, King Lear, Hamlet, Macbeth and The
Merchant of Venice, by Demetrios Bikelas, deserve mention
as examples of artistic excellence. Goethe's Faust has been
rendered into verse by Probelagos, and Hamlet, Antony
and Cleopatra, Coriolanus and Julius Caesar, into prose by Damiroles.

Poetical writers in the Servian language.
Among recent satirists, George Souris (b. 1853) occupies a unique position. He reviews social and political events in the "Pamflos, a witty little newspaper written entirely in verse, which is read with delight by all classes of the population.

Almost all the prose writers have employed the literary language. In historical research the Greeks continue to display much activity and erudition, but no great work comparable to Spiridon Trivopoulos' History of the Ionian Islands is in preparation. In archaeology, the excavations of Bikelas at Miletos, the excavation of the Greek cemetery at Cretas, N. S., Greece, (J. Polites, Fauriel, the "Piros" (v. 1., Paris, 1880); Kontos, Dines katharof (Athens, 1882); Rangabah and Sanders, Geschichte der neugriechischen Literatur von ihren Anfängen bis auf die neueste Zeit (Leipzig, 1885); and the Jena, 1885; etudes de philologie neo-grecque (Paris, 1892); B. Blasi, Die Aussprache des Griechischen (3rd ed., Berlin, 1888); Papademetropoulos, Vatikanische Sprachproben (Athens, 1892); the Appendix in the "Cyprus" (London, 1892); Rhoides, Τα Επίσκεψη. Παλαιοκατεχατο (Athens, 1893); Politis, Μελέτη του ελληνικού λαού (2 vols., Athens, 1895), have been published. The Kleokrates' ballads and folk-songs: C. Fauriel, Chants populaires de la Grèce moderne (Paris, 1824, 1826); Passow, Popula- 

rigorous, George Hatidze, Theodore Papademetropoulos, and John Pschirri; in archaeology, Stephen Kovaonoudes, Panagiotis Kavvadias and Christos Tsountas have won a recognized position among scholars. John Svoronos is a high authority on numismatics. The works of John Hatidze in mathematics, Anat. Christomanos on chemistry, and Demetrios Aigeon in astronomy are well known.

The earlier writers of fiction, written in the period preceding the emancipation of Greece, were much affected by foreign influence. Modern Greece has not produced any great novelist. The Κρητικό γλώσσα of Spiridon Ameplious, the scene of which is laid in Crete, and the Θάνες Βλέχας of Kalligas are interesting, the former for its accuracy of historical detail, the latter as a picture of peasant life in the mountains of Greece. Original novel writing has not been much cultivated, but translations of foreign romances abound. In later times the story has come into vogue through the example of D. Bikelas, whose tales have acquired great popularity; one is "La Μαγιά" which has been translated into many languages. The example of Bikelas has been followed by Drosines Karkavitzis, Ephraimitis, Xenoopoulos and many others.

The most distinguished of the writers who adhere to the vernacular in prose is John Pschirri, professor of the École des Hautes Études in Paris. He is the recognized leader of the vulgarists. Among the best known of his works are Τα Ραξάκι μου, a narrative of a journey in Greek lands, Τάξημα τού Πανόρμου, Πανόρμου, and Το Μετά. The tales of Karkavitzis and Ephraimitis are also in the vernacular. Among the younger of Pschirri's followers is M. Palli, who has recently published a translation of the Iliad. Owing to the limited resources of the popular language, the writers of this school are sometimes compelled to employ strange and little-known words borrowed from the various dialects. The vernacular has never been adopted by writers on scientific subjects, owing to its inherent unsuitability and the incongruity arising from the introduction of technical terms derived from the ancient language. Notwithstanding the zeal of its adherents, it seems unlikely to maintain its place in literature outside the domain of poetry; nor can any other result be expected, unless its advocates succeed in reforming the system of public instruction in Greece.

Many periodicals are published at Athens, among which may be mentioned the Athenia, edited by Konstantin Kontos, the Ethnikē Agoge, a continuation of the old Ηστία, the Harmonia and the Διάλεκτα τού παλιού, an educational review. The Parnassos, the Archaeological Society and other learned bodies issue annual or quarterly reports. The Greek journals are both numerous and widely read. They contain much clever writing, which is often marred by inaccuracy in a definition of a fact or a date. The tendency to exaggerated patriotic sentiment sometimes borders on the ludicrous. For many years the Νέα Ήμερα of Trieste exerted a considerable influence over the Greek world, owing to the ability of its editors, Anastasios Byzantios (d. 1898), a publicist of remarkable insight and judgment.

GREEK RELIGION.

The recent development of anthropological science and of the comparative study of religions has enabled us at last to assign to ancient Greek religion its proper place in the classification of creeds and to appreciate its importance for the history of civilization. In spite of all the diversities of nature, and even of the forms which we may give to a general definition of the theological system of the Hellenic communities, and with sufficient accuracy may describe it as an anthropomorphic polytheism, preserving many traces of a pre-anthropomorphic period, unchecked by any dogma or tradition of revelation, and therefore pliantly adapting itself to all the changing circumstance of the social and political history of the race, and easily able to assimilate alien ideas and forms. Such a religion, continuing in whole or in part throughout a period of at least 2000 years, was more capable of progress than others, possibly higher, that have arisen in antiquity, and which were formed as, owing to its essential character, it could not be convulsed by any inner revelation that might obliterate the deposits of its earlier life; it was likely to preserve the imprints of the successive ages of culture, and to reveal more clearly than any other testimony the evolution of the race from savagery to civilization.

Hence it is that Greek religion appears to teem with incongruities, the highest forms of religious life being often confronted with the most primitive. And for this reason the student of savage
anthropology and the student of the higher religions of the world are equally rewarded by its study.

Modern ethnology has arrived at the conviction that the Hellenic nation, like others that have played great parts in history, was the product of a blend of populations, the conquering tribes of Aryan descent coming from the north and settling among and upon certain pre-Hellenic Mediterranean stocks. The conclusion that is naturally drawn from this is that Hellenic religion is also the product of a blend of early Aryan or Indo-Germanic beliefs with the cult-ideas and practices of the Mediterranean area that were from of old indigenous in the lands which the later invaders conquered. But to disentangle these two component parts of the whole, which might seem to be the first problem for the history of the development of this religion, is by no means an easy task; we may advance further towards its solution, when the mysterious pre-Hellenic Mediterranean language or group of languages, of which traces remain in Hellenic place-names, and which may be lying uninterpreted on the brick-tablets of the palace of Cnossus, has been found.

The first question is naturally one of language. But the comparative study of the Indo-European speech-group, great as its philological triumphs have been, has been meagre in its contributions to our positive knowledge of the original belief of the primitive stock. It is not possible to reconstruct a common Indo-European religion. The greater part of the separate Aryan cult-systems may have developed after the diffusion and may have been the result of contact in prehistoric days with non-Aryan peoples. And many old religious etymological equations, such as Oinós-Sanskrit Varuna, Kouchér-Saraméysa, Athena = Ahana, were uncritically made and have been abandoned. The chief fact that philology has revealed concerning the religious vocabulary of the Aryan peoples is that many of them are found to have designated a high god by a word derived from a root meaning "bright," and which appears in Zeus, Jupiter, Sanskrit Dyáus. This is important enough, but we should not exaggerate its importance, nor draw the unwarranted inference that therefore the primitive Indo-Europeans worshipped one supreme God, the Sky-Father. Besides the word "Zeus," the only other names of the Hellenic pantheon that can be explained wholly or partly as words of Aryan formation are Poseídon, Demeter, Hestia, Dionysús (whose name and cult were derived from the Aryan stock of the Thraco-Phrygians) and probably Pan. But other names, such as Athena, Ares, Apollo, Artemis, Hera, Hermes, have no discovered affinities with other Aryan speech-groups; and yet there is nothing suspiciously non-Aryan in the formation of these words, and they may all have belonged to the earliest Hellenic-Aryan vocabulary. In regard to others, such as Rhea, Hestia, Hecate, it is much more probable that they belonged to an older pre-Hellenic stock that survived in Crete and other islands, and here and there on the mainland; while we know that Zeus derived certain unintelligible titles in Cretan cult from the indigenous Eteo-Cretan speech.

A minute consideration of a large mass of evidence justifies the conclusion that the main tribes of the Aryan Hellenes, pushing down from the north, already possessed certain deities in common such as Zeus, Poseidon and Apollo with whom they associated certain goddesses, and that they maintained the cult of Hestia or "Holy Hearth." Further, a comparison of the developed religions of the respective Aryan peoples suggests that they tended to give predominance to the male divinity, although we have equally good reason to assert that the cult of goddesses, and especially of the earth-goddess, is a genuinely "Aryan" product. But when the tribes of this family poured into the Greek peninsula, it is probable that they would find in certain centres of a very ancient civilization, such as Argolis and Crete, the dominant cult of a female divinity. 1 The recent excavations on the site of the Hera temple at Argos prove that a powerful goddess was worshipped here many centuries before it is probable that the Hellenic invader appeared. He may have even found the name Hera there, or may have brought it with him and applied it to the indigenous divinity. Again, we are certain that the great mother-goddess of Crete, discovered by Dr Arthur Evans, is the ancestress of Rhea and of the Greek "Mother of the gods," and it is a reasonable conjecture that she accounts for many of the forms of Artemis and perhaps for Athena. But the evidence by no means warrants us in assuming as an axiom that wherever we find a dominant goddess-cult, as that of Demeter at Eleusis, we are confronted with a non-Hellenic religious phenomenon. The very name "Demeter" and the study of other Aryan religions prove the prominence of the worship of the earth-goddess in our own family of the nations. Finally, we must reckon with the possibility that the other great nations which fringed the Mediterranean, Hittite, Egyptian and Egyptian peoples, left their impress on early Greek religion, although former scholars may have made rash use of this hypothesis. 2

Recognizing then the great perplexity of these problems concerning the ethnic origins of Hellenic religion, we may at least reduce the tangle of facts to some order by distinguishing its lower from its higher forms, and thus provide the material for some theory of evolution. We may collect and sift the phenomena that remain over from a pre-anthropomorphic period, the imprints of a savage past, the beliefs and practices that belong to the animistic or even the superstitious level, as the study of both the primitive peoples of Greece and Crete, and the study of the primitive population of the Mediterranean, have shown, has proved impossible. The shall at once be struck with the contrast between such civilized cults as those of Zeus, Athena, Apollo, high personal divinities to whom the attributes of a progressive morality could be attached, and practices that long survived in backward communities, such as the Arcadian worship of the thunder and the winds, the cult of Zeus Károvoi the thunder "at Mantinea and Zeus Karróoras in Laconia, who is none other than the mysterious meteoric stone that falls from heaven. These are examples of a religious view in which certain natural phenomena or objects are regarded as mysteriously divine or sacred in their own right and a personal divinity has not yet emerged or been separated from them. An noteworthy product of primitive animistic feeling is the universally prevalent cult of Hestia, who is originally "Holy Hearth" pure and simple, and who even under the developed polytheism, in which she played no small part, was never established as a separate anthropomorphic personage.

The animistic belief that certain material objects can be charged with a divine potency or spirit gives rise to fetishism, and it is easy to see why it is much more probable than they belonged to an older pre-Hellenic stock that survived in Crete and other islands, and here and there on the mainland; while we know that Zeus derived certain unintelligible titles in Cretan cult from the indigenous Eteo-Cretan speech.

1 This has often been explained as a result of Muttererchi, or reckoning descent through the female; for reasons against this hypothesis see Rother's "Die Archäologie der vergleichenden Religionsgeschichte" (1904); cf. A. J. Evans, "Mycenaean Tree and Pillar Cult," in Journ. of Hellenic Studies (1901).

2 V. Béard has recently revived the discredited theory of a prevalent Phoenician influence in his ingenious but uncritical work, L'Origine des cultes arcadiens. M. P. Foucart believes in very early borrowing from Egypt, as explaining much in the religion of Demeter and Dionysus; see Les Grands Mystères d'Eleusis and Le Culte de Dionysos en Attique.
Finally, among the primitive or savage phenomena the practice of human sacrifice looms large. Encouraged at one time by the Delphic oracle, it was becoming rare and repellent to the conscience by the 6th century B.C.; but it was not wholly extinct in the Greek world even by the time of Porphyry. The facts are very complex and need critical handling, and a satisfying scientific explanation of them all is still to come.

We can now observe the higher aspects of the advanced polytheism. And at the outset we must distinguish between mythology and religion strictly understood, between the stories about the deities and the private or public religious service. No doubt the former are often a reflection of the latter, in many cases being suggested by the ritual which may have been invented to interpret, and often envisaging important cult-ideas. Such for example are the myths about the purification and trial of Orestes, Theseus, Ixion, the story of Demeter's sorrow, of the sufferings and triumph of Dionysus, and those about the abolution of human sacrifice. Yet Greek mythology as a whole was irresponsible, without reserve, and unchecked by dogma or sacerdotal prohibition; and frequently it sank below the level of the current religion, which was almost free from the impurities which shock the modern reader of Hellenic myths. Nor again did any one feel himself called upon to believe any particular myth; in fact, faith, understood in the sense in which the term is used in Christian theology, as the will to believe certain dogmatic statements about the nature and action of divinity, was not the aspiration of the Hellenes. It was neither established as inevitable in the ethics or religious doctrine; only, if a man proclaimed his disbelief in the existence of the gods and refused to join in the ritual of the community, he would become "suspect," and might at times be persecuted by his fellows. Greek religion was not so much an affair of doctrine as of ritual, religious formulae of which the cult-titles of the deities were an important component, and prayer; and the most illuminative sources of our knowledge of it are the ritual-inscriptions and other state-documents, the private dedications, the monuments of religion art and certain passages in the literature, philology and archaeology being equally necessary to the equipment of the student.

We are tempted to turn to Homer as the earliest authority. And though Homer is not primitive and does not present even an approximately complete account of Greek religion, we can gather from his poems a picture of an advanced polytheism which in form and structure at least is that which was presented to the world of Aeschylus.

We discern a pantheon already to some extent systematized, a certain hierarchy and family of deities in which the god of war, Zeus, was always at the top, and the anthropomorphic impulse, the strongest trend in the Greek religious imagination, which filled the later world with fictitious personages, generating transparent shams such as an Ampdromus for the ritual of the Ampdromia, Amphiction for the Amphictiones, a hero Cepagos for the gird of potters, is already at its height in the Homeric poems. The deities are already clear-cut, individual personalities of distinct ethos, plasticly shaped figures such as the later sculpture and painting could work upon, not vaguely conceived numina like the forms of the later religion. Nor can we call them for the most part nature-deities like the personages of the Vedic system, thinly disguised "personifications" of natural phenomena. Athena is not the blue sky nor Apollo the sun; they are simply Athena and Apollo, divine personages with certain powers and character, as real for their people as Christ and the Virgin for Christendom. By the side of these, though generally in a subordinate position, we find that Homer recognized certain deities that we may properly call nature-powers, such as Helios, Gaia and the river-deities, forms descending probably from a remote animistic period, but maintaining themselves within the popular religion till the end of Paganism. Again, though Homer may talk and think at times with levity and banalité about his deities, his deeper utterances impune an advanced morality to the supreme
Greek Religion

God. His Zeus is on the whole a power of righteousness, dealing with men by a righteous law of nemesis, never being himself the author of evil—an idea revealed in the opening passage of the Odyssey—but protecting the good and punishing the wicked. Vengeance, indeed, was one of the attributes of divinity both for Homer and the average Greek of the later period, as it is in Judaic and Christian theology, though Plato and Euripides protested strongly against such a view. But the Homeric Zeus is equally a god of pity and mercy, and the man who neglects the prayers of the sorrowful and afflicted, who violates the sanctity of the supplicant and guest, or oppresses the poor or the wanderer, may look for divine punishment. Though not regarded as the physical author of the universe or the Creator, he is in a moral sense the father of gods and men. And though the sense of sin and the need of piacular sacrifices are expressed in the Homeric poems, the relations between gods and men that they reveal are on the whole genial and social; the deity sits unseen at the good man's festal sacrifice, and there is a simple apprehension of the idea of divine communion. There is also indeed a glimmering of the dark background of the nether world, and the chthonian powers that might send up the Erinyes to fulfill the curse of the wronged. Yet on the whole the religious atmosphere is generally cheerful and bright; freer than that of the later ages from the taint of magic and superstition; nor is Homer troubled much about the life after death; he scarcely records the fate of the dead,1 and is not oppressed by fears of the ghost-world.

If we look now broadly over the salient facts of the Greek public and private worship of the historic period we find much in it that agrees with Homeric theology. His "Olympian" system retains a certain life almost to the end of Paganism, and it is a serious mistake to suppose that it had lost its hold upon the people of the 5th and 4th century B.C. We find it, indeed, enriched in the post-Homeric period with new figures of prestige and power; but Homer, as much as any other writer of the most ancient times,Candidate for the high god with a worship full of promise for the future. Demeter and Kore, the mother and the girl, whom Homer knew well enough but could not use for his epic purposes, attract the ardent affections and hopes of the people; and Asclepius, whom the old poet did not recognize as a god, wins a conspicuous place in the later shrines. But much that has been said of the Homeric may be said of the later classical theology. The deities remain anthropomorphic, and appear as clearly defined individuals. A certain hierarchy is recognized; Zeus is supreme, even in the city of Athens, but each of the higher divinities played in many parts, and local enthusiasm could frustrate the departmental system of divine functions; certain members of the pantheon had a preference for the life of the fields, but as the polis emerged from the village communities, Demeter, Hermes, Artemis and others, the gods and goddesses of the husbandman and shepherds, become powers of the council-chamber and the market-place. The moral ideas that we find in the Homeric religion are amply attested by cult-records of the later period. The deities are regarded on the whole as beneficent, though revengeful if wronged or neglected; the cult-titles used in prayer, which more than any other witnesses reveal the thought and wish of the worshipper, are nearly always euphemistic, the doubtful title of Demeter Erinyes being possibly an exception. The important cults of Zeus Ιδέατος and Ποσιστράθαρας, the suppliant's protecting deity, embody the ideas of pity and mercy that mark advanced religion; and many momentous steps in the development of morality and law were either suggested or assisted by the state-religion. For example, the sanctity of the oath, the main source of the secular virtue of truthfulness, was originally a religious sanction, and though the Greek may have been prone to perjury, yet the Hellenic like the Hebraic religious ethics regarded it as a heinous sin. The sanctity of

1 This became very powerful from the 7th century onward, and there are traces of a corresponding institution in the pit or so-called Mycenaean period; vide Rohde's Psyche (new edition), Tsountas and Manatt, The Mycenaean Age.

family duties, the sacredness of the life of the kinsmen, were ideas fostered by early Hellenic religion before they generated the principles of secular ethics. In the post-Homeric period, the development of the doctrine of purity, which was associated with the Apolline religion, combining with a growing dread of evil, resulted in the gradual generalization and individuality of the spirit always the evolution of the Greek law concerning homicide.2 And the beginnings of international law and morality were rooted in religious sanctions and taboo. In fact, Greek state-life was indebted in manifold ways to Greek religion, and the study of the Greek oracles would alone supply sufficient testimony of this. In many cases the very origin of the state was religious, the earliest poleis sometimes having arisen under the shadow of the temple.

Yet a Greek religion was always in the service of the state, and the priest a state-official, society was the reverse of theocratic. Secular advance, moral progress and the march of science, could never long be thwarted by religious tradition; on the contrary, speculative thought and artistic creation were considered as attributes of divinity. We may say that the religion of Hellas penetrated the whole life of the people, but rather as a servant than as a master.

Distinct and apart from these public worship and those of the clan and family were the mystic cults of Eleusis, Andania and Samothrace, and the private services of the mystic brotherhoods. The Hellenic development in the later period has been stimulated, their significance intensified by the wave of mysticism that spread at first from the north, from the beginning of the 7th century onwards, and derived its strength from the power of Dionysus and the Orphic brotherhoods. New ideals and hopes began to stir in the religious consciousness, and we find a strong salvationist tendency, the promise of salvation relying on mystic communion with the deity. Also a new and vital principle is at work; Orphism is the only force in Greek religion of a clear apostolic purpose, for it broke the barriers of the old tribal and civic cults, and preached its message to bond and free, Hellene and barbarian.

The later history of Greek paganism is mainly concerned with its gradual penetration by Oriental ideas and worship, and the results of this θεοκρατία are discerned in an ever increasing mysticism and a tendency towards monothelmoty. Obliterated as the old Hellenic religion appeared to be by Christianity, it nevertheless retained a certain life, though transformed, under the new creed to which it lent much of its hierarchic organization and religious terminology. The indebtedness of Christianity to Hellenism is one of the most interesting problems of comparative religions, and for an adequate estimate a minute knowledge of the ritual and the mystic cults of Hellas is one of the essential conditions.

Farnell, Evolution of Religion (Hibbert Lectures, 1905), pp. 139—152.
GREELEY, HORACE (1811-1872), American statesman and man of letters, was born at Amherst, New Hampshire, on the 3rd of February 1811. His parents were of Scotch-Irish descent, but the ancestors of both had been upon New England for several generations. He was the third of seven children. His father, Zaccheus Greeley, owned a farm of 50 acres of stony, sterile land, from which a bare support was wrung. Horace was a feeble and precocious lad, taking little interest in the ordinary sports of childhood, learning to read before he was able to talk plainly, and the prodigy of the neighbourhood for accurate spelling. Before Horace was ten years old (1829), his father became bankrupt, his home was sold by the sheriff, and Zaccheus Greeley himself fled the town to escape arrest for debt. The family removed to West Haven, Vermont, where, all working together, they made a scanty living as day labourers. Horace from childhood desired to be a printer, and, when barely eleven years old, tried to be taken as an apprentice in an office at Whitehall, New York, but was rejected on account of his youth. After three years more with the family as a day labourer at West Haven, he succeeded, with his father's consent, in being apprenticed in the office of The Northern Spectator, at East Poultney, Vermont. Here he soon became a good workman, developed a passion for politics and especially for Whig politics, started a little periodical, and succeeded more or less of the editing of the paper, and was a figure in the village debating society. He received only $40 a year, but he spent most of his money to his father. In June 1830 The Northern Spectator was suspended. Meantime his father had removed to a small tract of wild land in the dense forests of Western Pennsylvania, 30 m. from Erie. The released apprentice now visited his parents, and worked for a little time with them on the farm, meanwhile seeking employment in various printing offices, and, when he got it, giving nearly all his earnings to his father. At last, with no further prospect of work nearer home, he started for New York. He travelled on foot and by canal-boat, entering New York in August 1831, with all his clothes in a bundle carried over his back with a stick, and with but $10 in his pocket. More than half of this sum was exhausted while he made vain efforts to find employment. Many refused to employ him, in the belief that he was a runaway apprentice, and his poor, ill-fitting apparel and rustic look were everywhere greatly against him. At last he found work on a 32mo New Testament, set in agate, double columns, with a middle column of notes in parallel with the text, and sold at 25 cents. He made $1.25 and sold all the stock he had abandoned it. He barely succeeded in making enough to pay his board bill, but he finished the task, and thus found subsequent employment easier to get.

In January 1833 Greeley formed a partnership with Francis V. Story, a fellow-workman. Their combined capital amounted to about $150. Procuring their type on credit, they opened a small office, and undertook the printing of the Morning Post, the first cheap paper published in New York. Its projector, Dr Horatio D. Shepard, meant to sell it for one cent, but under the arguments of Greeley he was persuaded to fix the price at two cents. The paper failed in less than three weeks, the printers losing only $50 or $60 by the experiment. They still had a Bank Note Reporter to print, and soon got the printing of a tri-weekly paper, the Constitutionalist, the organ of some lottery dealers. Within six months Story was drowned, but his brother-in-law, Jonas Winchester, took his place in the firm. Greeley was now asked by James Gordon Bennett to go into partnership with him in starting The Herald. He declined the venture, but recommended the partner whom Bennett subsequently took. On the 2nd of March 1834, Greeley and Winchester issued the first number of The New Yorker, a weekly literary and news paper, the firm then supposing itself to be worth about $3000. Of the first number they sold about 100 copies; of the second, nearly 200. There was an average increase for the next month of about 100 copies per week. The second volume began with a circulation of about 4550 copies, and with a loss on the first year's publication of $8000. The second year ended with 7000 subscribers and a further loss of $2000. By the end of the third year The New Yorker had reached a circulation of 9500 copies, and had sustained a total loss of $7000. It was published seven years (until the death of September 1841), and was never profitable, but it was widely popular, and it gave Greeley, who was its sole editor, much prominence. On the 5th of July 1836 Greeley married Miss Mary Y. Cheney, a Connecticut school teacher, whom he had met in a Grahamite (vegetarian) boarding-house in New York.

During the publication of The New Yorker he added to the scanty income which the job printing brought him by supplying editorials to the short-lived Daily Whig and various other publications. In 1838 he had gained such standing as a writer that he was selected by Thurlow Weed, William H. Seward, and other Whig leaders to edit the Whig paper The New Yorker. Its campaign paper, entitled The Jeffersonian, published at Albany. He continued The New Yorker, and travelled between Albany and New York each week to edit the two papers. The Jeffersonian was a quiet and instructive rather than a vehement campaign sheet, and the Whigs believed that it had a great effect upon the elections of the next year. When, on the 2nd of May 1840, some time after the nomination by the Whig party of William Henry Harrison for the Presidency, Greeley began the publication of a new weekly campaign paper, The Log Cabin, it sprang at once into a great political success, and was sold at 40 cents a copy. In a year it had run a circulation of 60,000, and by the seventh reached 11,000, which was then the full capacity of its press. It was alert, cheerful and aggressive, was greatly helped by the attacks of rival papers, and promised success almost from the start.

From this time Greeley was popularly identified with The Tribune, and its share in the public discussion of the time is his history. It soon became moderately prosperous, and its assured income should have placed him beyond pecuniary worry. His income was long above $15,000 per year, frequently as much as $30,000. From the first it cared nothing for money, and subordinates to his political aims. He was not disposed to endorse for his friends, and was often unable to distinguish between deserving applicants for aid and adventurers. He was thus frequently straitened, and, as his necessities pressed, he sold successive interests in his newspaper. At the outset he owned the whole of it. When it was already firmly established (in July 1841), he took in Thomas McElrath as an equal partner, upon the contribution of $2000 to the common fund. By the 1st of January 1849 he had reduced his interest to 315 shares out of 100; by July 2nd, 1866, to 15 shares; in 1868 he owned only 9; and in 1872, only 6. In 1867 the stock sold for $6500 per share, and his last sale was for $6000. He brought wild lands, took stock in mining companies, desicated egg companies, patent looms, photo-lithographic companies, gave away profusely, lent to plausible rascals, and was the ready prey of every new inventor who chanced to find him with money or with property that he could readily convert into money.

In September 1841 Greeley merged his weekly papers, The Log Cabin and The New Yorker, into The Weekly Tribune, which soon attained as wide circulation as its predecessors, and was much more profitable. It rose in a time of great political excitement to a total circulation of a quarter of a million, and it sometimes had for successive years 140,000 to 150,000. For several years it was rarely much below 100,000. Its subscribers were found throughout all quarters of the northern half of the Union from Maine to Oregon, large packages going to remote districts beyond the Mississippi or Missouri, whose only connection with the outside world was through a weekly or semi-weekly mail. The readers of this weekly paper acquired a personal affection for
GREELEY, HORACE

its editor, and he was thus for many years the American writer most widely known and most popular among the rural classes. The circulation of The Daily Tribune was never proportionately great—less led to it by those of a protective tariff, prohibitory liquor legislation and other peculiarities, repelling a large support which it might otherwise have commanded in New York. It rose within a short time after its establishment to a circulation of 20,000, reached 50,000 and 60,000 during the Civil War, and thereafter ranged at from 30,000 to 45,000. After May 1845 a semi-weekly edition was also printed, which ultimately reached a steady circulation of from 15,000 to 25,000.

From the outset it was a cardinal principle with Greeley to help all sides, and to extend a special hospitality to new ideas. In May 1842 The Tribune began to give one column daily to a discussion of the doctrines of Charles Fourier, contributed by Albert Brisbane. Gradually Greeley came to advocate some of these doctrines editorially. In 1846 he had a sharp discussion upon them with a former subordinate, Henry J. Raymond, then employed upon a rival journal. It continued through twelve articles on each side, and was subsequently published in book form. Greeley became personally interested in one of the Fourierite associations, the North American Phalanx, at Red Bank, N. J. (1843–1855), which doubtless led to his encouragement to other socialistic experiments, such as that at Brook Farm. When this was abandoned, its leader George Ripley, with one or two other members, sought employment from Greeley upon The Tribune. Greeley dissented from many of Fourier's propositions, and in later years was careful to explain that the principle of association for the common good of working men and the elevation of labour was the chief feature which attracted him. Co-operation among working men he continued to urge throughout his life. In 1850 the Fox Sisters, on his wife's invitation, spent several weeks in his house. His attitude towards their "rappings" and "spiritual manifestations" was one of observation and inquiry; and in his Recollections he wrote concerning these manifestations: "That some of them are the result of juggle, collusion or trick I am confident; that others are not, I decidedly believe."

From boyhood he had believed in a protective tariff, and throughout his active life he was its most trenchant advocate and propagandist. Besides constantly urging it in the columns of The Tribune, he appeared as early as 1843 in a public debate on "The Grounds of Protection," with Samuel J. Tilden and Parke Godwin as his opponents. Two of his principal essays on the subject were published over his own signature in The Tribune in 1860, and subsequently republished in book form, with a title-page describing protection to home industry as a system of national co-operation for the elevation of labour. He opposed woman suffrage on the ground that the majority of women did not want it and never would, and declared that until woman should "emancipate herself from the thraldom to etiquette," she "could not see how the woman's rights theory " is ever to be anything more than a logically defensible abstraction." He aided practical efforts, however, for extending the sphere of woman's employments. He opposed the theatres, and for a time refused to publish their advertisements. He held the most rigid views on the sanctity of marriage and against easy divorce, and vehemently defended them in controversies with Robert Dale Owen and others. He practised and pertinaciously advocated total abstinence from spirituous liquors, but did not regard prohibitory laws as always wise. He denounced the repudiation of state debts or the failure to pay interest on them. He was zealous for Irish repeal, once held a place in the "Directory of the Friends of Ireland," and contributed liberally to its support. He used the occasion of Charles Dickens's first visit to America to urge international copyright, and was one of the few editors to avoid alike the flunkeyism with which Dickens was first received, and the ferocity with which he was assailed after the publication of his American Notes. On the occasion of Dickens's second visit to America, Greeley presided at the great banquet given him by the press of the country. He made the first elaborate reports of popular scientific lectures by Louis Agassiz and other authorities. He gave ample hearing to the advocates of phonography and of phonographic spelling. He was one of the most conspicuous advocates of the Pacific railroads, and of many other internal improvements.

But it is as an anti-slavery leader, and as perhaps the chief agency in educating the mass of the Northern people to that opposition through legal forms to the extension of slavery which culminated in the election of Abraham Lincoln and the Civil War, that Greeley's main work was done. Incidents in it were his vehement opposition to the Mexican War as a scheme for more slavery territory, the assault made upon him in Washing- ton by Congressmen Albert Rust of Arkansas in 1856, an indictment in Virginia in the same year for circulating incendiary documents, perpetual denunciation of him in Southern newspapers and speeches, and the hostility of the Abolitionists, who regarded his course as too conservative. His anti-slavery work culminated in his appeal to President Lincoln, entitled "The Prayer of Twenty Millions," in which he urged "that all attempts to put down the rebellion and at the same time uphold its inciting cause" were preposterous and futile, and that "every hour of deference to slavery" was "an hour of added and unfilled peril." President Lincoln in his reply said: "My paramount object is to save the Union, and not either to save or destroy slavery..... What I do about slavery and the coloured race, I do because I believe it helps to save this Union; and what I forbear, I forbear because I do not believe it would help to save the Union... I have here stated my purpose according to my views of official duty; and I intend no modification of my oft-expressed personal wish that all men everywhere could be free." Precisely one month after the date of this reply the Emancipation Proclamation was issued.

Greeley's political activity, first as a Whig, and then as one of the founders of the Republican party, was incessant; but he held few offices. In 1848–1849 he served a three months' term in Congress, filling a vacancy. He introduced the first bill for giving small tracts of government land free to actual settlers, and published an exposure of abuses in the allowance of mileage to members, which corrected the evil, but brought him much personal obloquy. In the National Republican Convention in 1856, not being sent by the Republicans of his own state on account of his opposition to William Seward as a candidate, he secured a delegation for Oregon. President Lincoln in his first address did much to prevent the success of that statesman, and to bring about instead the nomination of Abraham Lincoln. This was attributed by his opponents to personal motives, and a letter from Greeley to Seward, the publication of which he challenged, was produced, to show that in his struggling days he had been wounded at Seward's failure to offer him office. In 1861 he was a candidate for United States senator, his principal opponent being William M. Evarts. When it was clear that Evarts could not be elected, his supporters threw their votes for a third candidate, Ira Harris, who was thus chosen over Greeley by a small majority. At the outbreak of the war he favoured allowing the Southern states to secede, provided a majority of their people at a fair election should so decide, declaring "that he hoped never to live in a Republic whereof one section was pinned to the other by bayonets." When the war began he urged the most vigorous prosecution of it. The "On to Richmond" appeal, which appeared day after day in The Tribune, was incorrectly attributed to him, and it did not wholly meet his approval; but after the defeat in the first battle of Bull Run he was widely esteemed for it. In 1864 he urged negotiations for peace with representatives of the Southern Confederacy in Canada, and was sent by President Lincoln to confer with them. They were found to have no sufficient authority. In 1865 he was one of the Lincoln Presidential electors for New York. At the close of the war, contrary to the general feeling of his party, he urged universal amnesty and impartial suffrage as the basis of reconstruction. In 1867 his friends again wished to elect him to the Senate of the United
States, and the indications were all in his favour. But he refused to be elected under any misapprehension of his attitude, and with what his friends thought unnecessary candour re-stated his obnoxious views on universal amnesty at length, just as the time for the election, with the certainty that this would prevent his success. Some months later he signed the bail bond of Jefferson Davis, and this provoked a torrent of public indignation. He had written a popular history of the late war, the first volume having an immense sale and bringing him unusually large profits. The second was just issued, and the subscribers, in their anger, refused by thousands to receive it. An unsuccessful attempt was also made to expel him from the Union League Club of New York.

In 1867 he was a delegate-at-large to the convention for the reform of the state constitution, and in 1869 and 1870 he was the Republican candidate for controller of the state and member of Congress respectively, but in each case was defeated. He was dissatisfied with General Grant's administration, and became its sharp critic. The discontent which he did much to develop ended in the organization of the Liberal Republican party, which held its National Convention at Cincinnati in 1872, and nominated Greeley for the presidency. For a time the tide of feeling ran strongly in his favour. It was first checked by the action of his life-long opponents, the Democrats, who also nominated him at their National Convention. He expected their support, on account of his attitude toward the South and hostility to Grant, but he thought it a mistake to give him their formal nomination. The event proved his wisdom. Many Republicans who had sympathized with his criticisms of the administration, and with the declaration of principles adopted at the first convention, were repelled by the coalition. This feeling grew stronger until the election. His old party associates regarded him as a renegade, the Democrats gave him a half-hearted support. The tone of the canvass was one of unusual bitterness, amounting sometimes to actual ferocity. In August, on representations of the alarming state of the contest, he took the field in person, and made a series of campaign speeches, beginning in New England and extending throughout Pennsylvania, Ohio and Indiana, which aroused great enthusiasm, and were regarded at the time by both friends and opponents as the most brilliant continuous exhibition of varied intellectual power ever made by a candidate in a presidential canvass. General Grant received in the election 3,307,970 votes, Greeley 2,834,079. The only states Greeley carried, except Georgia, Kentucky, Maryland, Missouri, Tennessee and Texas.

He had resigned his editorship of The Tribune immediately after the nomination; he now resumed it cheerfully; but it was soon apparent that his powers had been overstrained. For years he had suffered greatly from sleeplessness. During the intense excitement of the campaign the difficulty was increased. Returning from his campaign tour, he went immediately to the bedside of his dying wife, and for some weeks had practically no sleep at all. This resulted in an inflammation of the upper membrane of the brain, delirium and death. He expired on the 29th of November 1872. His funeral was a simple but impressive public pageant. The body lay in state in the City Hall, where it was surrounded by crowds of many thousands. The ceremonies were attended by the President and Vice-President of the United States, the Chief-Justice of the Supreme Court, and a large number of eminent public men of both parties, who followed the hearse in a solemn procession, preceded by the mayor and other civic authorities, down Broadway. He had been the target of constant attack during his life, and his personal foibles, careless dress and mental eccentricities were the theme of endless ridicule. But his death revealed the high regard in which he was generally held as a leader of opinion and faithful public servant. "Our late Franklin" Whittier called him, and it is in some such light his countrymen remember him.

In 1852 Greeley visited Europe for the first time, serving as a jurymen at the Crystal Palace Exhibition, appearing before a committee of the House of Commons on newspaper taxes, and urging the repeal of the stamp duty on advertisements. In 1855 he made a second trip to Europe. In Paris he was arrested on the suit of a sculptor, whose statue had been injured in the New York World's Fair (of which he had been a director), and spent two days in Clicy, of which he gave an amusing account. In 1859 he visited California by the overland route, and had numerous public receptions. In 1871 he visited Texas, and his trip through the southern country, where he had once been so hated, was an ovation. About 1852 he purchased a farm at Chappaqua, New York, where he afterwards habitually spent his Saturdays, and experimented in agriculture. He was in constant demand as a lecturer from 1845, when he made his first appearance on the platform, always drew large audiences, and his views were printed by newspapers and periodicals of both political parties, in the form of a series of letters. He wrote sometimes for as much as $6000 or $7000 for a single winter's lecturing. He was also much sought for as a contributor, over his own signature, to the weekly newspapers, and was sometimes largely paid for these articles. In religious faith he was from boyhood a Universalist, and for many years was a conspicuous member of the leading Universalist church in New York.

His published works are: Hints Toward Reforms (1839); Glances at Europe (1851); History of the Struggle for Slavery (1856); The American Conflict (2 vols., 1864-1866); Recollections of a Busy Life (1868); new edition, with appendix containing an account of his later years, his argument with Robert Dale Owen on Marriage and Divorce, and Miscellanea, 1873); Essays on Political Economy (1870); and What I know of Farming (1871). He also assisted his brother-in-law, John F. Cleveland, in editing A Political Text-book (1866), and supervised for many years the annual issues of The Whig Almanac and The Tribune Almanac, comprising extensive political statistics.

The best Lives of Greeley are those by James Parton (New York, 1855; new ed. Boston, 1872) and W. A. Lincoln, who have also been written by U. R. Reavis (New York, 1872), and L. D. Ingersoll (Chicago, 1873); and there is a Memorial of Horace Greeley (New York, 1873).
GREEN, A. H.—GREEN, M.

The funds thus acquired were, to a large extent, expended in making public improvements. A clause inserted in all deeds forbade the sale of intoxicating liquors on the land concerned, under pain of the reversion of such property to the colony. The initiation fees ($5) were used for the expenses of locating the colony, and the membership certificate fees ($40) were expended in the construction of irrigating ditches; and he bought the money received from the sale of town lots, except about $13,000 invested in a school building (now the Meeker Building). Greeley was organized as a town in 1871, and was chartered as a city of the second class in 1886. The “Union Colony of Colorado” still exists as an incorporated body and holds reversionary rights in streets, alleys and public grounds, and in all places “where intoxicating liquors are manufactured, sold or given away, as a beverage.”

GREEN, ALEXANDER HENRY (1827–1896), English geologist, son of the Rev. Thomas Sheldon Green, master of the Ashby Grammar School, was born at Maidstone on the 10th of October 1832. He was educated partly at his father’s school, Ashby-de-la-Zouch, and afterwards at Gonville and Caius College, Cambridge, where he graduated as sixth wrangler in 1855 and was elected a fellow of his college. In 1861 he joined the Geological Survey of Great Britain, and surveyed large areas of the midland counties, Derbyshire and Yorkshire. He wrote (wholly or in part) memoirs on the Geology of Banbury (1864), of Stockport (1866), which he edited (1887), and of the Yorkshire Coal-field (1878). In 1874 he retired from the Geological Survey, having been appointed professor of geology in the Yorkshire College at Leeds; in 1885 he became also professor of mathematics, while for many years he held the lectureship on geology at the school of military engineering at Chatham. He was elected F.R.S. in 1886, and two years later was chosen professor of geology in the university of Oxford. His manual of Physical Geology (1876, 3rd ed. 1882) is an excellent book. He died at Boar’s Hill, Oxford, on the 19th of August 1896.

A portrait of him, with brief memoir, was published in Proc. Yorks. Geol. and Polytechnic Soc., xii. 232.

GREEN, DUFF (1791–1875), American politician and journalist, was born in Woodford county, Kentucky, on the 15th of August 1791. He was a school teacher in his native state, served during the War of 1812 in the Kentucky militia, and then settled in Missouri, where he worked as a schoolmaster and practised law. He was a member of the Missouri Constitutional Convention of 1820, and was elected to the state House of Representatives in 1820 and to the state Senate in 1822, serving one term in each house. Becoming interested in journalism, he purchased and for two years edited the St Louis Republican, and afterwards edited in Washington, D.C., The United States Telegraph, which soon became the principal organ of the Jackson men in opposition to the Adams administration. Upon Andrew Jackson’s election to the presidency, the Telegraph became the principal mouthpiece of the administration, and received printing patronage estimated in value at $50,000 a year, while Green became one of the coterie of unofficial advisers of Jackson known as the “Kitchen Cabinet.” In the quarrel between Jackson and Calhoun, Green supported the latter, and through the columns of the Telegraph violently attacked the administration. In consequence, his paper was deprived of the government printing in the spring of 1831. Green, however, continued to edit it in the Calhoun interest until 1835, and gave vigorous support to that leader’s nullification views. From 1835 to 1838 he edited The Reformation, a radically partisan publication, devoted to free trade and the extreme states’ rights theory. In 1841–1843 he was in Europe on behalf of the Tyler administration, and he is said to have been instrumental in causing the appointment of Lord Ashburton to negotiate in Washington concerning the boundary dispute between Maine and Canada. In January 1843 Green established in New York City a short-lived journal, The Republic, to combat the spoils system and to advocate free trade. In September 1844 Calhoun, then secretary of state, sent Green to Texas ostensibly as consul at Galveston,

but actually, it appears, to report to the administration, then considering the question of the annexation of Texas, concerning the political situation in Texas and Mexico. After the close of the war with Mexico Green was sent to that country in 1849 by President Taylor to negotiate concerning the moneys which, by the treaty of Guadalupe Hidalgo, the United States had agreed to pay; and he succeeded in getting a sum considerable for arranging for payment in exchange instead of in specie. Subsequently Green was engaged in railway building in Georgia and Alabama. On the 10th of June 1875 he died in Dalton, Georgia, a city which in 1848 he had helped to found.

GREEN, JOHN RICHARD (1837–1883), English historian, was born at Oxford on 12th December 1837, and educated at Magdalen College School and at Jesus College, where he obtained an open scholarship. On leaving Oxford he took orders and became the incumbent of St Philip’s, Stepney. His preaching was eloquent and able; he worked diligently among his poor parishioners and won their affection by his ready sympathy. Meanwhile he studied history in a scholarly fashion, and wrote much for the Saturday Review. Partly because his health was weak and partly because he ceased to agree with the teaching of the Church of England, he abandoned clerical life and devoted himself to history; in 1868 he took the post of librarian at Lambeth, but his health was already breaking down and he was attacked by consumption. His Short History of the English People (1874) at once attained extraordinary popularity, and his The Story of England (1883) has been still more unexpectedly successful. In the preface to his History of England Green is pre-eminently a picturesque historian; he had a vivid imagination and a keen eye for colour. His chief aim was to depict the progressive life of the English people rather than to write a political history of the English state. In accomplishing this aim he worked up the results of wide reading into a series of brilliant pictures. While generally accurate in his statement of facts, and showing a firm grasp of the main tendency of a period, he often builds more on his authorities than is warranted by their words, and is apt to overlook points which would have forced him to modify his representations and lower the level of his colours. From his animated pages thousands have learned to take pleasure in the history of their own people, but could scarcely learn to appreciate the complexity inherent in all historical movement. His style is extremely bright, but it lacks sobriety and presents some affectations. His later histories, The Making of England (1882) and The Conquest of England (1883), are more soberly written than his earlier books, and are valuable contributions to historical knowledge. Green died at Mentone on the 7th of March 1883. He was a singularly attractive man, of wide intellectual sympathies and an enthusiastic temper: by his bedside he could be expected to be a brilliant talker; and his work was done with admirable courage in spite of ill-health. It is said that Mrs Humphry Ward’s Robert Elsmere is largely a portrait of him. In 1877 Green married Miss Alice Stopford; and Mrs Green, besides writing a memoir of her husband, prefixed to the 1888 edition of his Short History, has herself done valuable work as an historian, particularly in her Henry II. in the “English Statesmen” series (1888), her Town Life in the 15th Century (1894), and The Making of Ireland and its Undoing (1908).

See the Letters of J. R. Green (1901), edited by Leslie Stephen.

GREEN, MATTHEW (1606–1737), English poet, was born of Nonconformist parents. He had a post in the custom house, and the few anecdotes that have been preserved of him show him to have been as witty as his poems would lead one to expect. He died unmarried at his lodging in Nag’s Head Court, Gracechurch Street, in 1737. His Grotto, a poem on Queen Caroline’s grotto at Richmond, was printed in 1732; and his chief poem, The Spleen, in 1737 with a preface by his friend Richard Glover. These and some other short poems were printed in Dodsley’s collection (1748), and subsequently in various editions of the British poets. They were edited in 1796 with a preface by Dr Aikin and in 1883 by R. E. A. Willmott with the poems of Gray and others. The Spleen is an epistle to Mr Cuthbert Jackson,
advocating cheerfulness, exercise and a quiet content as remedies. It is full of witty sayings. Thomas Gray said of it: "There is a profusion of wit everywhere; reading would have formed his judgment, and harmonized his verse, for even his wood-notes often break out into strains of real poetry and music."

GREEN, THOMAS HILL (1836-1882), English philosopher, the most typical English representative of the school of thought called Neo-Kantian, or Neo-Hegelian, was born on the 7th of April 1836 at Birkin, a village in the West Riding of Yorkshire, of which his father was rector. On the paternal side he was descended from Oliver Cromwell, whose honest, sturdy independence of character he seemed to have inherited. His education was conducted entirely at home until, at the age of fourteen, he entered Rugby, where he remained five years. In 1855 he became an undergraduate member of Balliol College, Oxford, of which society he was, in 1860, elected fellow. His life, henceforth, was devoted to teaching (mainly philosophical) in the university—first as college tutor, afterwards, from 1878 until his death (at Oxford on the 26th of March 1882) as Whyte's Professor of Moral Philosophy. The lectures he delivered as professor form the substance of his two most important works, viz. the *Prolegomena to Ethics* and the *Lectures on the Principles of Political Obligation*, which contain the whole of his positive constructive teaching. These works were not published until after his death, but Green's views were previously known indirectly through the *Introduction* to the standard edition of Hume's works by Green and T. H. Grose (d. 1906), fellow of Queen's College, in which the principle of *direct evidence* and "or "empirical" philosophy was exhaustively examined.

Hume's empiricism, combined with a belief in biological evolution (derived from Herbert Spencer), was the chief feature in English thought during the third quarter of the 19th century. Green represents primarily the reaction against doctrines which, when carried out to their logical conclusion, not only "rendered all philosophy futile," but were fatal to practical life. By reducing the human mind to a series of unrelated atomic sensations, this teaching destroyed the possibility of knowledge, and further, by representing man as a "being who is simply the result of natural forces," it made conduct, or any theory of conduct, meaningless; for life in any human, intelligible sense implies a personal self which (1) *knows* what to do, (2) has *power* to do it. Green was thus driven, not theoretically, but as a practical necessity, to raise again the whole question of man in relation to nature. When (he held) we have discovered what man in himself is, and what his relation to his environment, we shall then know his function—what he is fitted to do. In the light of this knowledge we shall be able to formulate the moral code, which, in turn, will serve as a criterion of actual civic and social institutions. These form, naturally and necessarily, the objective expression of moral ideas, and it is in some civic or social whole that the moral ideal must finally take concrete shape.

To ask "What is man?" is to ask "What is experience?" for experience means that of which I am conscious. The facts of consciousness are the only facts which, to begin with, are justified in asserting to exist. On the other hand, they are valid evidence for whatever is necessary to their own explanation, *i.e.* for whatever is logically involved in them. Now the most striking character of man is that he is a *being who marks him special* both with other animals, is *self-conscious*. The simplest mental act into which we can analyse the operations of the human mind—the act of sense-perception—is never merely a *change*, physical or psychical, but *is the consciousness of a change*. Human experience consists, not of processes in an animal organism, but of these processes recognized as such. That which we perceive is from the outset an apprehended fact—that is to say, it cannot be analysed into isolated elements (so-called sensations) which, as such, are not constituents of consciousness at all, but exists from the first as a synthesis of relations in a consciousness which keeps distinct the "self" and the various elements of the "object," though holding all together in the unity of the act of perception. In other words, the whole mental structure we call knowledge consists, in its simplest equally with its most complex constituents, of the "work of the mind." Locke and Hume held that the work of the mind was *eo ipso* unreal because it was "made by" man and not "given to" man. It thus represented a subjective creation, not an objective fact. But this consequence follows only upon the assumption that the work of the mind is arbitrary, an assumption shown to be unjustified by the results of exact science, with the distinction universally recognized, which such science draws between truth and falsehood, between the real and "mere ideas." This (obviously valid) distinction logically involves the consequence that the object, or content, of knowledge, viz. reality, is an intelligible ideal reality, a system of thought relations, a spiritual cosmos. How is the existence of this ideal whole to be accounted for? Only by the existence of some "principle which renders all relations possible and is itself determined by none of them"; an eternal self-consciousness which knows in whole what we know in part. To God the world is, to man the world becomes. Human experience is God gradually made manifest.

Carrying on the same analytical method into the special department of moral philosophy, Green held that ethics applies to the peculiar conditions of social life that investigation into man's nature which metaphysics began. The faculty employed in this further investigation is no "separate moral faculty," but that same reason which is the source of all our knowledge—ethical and other. Self-reflection gradually reveals to us human capacity, human function, with, consequently, human responsibility. It brings out into clear consciousness certain potentialities in man's nature which have remained unrecognised, which have been presented as separate and arbitrary; and the result of this analysis, combined with an investigation into the surroundings men live in, a "content"—a moral code—becomes gradually evolved. Personal good is perceived to be realizable only by making actual the conceptions thus arrived at. So long as these remain potential or ideal, they form the motive of action; motive consisting always in the idea of some "end" or "good" which man presents to himself as an end in the attainment of which he would be satisfied, that is, in the realization of which he would find his true self. The determination to realize the self in some definite way constitutes an "act of will," which, as thus constituted, is neither arbitrary nor externally determined. For the motive which may be said to be its cause lies in the man himself, and the identification of the self with such a motive is a self-determination, which is at once both rational and free. The "freedom of man" is constituted, not by a supposed ability to do anything he may choose, but in the power to identify himself with that true good which reason reveals to him as his true good. This good consists in the realization of personal character; hence the final good, *i.e.* the moral ideal, as a whole, can be realized only in some society of persons who, while remaining true to themselves in the sense that their individuality is not lost but rendered more perfect, find this predestination allowable only when the separate individualities are integrated as part of a social whole. Society is as necessary to form persons as persons are to constitute society. Social union is the indispensable condition of the development of the special capacities of the individual members. Human self-perfection cannot be gained in isolation; it is attainable only in inter-relation with fellow-citizens in the social community.

The law of our being, so revealed, involves in its turn civic or political relations. Moral goodness cannot be limited to, still less constituted by, the cultivation of self-regarding virtues, but consists in the attempt to realize in practice that moral ideal which self-analysis has revealed to us as our ideal. From this fact arises the ground of political obligation, for the institutions of political or civic life are the concrete embodiment of moral ideas in terms of our day and generation. But, as society exists only for the proper development of persons, we have a criterion by which to test these institutions, viz. do they, or do they not, contribute to the development of moral character in the individual citizen? It is obvious that the final moral ideal is not realized in any body of civic institutions actually existing, but the same analysis which demonstrates this deficiency points out the direction which a true development will take. Hence arises the
conception of rights and duties which should be maintained by law, as opposed to those actually maintained; with the further consequence that it may become necessary to rebel against the state in the interest of the state itself, that is, in order better to subordinate that end or function which constitutes the raison d'être of the state. The state does not consist in any definite concrete organization formed once for all. It represents a "general will" which is a desire for a common good. Its basis is not a coercive authority imposed upon the citizens from without, but consists in the spiritual recognition, on the part of the citizens, of that which constitutes their true nature. "Will, not force, is the basis of the state."

Green's philosophical doctrine, proper, the most striking characteristic is Integration, as opposed to Disintegration, both in thought and in reality. "That which is" is a whole, not an aggregate; an organic combination of parts, not a mechanistic mass; "whole" thought as well as material but spiritual, a "world of thought-relations."

On the critical side this teaching is now admittedly valid against the older empiricism, and the cogency of the reasoning by which his opponents have been opposed (a criticism of which was not, nevertheless, Green's statement of his conclusions presents important difficulties. Even apart from the impossibility of conceiving a whole of relations which are relatively not only of each other but also of the whole to the external, no explanation is given of the fact (obvious in experience) that the spiritual entities of which the Universe is composed appear material. Certain elements present themselves in feeling which seem stubbornly to resist any attempt to explain them in terms of thought. While, again, legitimately insisting upon personality as a fundamental constituent in any true theory of reality, the relation between human individualities and the divine Person is left vague and obscure; nor is it evident to see how the existence of several individualities—human or divine—in one cosmos is theoretically possible. It is at the solution of these two problems that that philosophy in the immediate future may be expected to work.

Green's most important treatise—the Prolegomena to Ethics—practically complete in manuscript at his death—was published in the year following, under the editorship of A. C. Bradley (4th ed. 1899). Shortly afterwards R. L. Nettleship's standard edition of his Works (exclusive of the Prolegomena) appeared in three volumes: vol. i. containing reprints of Green's criticism of Hume, Spencer, Lewes; vol. ii. Lectures on Kant, on Logic, on Political Obligation; vol. iii. Miscellanies, preceded by a full Memoir by the Editor. The Principles of Political Obligation was afterwards published separately, as well as his "Abridgment of the Kantian System," which was found in Andrew Seth (Fringle Patterson), Hegelianism and Personality. See also articles in Mind (January and April 1884) by A. J. Balfour and Henry Sidgwick, in the Academy (xxvii. 242 and xxi. 249) on the same subject; in the Review of Reviews (1884-5) by S. S. Laurie; W. H. Fairbrother, Philosophy of T. H. Green (London and New York, 1896); D. G. Ritchie, The Principles of State and Social Speculations (1899); J. S. Haldane, Lectures on the Philosophy of Kant (London, 1903). J. H. Muirhead, The Service of the State: Four Lectures on the Political Teaching of T. H. Green (1908); A. W. Benn, English Rationalism in the XIX Century (1900), vol. ii. pp. 401 foll.

GREEN, VALENTINE (1739-1813), British engraver, was born at Halesowen. He was placed by his father in a solicitor's office at Evesham, where he remained for two years; but ultimately he decided, on his own responsibility, to abandon the legal profession and became a pupil of a fine engraver at Worcester. In 1765 he migrated to London and began work as a mezzotint engraver, having taught himself the technicalities of this art, and quickly rose to a position in absolutely the front rank of British engravers. He became a member of the Incorporated Society of Artists in 1769, an associate-engraver of the Royal Academy in 1775, and for some forty years he followed his profession with the greatest success. The exclusive right of engraving and publishing plates from the pictures in the Düsseldorf gallery was granted by the duke of Bavaria in 1789, but, after he had issued more than twenty of these plates, the siege of that city by the French put an end to this undertaking and caused him serious financial loss. From this cause, and through the failure of certain other speculations, he was reduced to poverty; and in consequence he took the post of keeper of the British Institution in 1809, and continued in this office for the remainder of his life. During his career as an engraver he produced some hundred plates after portraits by Reynolds, Romney, and other British artists, after the compositions of Benjamin West, and after pictures by Van Dyck, Rubens, Murillo, and other old masters. It is claimed for him that he was one of the first engravers to show how admirably mezzotint could be applied to the translation of pictorial compositions as well as portraits, but at the present time it is to his portraits that most attention is given by collectors. His engravings are distinguished by exceptional richness and subtlety of tone, and by very judicious management of relations of light and shade; and they have, almost without exception, notable freshness and grace of handling.

See Valentine Green, by Alfred Whitman (London, 1902).

GREEN, WILLIAM HENRY (1825-1900), American Hebrew scholar, was born in Groovsville, near Bordentown, New Jersey, on the 27th of January 1825. He was descended in the sixth generation from Jonathan Dickinson, first president of the College of New Jersey (now Princeton University), and his ancestors had been closely connected with the Presbyterian church. He graduated in 1840 from Lafayette College, where he was tutor in mathematics (1840-1842) and adjunct professor (1843-1844). In 1846 he graduated from Princeton Theological Seminary. For a time he was professor in Heidelberg University; but in 1848 he was ordained and was pastor of the Central Presbyterian church of Philadelphia in 1849-1851. From August 1851 until his death, in Princeton, New Jersey, on the 10th of February 1900, he was professor of Biblical and Oriental Literature in Princeton Theological Seminary. From 1859 the title of his chair was Old Testament, and Oriental and Testaments. In 1886 he refused the presidency of Princeton College; as senior professor he was long acting head of the Theological Seminary. He was a great Hebrew teacher: his Grammar of the Hebrew Language (1868, revised 1887) was a standard improvement in method on Gesenius, Roeder, Ewald and Nordheimer. All his knowledge of Semitic languages he used in a "conservative Higher Criticism," which is maintained in the following works: The Pentateuch Vindicated from the Aspersions of Bishop Colenso (1863), Moses and the Prophets (1883), The Hebrew Feasts in their Relation to Recent Critical Hypotheses Concerning the Pentateuch (1883), The Unity of the Book of Genesis (1895), The Higher Criticism of the Pentateuch (1895), and A General Introduction to the Old Testament, vol. i. Canon (1898), vol. ii. Text (1899). He was the scholarly leader of the "Higher Criticism" in the American church, and was the moderator of the General Assembly of 1891. Green was chairman of the Old Testament committee of the Anglo-American Bible revision committee.

GREENAWAY, KATE (1846-1901), English artist and book illustrator, was the daughter of John Greenaway, a well-known draughtsman and engraver on wood, and was born in London on the 17th of March 1846. After a course of study at South Kensington, at "Heatherley's" life classes, and at the Slade School, Kate Greenaway began, in 1868, to exhibit water-colour drawings at the Dudley Gallery, London. Her more remarkable early work, however, consisted of Christmas cards, which, by reason of their quaint beauty of design and charm of draughtsmanship, enjoyed an extraordinary vogue. Her subjects were, in the main, young girls, children, flowers, and landscape; and the air of artless simplicity, freshness, humour, and purity of these little works so appealed to public and artists alike that the enthusiastic welcome habitually accorded to them is to be attributed to something more than love of novelty. In the lines she had struck out Kate Greenaway was encouraged by H. Stacy Marks, R.A., and she refused to listen to those friends who urged her to return to a more conventional manner. Thenceforward her illustrations for children (such as for Little Folks, 1873, et seq.) attracted much attention.

In 1877 her drawings at the Dudley Gallery were sold for £4, and her Royal Academy picture for eighteen guineas; and in the same year she began to draw for the
GREENBACKS—GREENCASTLE

Illustrated London News. In the year 1879 she produced Under the Window, of which 150,000 copies are said to have been sold, and of which French and German editions were also issued. Then followed The Birthday Book, Mother Goose, Little Ann; and other books for children which were appreciated not less by adults, and were to be found on sale in the bookshops of every capital in Europe and in the cities of America. The extraordinarily successful and extremely remunerative effort was financed and remunerated by the amounts paid to her as her share of the profits: for Under the Window she received £1,130; for The Birthday Book, £1,750; for Mother Goose, £905; and for Little Ann, £567. These four books alone produced a clear return of £8000. "Toy-books" though they were, these little works created a revolution in illustration, and so were of real importance; they were loudly applauded by John Ruskin (Art of England and Fors Clavigera), by Ernest Chesneau and Arsène Alexandre in France, by Dr. Muther in Germany, and by leading art-critics throughout the world. In 1890 Kate Greenaway was elected a member of the Royal Institute of Painters in Water Colours, and in 1891, 1894 and 1898 she exhibited water-colour drawings, including illustrations for her books, at the gallery of the Fine Art Society (by which a representative selection was exhibited in 1902), where they surprised the world by the infinite delicacy, tenderness, and grace which they displayed. A leading feature in Miss Greenaway's work was her revival of the delightfully quaint costume of the beginning of the 19th century; this lent humour to her fancy, and so captivated the public taste that it has been said, with poetic exaggeration, that "Kate Greenaway dressed the children of two centuries." Her drawings of children have been compared with Stothard's for grace and with Reynolds's for naturalness, and those of flowers with the work of van Huysum and Botticelli. From 1883 to 1897, with a break only in 1890, she issued a series of Kate Greenaway's Almanacs. Although she illustrated The Pied Piper of Hamelin and other works, the artist preferred to provide her own text; the numerous verses which were found among her papers after her death prove that she might have added to her reputation with her pen. She had great charm of character, but was extremely shy of public notice, and not least modest in private life. She died at Hampstead on the 6th of November 1901.

(M. H. S.)

GREENBACKS, a form of paper currency in the United States, so named from the green colour used on the backs of the notes. They are treasury notes, and were first issued by the government in 1862, "as a question of hard necessity," to meet the war expenses. In the first days of the War the government, following the example of the banks, had suspended specie payment. The new notes were therefore for the time being an inconvertible paper currency, and, since they were made legal tender, were really a form of fiat money. The first act, providing for the issue of notes to the amount of $10,000,000, was that of the 25th February 1862; the acts of 11th July 1862 and 3rd March 1863 each authorized further issues of $15,000,000. The notes soon depreciated in value, and at the lowest were worth only 35 cents on the dollar. The act of 12th April 1866 authorized the retirement of $10,000,000 of notes within six months and of $4,000,000 per month thereafter; this was continued by act of 4th February 1868. On 1st January 1870 specie payment was resumed, and the nominal amount of notes then stood at $34,668,000, which is still outstanding.

The so-called Greenback party (also called the Independent, and the National party) first appeared in a presidential campaign in 1876, when its candidate, Peter Cooper, received 94,740 votes. It advocated increasing the volume of greenbacks, forbidding bank issues, and the paying in greenbacks of the principal of all government bonds and interest thereon. The theory of greenbacks by various speculations, cast over 1,000,000 votes and elected 14 Congressmen; and in 1888 there was fusion with labour reformers and it cast 308,378 votes for its presidential candidate, J. B. Weaver, and elected 8 Congressmen. In 1884 their candidate Benjamin F. Butler (also the candidate of the Anti-Monopoly party) received 175,370 votes. Subsequently the party went out of existence.

GREEN BAY, a city and the county-seat of Brown county, Wisconsin, U.S.A., at the S. extremity of Green Bay, at the mouth of the Fox river, 114 m. N. of Milwaukee. Pop. (1890) 9096; (1900) 18,684, of whom 402 were foreign-born and 33 were negroes; (1910 census) 25,236. The city is served by the Chicago & North-Western, the Chicago, Milwaukee, St Paul, the Kewaunee, Green Bay & Western, and the Green Bay & Western railways, by an inter-urban electric railway connecting with other Fox River Valley cities and by lake and river steamboat lines. Green Bay lies on high level ground on both sides of the river, which is here crossed by several bridges. The city has the Kellogg Public Library, the Brown County Court House, two high schools, a business college, several academies, two hospitals, an orphan asylum and the State Odd Fellows' Home. It is the seat of a Roman Catholic cathedral, the bishopric being the earliest established in the North-west. The so-called "Tank Cottage," now in Washington Park, is said to have been the oldest house in Wisconsin; it was built on the W. bank of the river near its mouth by Joseph Roy, a French-Canadian voyageur, in 1766, was subsequently somewhat modified, and in 1908 was bought and removed to its present site by the Green Bay Historical Society. Midway between Green Bay and De Pere (5 m. S.W. of Green Bay) is the state reformatory, opened in 1899-1901. Green Bay's fine harbour accommodates a considerable lake commerce, and the city is the most important railway and wholesale distributing centre in N.E. Wisconsin. Its manufactures include lumber and lumber products, furniture, wagons, woodenware, farm implements and machinery, flour, sugar, and tile and dairy products; and it has lumber yards, grain elevators, fish warehouses and railway repair shops. The total value of the factory product in 1905 was $4,873,027, an increase of 76.9% since 1900. The first recorded visit of a European to the vicinity of what is now Green Bay is that of Jean Nicolet, who was sent west by Champlain in 1634, and found, probably at the Red Banks, some 10 m. below the present city, a village of Winnebago Indians, who he thought at first were French. Between 1654 and 1658 Radisson and Groscilliers and other coureurs des bois were at Green Bay. In 1718 Jean Allouez, the Jesuit missionary, established a mission on the W. shore of the bay, about 20 m. from the present city. Later he removed his mission to the Red Banks, and in the winter of 1671-1672 established it permanently 5 m. above the present city, at Rapides des Pères, on the E. shore of the Fox river. In 1673 Joliet and Marquette visited the spot. In 1683-1685 Le Sueur and Nicholas Perrot traded with the Indians here. In 1718-1720 Fort St Francis was erected at the mouth of the river and the W. bank, and after being several times deserted was permanently re-established in 1722. About 1745 Augustin de Langlade established a trading post at La Baye and later brought his family there from Mackinac. This was the first permanent settlement at Green Bay and in Wisconsin. The British garrison which occupied the fort from 1761 to 1763, during which time the fort received the name of Fort Edward Augustus, was removed at the time of Pontiac's rising, and the fort was never re-garrisoned by the English, except for a short time during the War of 1812. The inhabitants of La Baye were, however, acknowledged subjects of Great Britain, the jurisdiction of the United States being practically a dead letter until the American fort (Fort Howard) was garrisoned in 1816. As early as 1810 fur traders, employed by John Jacob Astor, were stationed here; about 1820 Astor erected a warehouse and other buildings; and for many years Green Bay consisted of two distinct settlements, Astor and Navarino, which were finally united in 1839 as Green Bay. The city was chartered in 1834. In 1863 Fort Howard was consolidated with it. The Green Bay Intelligencer, the first newspaper in Wisconsin, began publication here in 1833.

See Neville and Martin, Historic Green Bay (Green Bay, 1893); and Martin and Beaumont, Old Green Bay (Green Bay, 1900).

GREENCASTLE, a city and the county-seat of Putnam county, Indiana, U.S.A., about 38 m. W. by S. of Indianapolis and on the Big Walnut river. Pop. (1900) 3661; (1910) 3790. It is served by the Cleveland, Cincinnati, Chicago & St. Louis,
the Chicago, Indianapolis & Louisville, the Vandalia, and the Terre Haute, Indianapolis & Eastern (electric) railways. It has manufactures of some importance, including lumber, pumps, kitchen-cabinets, drag-saws, lightning-rod and tin-plate, is in the midst of a blue grass region, and is a shipping point for beef cattle. The city has a Carnegie library and is the seat of the De Paul University (co-educational), a Methodist Episcopal institution, founded as Indiana Asbury University in 1837, and renamed in 1884 in honour of Washington Charles de Paul (1822-1887), a successful capitalist, banker and glass manufacturer. The total gifts of Mr de Paul and his family to the institution amount to about $600,000. Among the presidents of the university have been Bishop Matthew Simpson, Bishop Thomas Bowman (b. 1817), and Bishop Edwin Holt Hughes (b. 1866), all of the Methodist Episcopal church. The university comprises the Asbury College of Liberal Arts, a School of Music, a School of Art and an Academy, and had in 1909-1900 43 instructors, a library of 17,000 volumes, and 1071 students. Greenesce was first settled about 1820, and was chartered as a city in 1861.

GREENE, GEORGE WASHINGTON (1817-1885), American historian, was born at East Greenwich, Rhode Island, on the 8th of April 1817, the grandson of Major-General Nathanael Greene. He entered Brown University in 1824, left in his junior year on account of ill-health, was in Europe during the next twenty years, except in 1833-1834, when he was principal of Kent Academy at East Greenwich, and was the United States consul at Rome from 1837 to 1845. He was instructor of modern languages in Brown University from 1848 to 1852; and in 1871-1875 was non-resident lecturer in American history in Cornell University. He died at East Greenwich, Rhode Island, on the 2nd of February 1883. His published works include French and Italian text-books; Historical Studies (1850); Biographical Studies (1860); Historical View of the American Revolution (1865); Life of Nathanael Greene (3 vols., 1867-1871); The German Element in the War of American Independence (1876); and a Short History of Rhode Island (1877).

GREENE, MAURICE (1805-1755) English musical composer, was born in London. He was the son of a clergyman in the city, and soon became a chorister of St Paul's cathedral, where he studied under Charles King, and subsequently under Richard Brind, organist of the cathedral from 1707 to 1718, whom, on his death in the last-named year, he succeeded. Nine years later he became organist and composer to the chapel royal, on the death of Dr Croft. In 1730 he was elected to the chair of music in the university of Cambridge, and had the degree of doctor of music conferred on him. Dr Croft was a voluminous composer, and his collection Forty Select Anthems became a standard work of its kind. He wrote a "Te Deum," several oratorios, a masque, The Judgment of Hercules, and a pastoral opera, Phoebus (1748); also glees and catches; and a collection of Catches and Canons for Three and Four Voices is amongst his compositions. In addition he composed many occasional pieces for the king's birthday, having been appointed master of the king's band in 1735. But it is as a composer of church music that Greene is chiefly remembered. In his books he has a contrapuntal quality and his harmonic treatment is free and was admired by those who knew of him. One of his compositions, that of the 14th is a work of unusual beauty and is still preserved in some of our choirs. Greene, in conjunction with the violinist Michael Christian Festing (1727-1752) and others, originated the Society of Musicians, for the support of poor artists and their families.

He died on the 1st of December 1755.

GREENE, NATHANAEL (1742-1786), American general, son of a Quaker farmer and smith, was born at Potowomut, in the township of Warwick, Rhode Island, on the 5th of August (not, as has been stated, 6th of June) 1742. Though his father's sect discouraged "literary accomplishments," he acquired a large amount of general information, and made a special study of mathematics, history and law. At Coventry, R.I., whither he removed in 1770 to take charge of a forge built by his father and his uncles, he was the first to urge the establishment of a public school; and in the same year he was chosen a member of the legislature of Rhode Island, to which he was re-elected in 1771, 1772 and 1775. He sympathized strongly with the Whig, or Patriot, element among the colonialists, and in 1774 joined the local militia. At this time he began to study the art of war. In December 1774 he was on a committee appointed by the assembly to revise the militia laws. His zeal in attending to military duty led to his expulsion from the Society of Friends.

In 1775, in command of the contingent raised by Rhode Island, he joined the American forces at Cambridge, and on the 22nd of June was appointed a brigadier by Congress. To him Washington assigned the command of the city of Boston after it was evacuated by Howe in March 1776. Greene's letters from October 1775 and January 1776 to Samuel Ward, then a delegate from Rhode Island to the Continental Congress, favoured a declaration of independence. On the 9th of August 1776 he was promoted to be one of the four new major-generals and was put in command of the Continental troops on Long Island; he chose the place for fortifications (practically the same as that picked by General Charles Lee) and built the redoubts and entrenchments of Fort Greene on Brooklyn Heights. Severe illness prevented his taking part in the battle of Long Island. He was prominent among those who advised a retreat from New York and the burning of the city, so that the British might not enter Greene was placed in command of Fort Lee, and on the 29th of October 1777 succeeded General Israel Putnam in command of Fort Washington. He received orders from Washington to defend Fort Washington to the last extremity, and on the 11th of October Congress had passed a resolution to the same effect; but later Washington wrote to him to use his own discretion. Greene ordered Colonel Magaw, who was in immediate command, to defend the place until he should hear from him again, and reinforced it to meet General Howe's attack. Nevertheless, the blame for the losses of Forts Washington and Lee was put upon Greene, but apparently without his losing the confidence of Washington, who indeed assumed the responsibility. At Trenton Greene commanded one of the two American columns, his own, accompanied by Washington, arriving first; and after the victory here he urged Washington to push on immediately to Princeton, but was overruled by a council of war. At the Brandywine Greene commanded the reserve. At Germantown Greene's command, having a greater distance to march than the right wing under Sullivan, failed to arrive in good time—a failure which Greene himself thought (without cause) would cost him Washington's regard; on this, with the affair of Fort Washington, Bancroft based his favourable opinion of Greene's ability. But on their arrival, Greene and his troops distinguished themselves greatly.

At the urgent request of Washington, on the 2nd of March 1778, at Valley Forge, he accepted the office of quartermaster-general (succeeding Thomas Mifflin), and of his conduct in this difficult work, which Washington heartily approved, a modern critic, Colonel H. B. Carrington, has said that it was "as good as was possible under the circumstances of that fluctuating war." Greene had become quartermaster-general on account of the understanding, however, that he was to command troops in the field; thus we find him at the head of the right wing at Monmouth on the 28th of June. In August Greene and Lafayette commanded the land forces sent to Rhode Island to co-operate with the French on d'Estaing, in an expedition which proved abortive. In June 1780 Greene commanded in a skirmish at Springfield, New Jersey. In August he resigned the office of quartermaster-general; after a long and bitter struggle with Congress over the interference in army administration by the Treasury Board and by commissions appointed by Congress. Before his resignation became effective, it fell to his lot to preside over the court which, on the 29th of September, condemned Major John André to death.

On the 14th of October he succeeded Gates as commander-in-chief of the Southern army, and took command at Charlotte, N.C.,
on the 2nd of December. The army was weak and badly equipped and was opposed by a superior force under Cornwallis. Greene decided to divide his own troops, thus forcing the division of the British as well, and creating the possibility of a strategic interplay of forces. This strategy led to General Daniel Morgan's victory of Cowpens (just over the South Carolina line) on the 17th of January 1781, and to the battle at Guilford Court House, N.C. (March 15), in which after having weakened the British troops by continual movements, and drawn in reinforcements for his own army, Greene was defeated indeed, but only at such cost to the victor that Tarleton called it "the pledge of ultimate defeat." Three days after this battle Cornwallis withdrew toward Wilmington. Greene's generalship and judgment were again conspicuously illustrated in the next few weeks, in which he allowed Cornwallis to march north to Virginia and himself turned swiftly to the reconquest of the inner country of South Carolina. This, in spite of a reverse sustained at Lord Rawdon's hands at Hobkirk's Hill (2 m. N. of Camden) on the 25th of April, he achieved by the end of June, the British retiring to the coast. Greene then gave his forces a six weeks' rest on the High Hills of the Santee, and on the 8th of September, with 2600 men, engaged the British under Lieut.-Colonel James Stuart (who had succeeded Lord Rawdon) at Eutaw Springs; the battle, although tactically drawn, so weakened the British that they withdrew to Charleston, where Greene penned them during the remaining months of the war. Greene's Southern campaign showed remarkable strategic features that remind one of those of Turenne, the commander whom he had taken as his model in his studies before the war. He excelled in dividing, eluding, and tires his opponent by long marches, and in general conflict forcing him to pay for a temporary advantage a price that he could not afford. He was greatly assisted by able subordinates, including the Polish engineer, Tadeusz Kosciusko, the brilliant cavalry captains, Henry ("Light-Horse Harry") Lee and William Washington, and the partisan leaders, Thomas Sumter and Francis Marion.

South Carolina and Georgia voted Greene liberal grants of lands and money. The South Carolina estate, Boone's Barony, S. of Edisto in Bamberg County, he sold to meet bills for the rations of his Southern army. On the Georgia estate, Mulberry Grove, 14 m. above Savannah, on the river, he settled in 1785, after twice refusing (1781 and 1784) the post of secretary of war, and there he died of sunstroke on the 19th of June 1786. Greene was a singularly able, and—like other prominent generals on the American side—a self-trained soldier, and was second only to Washington among the officers of the American army in military ability. Like Washington he had the great gift of using small means to the utmost advantage. His attitude towards the Tories was humane and even kindly, and he granted a pardon to his former opponents after his return to the South, and when Gates's conduct of the campaign in the South was criticized. There is a monument to Greene in Savannah (1839). His statue, with that of Roger Williams, represents the state of Rhode Island in the National Hall of Statuary in the Capitol at Washington; in the same city there is a bronze equestrian statue of him by H. K. Brown.

See the Life of Nathanael Greene (3 vols., 1867-1871), by his grandson, George W. Greene, and the biography (New York, 1893), by Brig. General E. W. Greene in the University of Southern California Library.

GREENE, ROBERT (c. 1560-1592), English dramatist and miscellaneous writer, was born at Norwich about 1560. The identity of his father has been disputed, but there is every reason to believe that he belonged to the tradesmen's class and had small means. It is doubtful whether Robert Greene attended Norwich grammar school; but, as an eastern counties man (to one of whose plays, Friar Bacon, the Norfolk and Suffolk borderland owes a lasting poetic commemoration) he naturally found his way to Cambridge, where he entered St John's College as a sizar in 1575 and took his B.A. thence in 1579, proceeding M.A. in 1583 from Clare Hall. His life at the university was, according to his own account, spent "among wags as low as himself, with whom he consumed the flower of his youth." In 1588 he was incorporated at Oxford, so that on some of his title-pages he styles himself "uritusque Academiae in Artibus Magister"; and Nashe humorously refers to him as "uritusque Academiae Robertus Greene." Between the years 1578 and 1583 he had travelled abroad, according to his own account very extensively, visiting France, Germany, Poland and Denmark, besides learning at first-hand to "hate the pride of Italie" and to know the taste of that poet's fruit, "Spanish mirabilones." The grounds upon which it has been suggested that he took holy orders are quite insufficient; according to the title-page of a pamphlet published by him in 1583 he was then a "student inphisice." Already, however, after taking his M.A. degree, he had according to his own account begun his London life, and his earliest extant literary production was in hand as early as 1580. He now became "an author of plays and a penner of love-pamphlets, so that I soone grew famous in that qualitie, that who for that trade grewe so ordinary about London as Robin Greene?" "Glad was that printer," says Nashe, "that might bee so blest to pay him deare for the very dregs of his wit." By his own account he rapidly sank into the worst debaucheries of the town, though Nashe declares that he never knew him guilty of notorious crime. He was not without passing impulses towards a more righteous and sober life, and was derided in consequence by his associates as a "Puritane and Presizian." It is possible that he, as well as his bitter enemy, Gabriel Harvey, exaggerated the looseness of his conduct. His marriage, which took place in 1585 or 1586, failed to steady him; if Francesco, in Greene's pamphlet Never too late to mend (1590), is intended for the author himself, it had been a runaway match; but the fiction and the autobiographical sketch in the Reprisal agree in their account of the unfaithfulness which followed on the part of the husband. He lived with his wife, whose name seems to have been Dorothy ("Doll"); and cf. Dorothea in James IV.), for a while; "but forasmuch as she would persuade me from my wilful wickednes, after I had a child by her, I cast her off, having spent up the marriage-money which I obtained by her. Then left I her at six or seven, who went into Lincolnshire, and I to London," where his reputation as a playwright and writer of pamphlets of "love and vaine fantasyes" continued to increase, and where his life was a feverish alternation of labour and debauchery. In his last years he took it upon himself to make war on the cutpurses and "conny-catchers" with whom he came into contact in the slums, and whose doings he fearlessly exposed in his writings. He tells us how at last he was friendless except it were in a few alehouses," where he was respected on account of the score he had run up. When the end came he was a dependant on the charity of the poor and the pitying love of the unfortunate. Henri Murger has drawn no picture more sickening and more pitiful than the story of Greene's death, as told by his Puritan adversary, Gabriel Harvey—in a verse from unprefixed narrator. Greene had taken up the cudgels provided by the Harvey brothers on their intervention in the Marprelate controversy, and made an attack (immediately suppressed) upon Gabriel's father and family in the prose-tract A Quip for an Upstart Courtier, or a Quaint Dispute between Velvet Breeches and Cloth Breeches (1592). After a banquet where the chief guest had been Thomas Nashe—an old associate and a college friend of Greene's, any great intimacy with whom, however, he seems to have been anxious to disclaim—Greene had fallen sick of "a surfeit of pickle herring and Remondine." At the house of a poor tailor near Dowgate, deserted by all except his compassionate hostess (Mrs Isam) and two women—one of them the sister of a notorious thief named "Cutting Ball," and the mother of his illegitimate son, Fortuneus Greene—he died on the 3rd of September 1592. Shortly before his death he wrote under a bond for £10 which he had given to the good shoemaker, the following words addressed to his long-forsaken wife: "Doll, I charge thee, by the love of our youth and by my soules rest, that thou wilt see this man paid; for if hee and his wife had not suffocced me, I had died in the streets—Robert Greene."

Four Letters and Certain Sonnets, Harvey's attack on Greene,
appeared almost immediately after his death, as to the circumstances of which his relentless adversary had taken care to inform himself personally. Nashe took up the defence of his dead friend and ridiculed Harvey in *Strange News* (1593); and the dispute continued for some years. But, before this, the dramatist Henry Chettle published a pamphlet from the hand of the unhappy man, entitled *Greene's Groats-worth of Wit bought with a Million of Repentance* (1592), containing the story of Roberto, who may be regarded, for practical purposes, as representing Greene himself. This ill-starred production may almost be said to have done more to excite the resentment of posterity against Greene's name than all the errors for which his profession has repented. For Roberto contained three of his quondam acquaintances. Of these three Marlowe was one—to whom and to whose creation of "that Atheist Tamberlaine" he had repeatedly alluded. The second was Peele, the third probably Nashe. But the passage addressed to Peele contained a transparent allusion to a fourth dramatist, who was an actor likewise, as "an upstart crow beautified with our feathers, that with his Tygres heart wropt in a player's head suppose hee is as well able to bombast out a blank verse as the best of you; and being an absolute Johannes fac-totum, is in his owne conceptions the shewer of his playes to a country." The phrase italics observed a passage occurring in *The True Tragedie of Richard, Duke of York,* &c., and retained in Part III. of *Henry VI.* If Greene (as many eminent critics have thought) had a hand in *The True Tragedie,* he must here have intended a charge of plagiarism against Shakespeare. But while it seems more probable that (as the late R. Simpson suggested) the upstart crow beautified with the feathers of the three dramatists is a sneering description of the actor who declined their verse, the *animus* of the whole attack (as explained by Dr Ingeley) is revealed in its concluding phrase: The "shakes-scene," *i.e.* this actor had ventured to intrude upon the domain of the regular staff of playwrights—whose monopoly was in danger!

Two other prose pamphlets of an autobiographical nature were issued posthumously. Of these, *The Rependance of Robert Greene, Master of Arts* (1592), must originally have been written by him on his death-bed, under the influence, as he says, of Father Parsons's *Booke of Resolution* (*The Christian Directorie, appertaining to Resolution*, 1582, republished in an enlarged form, which became very popular, in 1585); but of having been improved, from the original; while Greene's *Vision* was certainly not, as the title-page avers, written during his last illness.

Altogether not less than thirty-five prose-tracts are ascribed to Greene's prolific pen. Nearly all of them are interspersed with verses; in their themes they range from the "misticall" wonders of the heavens to the familiar but "pernicious sleights" of the sharpers of London. But the most widely attractive of his prose publications were his "love-pamphlets," which brought upon him the outcry of Puritan censors. The earliest of his novels, as they may be called, *Mamillia,* was licensed in 1583.

This interesting story may be said to have accompanied Greene through life; for even part ii., of which, though probably completed several years earlier, the earliest extant edition bears the date 1593, had a sequel, *The Anatomie of Love's Flatteries,* which contains a review of suitors recalling Portia's in *The Merchant of Venice.* *The Myrour of Modestie* (the story of Susanna) (1584); *The Historie of Arrhato, King of Denmark* (1584); *Morando, the Triamaron of Love* (a rather tedious imitation of the *Decameron* (1584); *Plancemochius* (1585) (a contention in story-telling between Venus and Saturn); *Pendopeloe's Web* (1587) (another string of stories); *Alcida,* *Greene's Metamorphosis* (1588), and others, followed. In these popular productions he appears very distinctly as a follower of John Lyly; indeed, the first part of *Mamillia* was entered in the Stationers' Registers in the year of the appearance of *Euphues,* and two of Greene's novels are by their titles announced as a kind of sequel to the parent romance: *Euphues his Censour to Philanthus* (1587), *Menaphon.* *Camilla's Alarum to Slumbering Euphues* (1586), named in some later editions Greene's *Arcadia.* This pastoral romance, written in direct emulation of Sidney's, with a heroine called Samilla, contains St Sephista's charming lullaby, with its refrain "Father's sorrow, father's joy." But, though Greene's style copies the balanced oscillation, and his diction the ornateness (including the proverbial philosophy) of Lyly, he contrives to interest by the matter as well as to attract attention by the manner of his narratives. Of his highly moral intentions he leaves the reader in no doubt, since they are exposed on the title-pages. The full title of *The Myrour of Modestie* for instance contains: "wherein appeareth as in a perfect glasse how the Lord delivereth the innocent from all imminent perils, and provideth the blood-thirsty hypocrites with deserved punishments," &c. On his *Pandosto, The Triumph of Time* (1588) Shakespeare founded *A Winter's Tale;* in fact, the novel contains the entire plot of the comedy, except the device of the living statue; though some of the subordinate characters in the play, including Autolycus, were added by Shakespeare, together with the pastoral fragrance of one of its episodes.

In Greene's *Never too Late* (1590), announced as a "Powder of Experience: sent to all youthfull gentlemen" for their benefit, the hero, Francesco, is in all probability intended for Greene himself, though as his own creature, the "shakes-scene," *i.e.* this actor had ventured to intrude upon the domain of the regular staff of playwrights—whose monopoly was in danger!

This episodical narrative has a vivacity and truthfulness of manner which savour of an 18th century novel rather than of an Elizabethan tale concerning the days of "Palmerin, King of Great Britain." Philador, the prodigal of *The Mourning Garment* (1590), is obviously also in some respects a portrait of the writer. The experiences of the Roberto of Greene's *Groats'-worth of Wit* (1592) are even more palpably the experiences of the author himself, though they are possibly overdrawn—for a born rhetorician exaggerates everything, even his own sins. Besides these and the posthumous pamphlets on his repentance, Greene left realistic pictures of the very desirable company society to which he finally descended, in his pamphlets on "conny-catching": *A Notable Discoverie of Coosnag* (1591), *The Blacke Bookes Messenger.* *Laying open the Life and Death of Ned Browne,* one of the most Notable Cutpurses, Crossitters, and Conny-catchers that ever lived in England (1592). Much in Greene's manner, both in his romances and in his pictures of low life, anticipated what proved the slow course of the actual development of the English novel; and it is probable that this trochanter, and the which best suited the bright fancy, ingenuity and wit of which genius was surrounded, was not the least spinning and story-telling rather than dramatic composition. It should be added, euphuist as Greene was, few of his contemporaries in their lyrics warbled wood-notes which like his resemble Shakespeare's in their native freshness.

Curiously enough, as Mr Churton Collins has pointed out, Greene, except in the two pamphlets written just before his death, never refers to his having written plays; and before 1592 his contemporaries are equally silent as to his labours as a playwright. Only four plays remain to us of which he was indisputably the sole author. The earliest of these seems to have been the *Comical History of Alphonson, King of Arragon,* of which Henslowe's *Diary* contains no trace. But it can hardly have been first acted long after the production of Marlowe's *Tamurulaine,* which had, in all probability, been brought on the stage in 1587. For this play, "comical" only in the negative sense of having a happy ending, was manifestly written in emulation as well as in direct imitation of Marlowe's tragedy. While Greene cannot have thought himself capable of surpassing Marlowe as a tragic poet, he very probably wished to outdo him in "business," and to equal him in the rant which was sure to bring down at least part of the house. *Alphonson* is a "history proper—a dramatized chronicle or narrative of warlike events. Its fame could never equal that of Marlowe's tragedy; but its composition showed that Greene could seek to rival the most popular drama of the day, without falling very far short of his model.

In the *Honourable History of Friar Bacon and Friar Bungay* (not known to have been acted before February, 1592, but probably written in 1589) Greene once more attempted to emulate
Marlowe; and he succeeded in producing a masterpiece of his own. Marlowe's Doctor Faustus, which doubtless suggested the composition of Greene's comedy, reveals the mighty tragic genius of its author; but Greene resolved on an altogether different treatment of a cognate theme. Interweaving with the popular tale of Friar Bacon and his wondrous doings a charming idyl (so far as we know, of his own invention), the story of Prince Edward's love for the Fair Maid of Fressingfield, he produced a comedy brimful of amusing action and genial fun. Friar Bacon remains a dramatic picture of English Elizabethan life with which The Merry Wives alone can compare. Nor even ultra-classicism in the similes of its diction can destroy the naturalness which characterizes its perennial charm. The History of Orlando Furioso, one of the Twelve Peeres of France has on unsatisfactory evidence been dated as before 1586, and is known to have been acted on the 21st of February 1592. It is a free dramatic adaptation of Ariosto, Harington's translation of whom appeared in 1591, and who in one passage is textually quoted; and it contains a large variety of characters and a superabundance of action. Fairly lucid in arrangement and fluent in style, the treatment of the madness of Orlando lacks tragic power. Very few dramatists from Sophocles to Shakespeare have succeeded in subordinating the grotesque effect of madness to the tragic; and Greene is not to be included in the list.

In The Scottish Historie of James IV. (acted 1592, licensed for publication 1594) Greene seems to have reached the climax of his dramatic powers. The "historical" character of this play is pure pretence. The story is taken from one of Giraldi Cinthio's tales. Its theme is the illusory passion of King James for the chaste lady Ida, to obtain whose hand he endeavoured the suggestion of a villain called Ateukin, to make away with his own wife. She escapes in doublet and hose, attended by her faithful dwarf; but, on her father's making war upon her husband to avenge her wrongs, she brings about a reconciliation between them. Not only is this well-constructed story effectively worked out, but the characters are vigorously drawn, and in Ateukin there is a touch of Iago. The fooling by Slipper, the clown of the piece, is unexceptionable; and, lest even so the play should hang heavy on the audience, its action is carried off by a pleasant comedie "—i.e. a prelude and some dances between the acts—"presented by Oboram, King of Fayeries," who is, however, a very different person from the Oberon of A Midsummer Night's Dream.

George-a-Greene the Pinner of Wakefield (acted 1593, printed 1599), a delightful picture of English life fully worthy of the author of Friar Bungay, has been attributed to him; but the external evidence is very slight, and the internal unconvincing. Of the comedy of Fair Enu, which resembles Friar Bacon in more than one point, Greene cannot have been the author; the question as to the priority between the two plays is not so easily solved. The conjecture as to his supposed share in the plays on which the second and third parts of Henry VI. are founded has been already referred to. He was certainly joint author with Thomas Lodge of the curious drama called A Looking Glass for London and England (acted in 1592 and printed in 1594)—a dramatic apologue conveying to the living generation of Englishmen the warning of Nineveh's corruption and prophesied doom. The lesson was frequently repeated in the streets of London by the "Ninevithical motions" of the puppets; but there are both fire and wealth of language in Greene and Lodge's oratory. The comic element is not absent, being supplied in abundance by Adam, the clown of the piece, who belongs to the family of Slipper, and of Friar Bacon's servant, Miles.

Greene's dramatic genius has nothing in it of the intensity of Marlowe's tragic muse; nor perhaps does he ever equal Peele at his best. On the other hand, his dramatic poetry is occasionally animated with the breezy freshness which no artifice can simulate. He had considerable constructive skill, but he has created no character of commanding power—unless Ateukin is excepted; but his personages are living men and women, and marked out from one another with a vigorous but far from rude hand. His comic humour is undeniably his, and he had the gift of light and graceful dialogue. His diction is overloaded with classical ornament, but his versification is easy and fluent, and its cadence is at times singularly sweet. He creates his best effects by the simplest means; and he is indisputably one of the most attractive of early English dramatic authors.

Greene's dramatic works and poems were edited by Alexander Dyce in 1831 with a life of the author. This edition was reissued in 1870. His complete works were edited by Dr. Huth Library by A. B. Grosart. This issue (1881-1886) contains a translation of Nicholas Storojenko's monograph on Greene (Moscow, 1878). Greene's plays and poems were edited with introductions, and notes by J. Churton Collins in 2 vols. (Oxford, 1905); the general introduction to this edition has superseded previous accounts of Greene and his dramatic and lyrical writings. An account of his life, which is to be completed by J. J. Jenkins, will appear in The Time of Shakespeare (Eng. trans., 1906). See also W. Bernhardi, Robert Greene's Leben und Schriften (1874); F. M. Bodenstedt, in Shakespeare's Zeitgenossen und ihre Werke (1858); and an introduction by W. Ward to Friar Bacon and Friar Bungay, 1886, 4th ed., 1901.

GREENFIELD, a township and the county-seat of Franklin county, in N.E. Massachusetts, U.S.A., including an area of 20 sq. m. of meadow and hill country, watered by the Green and Deerfield rivers and various small tributaries. Pop. (1890) 5252, (1900) 7927, of whom 1451 were foreign-born; (1910 census) 10,427. The principal village, of the same name as the township, is situated on the N. bank of the Deerfield river, and on the Boston & Maine railway and the Connecticut Valley street railway (electric). Among Greenfield's manufactures are cutlery, machinery, and taps and dies. Greenfield, originally part of Deerfield, was settled about 1682, was established as a "district" in 1753, and on the 23rd of August 1775 was, by a general Act, separated from Deerfield and incorporated as a separate township, although it had assumed full township rights in 1774 by sending delegates to the Provincial Congress. In 1793 part of it was taken to form the township of Gill; in 1838 part of it was annexed to Bernardston; and in 1866 it annexed a part of Deerfield. It was not disaffected at the time of Shay's Rebellion.

GREENFINCH, or Green Linnet, as it is very often called, a common European bird, the Fringilla chloris of Linnaeus, ranked by many systematists with one section of haw-fiches, Coccothraustes, but apparently more nearly allied to the other section Hesperiphana, and perhaps justifiably deemed the type of a distinct genus, to which the name Chloris or Ligurinus has been applied. The cock, in its plumage of yellowish-green and yellow is one of the most finely coloured of common English birds, but he is rather heavily built, and his song is hardly commodined. The hen is much less brightly tinted. Throughout Britain, as a rule, this species is one of the most plentiful birds, and is found at all seasons of the year. It pervades almost the whole of Europe, and in Asia reaches the river Ob. It visits Palestine, but is unknown in Egypt. It is, however, abundant in Mauritania, whence specimens are so brightly coloured that they have been deemed to form a distinct species, the Ligurinus aurantiventris of Dr Cabanis, but that view is now generally abandoned. In the north-east of Asia and its adjacent islands occur two allied species—the Fringilla sinica of Linnaeus and the F. casarohaib of Temminck.

GREENHEART, one of the most valuable of timbers, the produce of Nectandra rodiei, natural order Lauraceae, a large tree, native of tropical South America and the West Indies. The Indian name of the tree is sipiri or biuru, and from its bark and fruits is obtained the febrifuge principle bibirine. Greenheart wood is of a dark-green colour, sap wood and heart wood being so much alike that they can with difficulty be distinguished from each other. The heart wood is one of the most durable of all timbers, and its value is greatly enhanced by the fact that it is proof against the ravages of many marine borers which rapidly destroy pines and other submarine structures of most other kinds of wood available for such purposes. In the Kelvingrove Museum, Glasgow, there are two pieces of planking from a wreck submerged during eighteen years on the west coast of Scotland.
The one specimen—greenheart—is merely slightly pitted on the surface, the body of the wood being perfectly sound and untainted, while the other—teak—is almost entirely eaten away. Greenheart, tested either by transverse or by tensile strain, is one of the strongest of all woods, and it is also exceedingly dense, its specific gravity being about 1.150. It is included in the second line of Lloyd’s Register for shipbuilding purposes, and it is extensively used for keelsons, beams, engine-bearers and planking, &c., as well as in the general engineering arts, but its excessive weight unfit it for many purposes for which its other properties would render it eminently suitable.

GREENLAND (Danish, Grønland), a large continental island, the greater part of which is within the Arctic Circle, while the whole is arctic in character. It is not connected with any portion of Europe or America except by suboceanic ridges; but in the extreme north it is separated only by a narrow strait from Ellesmere Land in the archipelago of the American continent. It is bounded on the east by the North Atlantic, the Norwegian and Greenland Seas—Jan Mayen, Iceland, the Faeroe Islands and the Shetlands being the only lands between it and Norway. Denmark Strait is the sea between it and Iceland, and the northern Norwegian Sea or Greenland Sea separates it from Spitsbergen. On the west Davis Strait and Baffin Bay separate it from Baffin Island. The so-called bay name is no longer used after the strait successively known as Smith Sound, Kane Basin, Kennedy Channel and Robeson Channel. A submarine ridge, about 300 fathoms deep at its deepest, unites Greenland with Iceland (across Denmark Strait), the Faeroes and Scotland. A similar submarine ridge unites it with the Cumberland Peninsula of Baffin Land, across Davis Strait. Two large islands (with others smaller) lie probably off the north coast, being apparently divided from it by very narrow channels which are not yet explored. If they be reckoned as integral parts of Greenland, then the north coast, fronting the polar sea, culminates about 83° 40’ N. Cape Farewell, the most southerly point (also on a small island), is in 59° 45’ N. The extreme length of Greenland may therefore be set down at about 1650 m., while its extreme breadth, which occurs about 77° 30’ N., is approximately 800 m. The area is estimated at 287,275 sq. m. Greenland is a Danish colony, inasmuch as the west coast and also the southern east coast belong to the Danish crown. The scattered settlements of Europeans on the southern parts of the coasts are Danish, and the trade is a monopoly of the Danish government.

The southern and south-western coasts have been known, as will be mentioned later, since the 10th century, when Norse settlers appeared there, and the names of many famous arctic explorers have been associated with the exploration of Greenland. The communication between the Norse settlements in Greenland and the motherland Norway was broken off at the end of the 14th and the beginning of the 15th century, and the Norsemen’s knowledge about their distant colony was gradually more or less forgotten. The south and west coast of Greenland was then re-discovered by John Davis in July 1565, though previous explorers, as Cortereal, Froebisher and others, had seen it, and at the end of the 16th and the beginning of the 17th century the work of Davis (1586–1588), Hudson (1610) and Baffin (1616) in the western seas afforded some knowledge of the west coast. This was added to by later explorers and by whalers and sealers. Among explorers who in the 19th century were specially connected with the north-west coast may be mentioned E. A. Inglefield (1852) who sailed into Smith’s Sound,3 Elisha Kent Kane (1853–1855)4 who worked northward through Smith Sound into Kane Basin and through Baffin Bay, and Francis Hall (1871) who explored the strait (Kennedy Channel and Robeson Channel) to the north of this.5 The northern east coast was sighted by Hudson (1607) in about 73° 30’ N. (C. Hold with Hope), and during the 17th century and later this northern coast was probably visited by many Dutch whalers. The first who gave more accurate information was the Scottish whaler, Scoresby, jun. (1823) who, with his father, explored the coast between 60° and 75° N., and gave the first fairly trustworthy map of it.6 Captains Edward Sabine and Clavering (1823) visited the coast between 72° 5’ and 75° 12’ N. and met the only Eskimo ever seen in this part of Greenland. The second German polar expedition in 1870, under Carl Christian Koldeway7 (1837–1908), reached 77° 7’ N. (Cape Bismark); and the duke of Orleans, in 1905, ascertained that this point was on an island (the Dove Bay of the German expedition being in reality a strait) and penetrated farther north, to about 80° N. From this point the north-east coast remained unexplored, though a sight was reported in 1760 by a whaler named Lambert, and again in 1775 as far north as 79° by Daines Barrington, until a Danish expedition under Mylius Eriksen in 1906–1908 explored it, discovering North-East Frelond, the easternmost point (see Polar Regions and map). The southern part of the east coast was first explored by the Dane Wilhelm August Graah (1839–1830) between Cape Farewell and 65° 16’ N.8 In 1838–1838 the Danes G. Holm and T. V. Garde carefully explored and mapped the coast from Cape Farewell to Cape R. F. E. E. Nyman, in the “Sophia” (1839–1838), 9 explored the western part of this coast and travelled along a part of this coast in 1888.10 A. E. Nordenskiöld, in the “Sophia,” landed near Angmagssalik, in 65° 36’ N., in 1883.11 Captain C. Ryder, in 1891–1892, explored and mapped the large Scoresby Sound, or, more correctly, Scoresby Fjord.12 Lieutenant G. Amdrup, in 1899, explored the coast from Angmagssalik north to 67° 22’ N.13 A part of this coast, about 65° N., had also been seen by Nansen in 1885.14 In 1899 Professor A. G. Nathorst explored the land between Franz Josef Fjord and Scoresby Fjord, where the large King Oscar Fjord, connecting Davis’s Sound with Franz Joseph Fjord, was discovered.15 In 1899 Lieutenant Amdrup explored the still unknown east coast from 69° 10’ N. south to 67° N.16 From the work of explorers in the north-west it had been possible to infer the approximate latitude of the northward termination of Greenland long before it was definitely known. Towards the close of the 19th century several explorers gave attention to this question. Lieutenant (afterwards Admiral) L. A. Beaumont (1876), of the Nares Expedition, explored the coast north-east of Robeson Channel to 82° 20’ N.17 In 1882-1883 Lockwood and Sergeant (afterwards Captain) D. L. Brainard, of the U.S. Exploration Expedition, reached the Baffin Bay,18 explored the north-west coast beyond Beaumont’s farthest to a promontory in 83° 42’ 46” N. and 46° 46’ E. and they saw to the north-east Cape Washington, in about 83° 38’ N. and 30° 30’ E., the most northerly point of land till then observed. In July 1892 R. E. Peary and E. Austrup, crossing land by Inglefield Gulf, Smith Sound, discovered Independence Bay on the north-east coast in 81° 37’ N. and 34° 15’ W.19 In May 1893 it Journal of a Voyage to the Northern Whale Fishery (1893).

was revisited by Peary, who supposed this bay to be a sound communicating with Victoria Inlet on the north-west coast. To the north Heilprin Land and Melville Land were seen stretching northwards, but the probability seemed to be that the coast soon trended north-west. In 1901 Peary rounded the north point, and penetrated as far north as 83° 50' N. The scanty exploration of

from the western margin, in 62° 50' N. Nordskjöld penetrated in 1883 about 70 m. inland in 68° 20' N., and two Lapps of his expedition went still farther on skis, to a point nearly under 45° W. at an elevation of 6600 ft. Peary and Maigaard reached in 1886 about 300 m. inland, a height of 7500 ft. in 69° 30' N. Nansen with five companions in 1888 made the first complete crossing of the inland ice; working from the east to the west, about 64° 25' N., and reached a height of 8922 ft. Peary and Austrup, as already indicated, crossed in 1892 the northern part of the inland ice between 78° and 83° N., reaching a height of about 8000 ft., and determined the northern termination of the ice-covering. Peary made very nearly the same journey again in 1895. Captain T. V. Garde explored in 1893 the interior of the inland ice between 61° and 62° N. near its southern termination, and he reached a height of 7080 ft. about 60 m. from the margin.

Coasts.—The coasts of Greenland are for the most part deeply indented with fjords being intensely glaciated. The coast-line of Melville Bay (the northern part of the west coast) is to some degree an exception, though the fjords may here be somewhat filled with glaciers, and, for another example, it may be noted that Peary observed a marked contrast on the north coast. Eastward as far as Cape Morris Jesup there are pointed headlands and islands, as elsewhere, with deep water close inshore. East of the same cape there is an abrupt change; the coast is unbroken, the mountains recede inland, and there is shallow-water for a considerable distance from the coast. Numerous islands lie off the coasts where they are indented, but these are in no case large, excepting those off the north coast, and that of Disco off the west, which is crossed by the parallel of 70° N. This island, which is separated by Wapitat Strait from the Ungwal peninsula, is lofty, and has an area of 3005 sq. m. Steenstrup in 1898 discovered in it the warmest spring known in Greenland, having a temperature of 66° F. The unusual glaciation of the east coast is evidently owing to the north polar current carrying the ice masses from the north polar basin south-westward along the land, and giving it an entirely arctic climate down to Cape Farewell. In some parts the interior ice-covering extends down to the outer coast, while in other parts its margin is situated more inland, and the entire coast-land is deeply intersected by fjords extending far into the interior, where they are blocked by enormous glaciers or "ice-currents" from the interior flowing down which discharge masses of icebergs into them. The east coast of Greenland is in this respect highly interesting. All coasts in the world which are much intersected by deep fjords have, with very few exceptions, a western exposure, e.g. Norway, Scotland, British Columbia and Alaska, Patagonia and Chile, and even Spitsbergen and Novaya Zemlya, whose west coasts are far more indented than their east ones. Greenland forms the most prominent exception, its eastern coast being quite as much indented as its western. The reason is to be found in its geographical position, a cold ice-covered polar current running south along the land, while not far out there is an open warmer sea, a circumstance which, while producing a cold climate, must also give rise to much precipitation, the land being thus exposed to the alternate erosion of a rough atmosphere and large glaciers. On the east coast of Baffin Land and Labrador there are similar conditions. The result is that the east coast of Greenland has the largest system of typical fjords known on the earth's surface. Scoresby Fjord has its source about 180 m. from the outer coast to the point where it is blocked by the glaciers, and with its numerous branches covers an enormous area. Franz Josef Fjord, with its branch King Oscar Fjord, communicating with Davy's Sound, forms a system of a very similar scale. These fjords are very deep; the greatest depth

[2] Ibid., part xvi. (Copenhagen, 1896).
GREENLAND

found by Ryder in Scoresby Sound was 300 fathoms, but there are certainly still greater depths; like the Norwegian fjords they have, however, the same characteristics as those which characterize fjords between land and water, near their mouths. A few soundings made outside this coast seem to indicate that the fjords continue as deep submarine valleys far out to sea, just as the coast fjords do in the north of Sound. One of the best known from earlier days is the great Godthaab Fjord (or Baals Revier) north of 64° N. Along the east coast there are many high mountains, exceeding 6000 and 7000 feet, and forming a long high ridge north of the inner part of Tinggaertok, on the Lindenof Fjord, in 60° 35' N., which is 7340 ft. high. At the bottom of Mogens Heinesen Fjord, 62° 30' N., the peaks are 6300 ft. high.

At Unvik, where Nansen began his journey across the inland ice, the highest peak projecting through the ice-covering was Gæmel's Nunatak, 6420 ft., in 61° 34' N. In the region of Isortoq Fjord, on the eastern coast, which is 155 miles north to 6500 ft., the most prominent peak being Ingolf's Fjeld, in 66° 20' N., about 6000 ft., which is seen far out at sea, and forms an excellent landmark. This is probably the Blaaker (i.e. Blue Star or blue shirt) of the old Norwegians, their first landmark on their way from Iceland to the Oster Bygd, the present Julianaehab district, on the south-west coast of Greenland. A little farther north the coast is much lower, rising only to heights of 2000 ft., and just north of 67° 10' N. only to 500 ft. or less. The highest mountains near the inner branches of Scoresby Fjord are 7000 ft. The Petersmann Spitze, near the shore of Franz Josef Fjord, 65° 58' N., and far inland, was at one time considered to be the highest mountain in Greenland, but according to Natherst it is "probably only two-thirds as high as Payer supposed."4

The coast of Greenland the mountains are generally not so high, but even here peaks of 5000 and 6000 ft. are not uncommon. As a whole the coasts are unusually mountainous, and Greenland is probably, if not the highest, at least the second highest country in the world. There is no other known land of such a size so filled along its coasts on all sides with high mountains and deep fjords and valleys.

The Inland Ice. — The whole interior of Greenland is completely covered by the so-called inland ice, an enormous glacier forming a regular shield-shaped expanse of snow and glacier ice, and burying all valleys and mountains far below its surface. Its area is about 715,000 sq. miles. Of far the greatest part of the inner free from the sea. Its surface is marked by smaller snow-covered basins, or fiords, which are gradually filled with ice, so that the island, which is of an irregular form, is divided into as many as 250 or more larger and smaller ice-masses. The largest of these are the Jakobshavn, the largest of these two, and the Inland Ice of Greenland is situated about latitude 80°. It is divided into a great number of smaller segments, the largest of which is the inner part of the Inland Ice of the inner part of Scoresby Fjord, on the east coast, was 240 ft. above sea-level. There is a common belief that during quite recent times the west and southern coasts within the Danish possessions, has been sinking. Although there are many indications which may make this probable, none of them can be said to be quite decisive.5

[Geology.—So far as made out, the structure of exposed Greenland is as follows:—

1. Lawrentian gneiss forms the greatest mass of the exposed rocks of the country bare of ice. They are found on both sides of Smith Sound, rising to a height of 2000 feet, and on the mountain range between Dow Island, Noursktoft Peninsula and the

11 Ibid. part i. p. 175 (1896).

Olites of Pendulum Island in East Greenland. Ancient schists occur on the east coast south of Angmagssalik, and basalts and schists are found in Smyrnes Fjord. It is probable that these rocks, though not identical, have been derived from the same source as those of the Harang Peninsula, but it is doubtful whether the rocks so designated by the “Alert” and “Discovery” expedition are really the rocks so known in Canada, or are even identical with those of Canada.

3. Devonian rocks are believed to occur in Igalsik and Tunnu- diorvik Fjords, in S.W. Greenland, but are not fossiliferous sandstone, rapidly disintegrating, this cannot be known. It is, however, believed that the same rock is found to Smiianarvorsuaq, near Dana Bay, Captain Fjeldman found a species of Spiriferoida and Proctodactylaus or costatus, though it is possible that these fossils represent the “Ura stage” (Herz) of the Lower Carboniferous. A few Devonian fossils have also been recorded from the Parry Archipelago, and Nathorst has shown the existence of Old Red Sandstone facies of Devonian in Trinil Island, Geographical Society Island, Ymer Island and Cooe Peninsula.

4. Carboniferous.—In erratic blocks of sandstone, found on the Disco shore of the Waigat have been detected a Sigillaria and a species of Pecopteris or Glenackina, perhaps of this age; and proof to this conclusion has been given and therefore, in all likelihood, the opposite Greenland shore, contains a clearly developed Carboniferous Limestone fauna, identical with that of the native island of the same continent, and referable also to British and Spitsbergen species. Of the Coal Measures above these, if they occur, we know nothing at present.

5. Jurassic.—These do not occur on the west coast, but on the east coast the German expedition discovered marls and sandstones on Kuhl Island, resembling those of the Russian Jurassic, characterized by the presence of the genus Aucella, Okostephanus Peyeri, O. striatari, Bemsmastum Pandeterian, B. velgensi, B. abcutus, and B. mollis. The Jurassic beds have been described either as the species of the genus of Greenland, yet it was observed that a continuation of the direction of the known strike of the limestones of Kuhl Peninsula, carried over the eastern land, would bring us to a country, where the formation occurs, and contains certain species identical with those of the Grunell Land rocks of this horizon. The facies of the fossils is, according to Mr Etheridge, North American and Canadian, and it may, perhaps, be distantly identical with the northern or eastern part of Spitsbergen. There has been some doubt, however, in several respects to be unlike the celebrated large nodule of iron found by Nordenskiöld at Ovifik, but appears to resemble much more closely the softer kind of iron nodules found by Steenstrup in the Baltic; it is seen exposure to the air equally well, and has similar Widmannstätten figures very sharp, as is to be expected in such a large mass. It contains, however, more nickel and also phosphorus. A few other nodules may be noticed, and some have been worked to a small extent—graphite is abundant, particularly near Upernavik; erystolite is found almost exclusively at Iviagut; copper has been observed at several places, but only in nodules and not as metallic crystals of pure copper. At various districts about Disco Bay and Umanak Fjord, Steatite or soapstone has long been used by the natives for the manufacture of lamps and vessels.

Climate.—The climate is very uncertain, the weather changing suddenly from bright sunshine (when mosquito often swarm) to dense fog or heavy falls of snow and icy winds. At Julianeab in July there are days like arctic, though it is summer of Norway and Sweden in the same locality; but its mean temperature for the whole year probably approximates to that on the Norwegian coast 600 m. farther north. The climate of the interior has been found to be of a continental character, with a long duration of temperature, and with an almost permanent anti-cyclonic region over the interior of the inland ice, from which the prevailing winds radiate towards the coasts. On the 64th parallel the mean annual temperature at an elevation of 650 ft. is supposed to be −3° F., or reduced to sea-level 5° F. The mean annual temperature in the interior farther north is supposed to be −10° F. reduced to sea-level. Prevailing winds during summer and autumn are often warm, with a temperature of 50° F., and the winter months July, in the interior of the northern latitudes, should be, reduced to sea-level, on the 64th parallel 32° F., and that of the coldest month, January, about −22° F. while in North Greenland is probably around −40° reduced to sea-level. Here we may note that the coldest months of the northern latitudes are January and February. The interior of Greenland contains both summer and winter a pole of cold, situated in the opposite longitude to that of Siberia, with which it is able to compete in extreme severity. On Nansen's expeditions temperatures of about −49° F. were experienced during

5. See Peary, Northward over the “Great Ice,” ii. 604 et seq. (New York, 1898).

The nights in the beginning of September, and the minimum during the winter may probably sink to 90° F. in the interior of the inland ice. These low temperatures are evidently caused by the radiation of heat from the snow-covered surface of the ice in the interior. The highest temperatures of temperature is therefore very rarely exceeded in high latitudes, sometimes amounting to 40°. Such a range is elsewhere found only in deserts, but the surface of the inland ice may be considered to be approximately as an average from the land and sea; the interior is in the whole considerably more arctic than that of the west coast on corresponding latitudes; the land is much more completely snow-covered, and the snow-lie goes considerably lower. The probability and frequency of precipitation shows a corresponding decrease. The cyclonic winds passing either over mountains or down the outer slope of the inland ice. Mirage and similar phenomena and the aurora are common.

Nearby—It was long a common belief that the fauna and flora of Greenland were essentially European, a circumstance which would make it probable that Greenland has been separated from Europe during a long period of time from Europe. The correctness of this hypothesis may, however, be doubted. The land mammals of Greenland are decidedly more American than European; the musk-ox, the banded lemming (Dicrostonyx), the large white polar bear and white foxes, have all been an invasion recently round the northern part of the country to the east coast, the Eskimo and the dog—probably the reindeer—have all come from America, while the other land mammals are either of the same origin. The American beach pea (Mustela erminea), are perfectly circumpolar forms. The species of seals and whales are, if anything, more American than European, and the same is the case with the black guillemot (Cystophora cristata), for instance, may be said to be a Greenland-American species, while a Scandinavian species, such as the grey seal (Halichoerus grypus), appears to be very rare both in Greenland and America. Of the sixty-one species of birds breeding in Greenland, eight are European-Asiatic, four are American, and the rest circumpolar or North Atlantic and North Pacific in their distribution. Of the sixty-one species of vessels, a greater number are of, which 40 are American, 14 European-Asiatic, and 5 European, five endemic, and the rest common both to America and Asia. We thus see that the American and the European-Asiatic elements predominate, while the European and Asiatic are in the interior of the country.

In the south, the condition is different. Here, the arctic species of plants, the wild pigs, and a great number of the American animals are indigenous. The sea-birds, the guillemot and the eider, have not penetrated this far. But the American beaver has been driven back, and the skunks and the American mink are rare. The Iceland mink, on the other hand, is common. The arctic plants, such as the low growing meadowsweet (Pedicularis bidentata), and the tundra, are common in the south, while in the interior they are rare. The Eskimos have been driven back from the interior, and the only native who can be found there is the Inuit. The European influence has been very strong in the south, and the Inuit has been driven back. The European influence has been very strong in the south, and the Inuit has been driven back. The European influence has been very strong in the south, and the Inuit has been driven back.
control. The municipal council has the disposal of 20% of the annual profits made on produce purchased within the confines of each district. It holds two sessions every year, and the discussions are entirely in the Eskimo language. In addition to their functions as guardians of the poor, the parish members have to investigate crimes and punish misdemeanours, settle litigations and divide inheritances. They can impose fines for small thefts or not sending before the inspector, and, in cases of high misdemeanour, have the power of inflicting corporal punishment.

A Danish coloni in Greenland might seem to many not to be a cheerful place at best; though in the long summer days they would certainly find some of those on the southern fjords comparatively pleasant. The fact is, however, that most people who ever lived some time in Greenland always long to go back. There are generally in a coloni three or four Danish houses, built of wood and pitched over, in addition to storehouses and a blubber-boiling establishment. The Danish residents may include, besides a coloni-betsterer and his assistant, a missionair or clergyman, at a few places also a doctor, and perhaps a carpenter and a schoolmaster. In addition there are generally from twenty to several hundred Eskimo, who live in huts built of stone and turf, each entered by a short tunnel. Lately their houses in the colonis have also to some extent been built of imported wood. Following the west coast northward, the trading centres are these: in the south inspectorate, Juliane-haab, near which are remains of the early Norse settlements of Eystri-ber and his inscriptions; (Eystri-ber) and Godthaab, in which district are the cryolite mines of Ivigtut; Godthaab, the principal settlement of all, in the neighbourhood of which are also early Norse remains (the Vester-Buqj); Sukkerfonnen, a most picturesque locality; and Holstenborg. In the north inspectorate the centres are: Egedesminde, on an istlet at the mouth of Disco Bay; Christianshao, one of the pleasantest settlements in the north, and Jacobshavn, on the inner shores of the same bay; Godhavn (or Livelye) on the south coast of Disco Island, formerly an important seat of the whaling industry; Rittenbyrk, Umanak, and, most northerly of all, Upernavik. On the east coast there is but one coloni, Angmagssalik, in 65° 30' N., only established in 1894. For ecclesiastical purposes Danish Greenland is reckoned in the province of the bishop of Zealand. The Danish mission in Greenland has a yearly grant of £2000 from the trading revenue of the colony, besides a contribution of £880 from the state. The Moravian mission, which had worked in Greenland for a century and a half, retired from the country in 1900. The trade of Greenland has on the whole much decreased in modern times, and trading and missions cost the Danish authorities about £11,000 every year, although this is partly covered by the income from the royalty of the cryolite mines at Ivigtut. There is, however, a yearly deficiency of more than £6000. The decline in the value of the trade, which was formerly very profitable, has to a great extent been brought about by the fall in the price of seal-oil. It might be expected that there should be a decrease in the Greenland seal fisheries, caused by the European and American sealers catching larger quantities every year, especially along the coasts of Newfoundlad and Labrador, and so actually diminishing the stock. Many of the natives of South Greenland, however, do not seem to demonstrate any such decrease. The average number of seals killed annually is about 33,000.1 The annual value of imports, consisting of manufactured goods, foodstuffs, &c., may be taken somewhat to exceed £40,000. The chief articles of export (together with those that have lapsed) have been already indicated; but they may be summarized as including seal-oil, seal, fox, bird and bear skins, fish products and eiderdown, with some quantity of worked stomach, walrus tusks and walrus hides, which in the days of the old Norse settlements were the chief articles of export, are now of little importance.

Population.—The area of the entire Danish colony is estimated at 45,000 sq. m., and its population in 1901 was 11,893. The Europeans number about 300. The Eskimo population of Danish Greenland (west coast) seems to have decreased since the middle of the 18th century. Hans Egede estimated the population then at 30,000, but this is probably a large over-estimate. The decrease may chiefly have been due to infectious diseases; a very severe epidemic of small-pox. During the last half of the 19th century there was on the whole a slight increase of the native population. The population fluctuates a good deal, owing, to some extent, to an immigration of natives from the east to the west coast. The population of the east coast seems on the whole to be decreasing in number, several hundreds chiefly living at Angmagssalik. In the north part of the east coast, in the region of Scoresby Fjord and Franz Josef Fjord, numerous ruins of Eskimo settlements are found, and in 1825 Clavering met Eskimo there, but now they have either completely died out or have wandered south. A little tribe of Eskimo has also been found in the region of Cape York near Smith Sound, the so-called “Arctic Highlanders” or Smith Sound Eskimo—number about 240.

History.—In the beginning of the 10th century the Norwegian Gonnbjorn, son of Ulf Kraka, is reported to have found some islands to the west of Iceland, and he may have seen, without landing upon it, the southern part of the east coast of Greenland. In 982 the Norwegian Eric the Red sailed from Iceland to find the land which Gonnbjorn had seen, and he spent three years on its south-western coasts exploring the country. On his return to Iceland in 985 he called the land Greenland in order to make people more willing to go there, and reported so favourably on its possibilities that he had no difficulty in obtaining followers. In 986 he started again from Iceland with 25 ships, but only 14 of them reached Greenland, where a colony was founded on the south-west coast, in the present Julianehaab district. Eric built his house at Brattalid, near the inner end of the fjord Tunugdliarlik, just north of the present Julianehaab. Other settlers followed and in a few years two colonies had been formed, one called Osterbyg in the present district of Julianehaab and the other a little farther north on the west coast in the present district of Godthaab, comprising later about 90 farms. Numerous ruins in the various fjords of these two districts indicate now where those colonies were. Wooden coffins, with skeletons wrapped in coarse hairy cloth, and both pagan and Christian tombstones with runic inscriptions have been found. On a voyage from Norway to Greenland Leif Ericsson (son of Eric the Red) discovered America in the year 1000, and a few years later Torliff Karlsen sailed with three ships and about 150 men, from Greenland to North Scotia to form a colony, but returned three years later (see Vinland).

When the Norsemen came to Greenland they found various remains indicating, as the old sagas say, that there had been people of a similar kind as those they met with in Vinland, in America, whom they called Skraeling (the meaning of the word is uncertain, it means possibly weak people); but the sagas do not report that they actually met the natives then. But somewhat later they have probably met with the Eskimo farther north on the west coast in the neighbourhood of Disco Bay, where the Norsemen went to catch seals, walrus, &c. The Norse colonists penetrated on these fishing expeditions at least to 72° N., where a small runic stone from the 14th century has been found. On a voyage in 1267 they penetrated even still farther north into the Melville Bay.
Christianity was introduced by Leif Ericson at the instance of Olaf Trygvason, king of Norway, in 1000 and following years. In the beginning of the 12th century Greenland got its own bishop, who resided at Carolar, near the present Eskimo station Igoliko, on an isthmus between two fjords, Igalkifjord (the old Einarsfjord) and Tunugdillrarik (the old Eriksfjord), inside the present colony Julianehaab. The Norse colonies had a church, a farmstead and a munnery in the Østerbygd, and four churches in the Vesterbygd. Greenland, like Iceland, had a republican organization up to the years 1247 to 1261, when the Greenlanders were induced to swear allegiance to the king of Norway.

Greenland belonged to the Norwegian crown till 1814, when, at the dissolution of the union between Denmark and Norway, neither it nor Iceland and the Faeroes were mentioned, and they, therefore, were kept by the Danish king and thus came to Denmark. The settlements were called respectively Øster Bygd (or eastern settlement) and Vestor (western) Bygd, both being now known to be on the south and west coast (in the districts of Julianehaab and Godthaab respectively), though for long the view was persistently held that the first was on the east coast, and numerous expeditions have been sent in search of these "lost colonies" and their imaginary survivors. These settlements at the height of their prosperity are estimated to have had 10,000 inhabitants, which, however, is an over-estimate, the number having probably been nearer one-half or one-third of that number. The last bishop appointed to Greenland died in 1546, but long before that date those apostles had practically reached their sees; the last bishop who resided in Greenland died there in 1377. After the middle of the 14th century very little is heard of the settlements, and their communication with the motherland, Norway, evidently gradually ceased. This may have been due in great part to the fact that the shipping and trade of Greenland became a monopoly of the king of Norway, who kept only one ship sailing at long intervals (of years) to Greenland; at the same time the shipping and trade of Norway came more and more in the hands of the Hanseatic League, which took no interest in Greenland. The last ship that is known to have visited the Norse colony in Greenland returned to Norway in 1410. With no support from home the settlements seem to have decayed rapidly. It has been supposed that they were destroyed by attacks of the Eskimo, who about this period seem to have become more numerous and to have extended southwards along the coast from the north. This seems a less feasible explanation; it is more probable that the Norse settlers intermarried with the Eskimo and were gradually absorbed. About the end of the 15th or the beginning of the 16th century it would appear that all Norse colonization had practically disappeared. When in 1585 John Davis visited it there was no sign of any people save the Eskimo, among whose traditions are a few directly relating to the old Norsemen, and several traces of Norse influence. For more than two hundred years Greenland seems to have been neglected, almost forgotten. It was visited by whalers, chiefly Dutch, but nothing in the form of permanent European settlements was established until the year 1721, when the first missionary, the Norwegian clergyman Hans Egede, landed, and established a settlement near Godthaab. Amid much opposition at home, Egede carried on his work, and at the present day the native race is civilized and Christianized. Many of the colonists of the 18th century were convicts and other offenders; and in 1750 the trade became a monopoly in the hands of a private company. In 1733-1734 there was a dreadful epidemic of smallpox, which destroyed a great number of the people. In 1774 the trade ceased to be profitable as a private monopoly, and to prevent it being abandoned the government took it over. Julianehaab was founded in the following year. In 1807-1814, owing to the war, communications were cut off with Norway and Denmark; but subsequently the colony prospered in a languid fashion.

Authorities.—As to the discovery of Greenland by the Norsemen and its early history see Konrad Maurer’s excellent paper, "Geschichte der Entdeckung Ostgrönländs" in the report of Die zweite deutsche Nordpolarfahrt 1869-1870 (Leipzig, 1874), vol. 1; G. Storm, Studier om de Färöerne (Copenhagen, 1888); Extrait des Mémoires de l’Académie des Sciences, vol. xvi.; K. J. V. Steenstrup, "Om Østerbygden," Meddelelser om Grønland, part ix. (1882), pp. 1-51; Finnur Jónsson, "Grønlunds gamle Togte," in Meddelelser om Grønland, part xx. (1899), pp. 265-329; Joseph Fischer, The Discoveries of the Norsemen in America, translated from German by B. H. Soulsby (London, 1903). As to the general literature on Greenland, a number of the monographs and modern works have been cited in footnotes. The often-quoted Meddelelser om Grønland is of especial value; it is published in parts (Copenhagen) since 1879, and is chiefly written in Danish, but each part has a summary in French. In part xiii. there is a most valuable collection of letters about Greenland up to 1880. See also Geografiskt Journal, passim.

Amongst other important books on Greenland may be mentioned: Hans Egede, Danmarks og Grønlands historie (Copenhagen, 1745); Egede, Danmarks historiske Mindesmærker (3 vols., Copenhagen, 1838-1845); H. Rink, Danish Greenland (London, 1877); H. Rink, Tales of the Eskimo (London, 1875; see also same, "Eskimo Tribes" in Meddelelser om Grønland, part xl.); Johnstrup, Giesche’s Mineralogiske Reise i Grønland (Copenhagen, 1878). (F. N.)

GREENLAND (a "grassy hill"), a town of Berwickshire, Scotland. Pop. (1901) 611. It is situated on the Blackadder, 62 m. S.E. of Edinburgh by the North British railway company’s branch line from Reston Junction to St Boswells. The town was built towards the end of the 17th century, to take the place of an older one, which stood about a mile to the S.E. It was the county town from 1666 to 1853, when it was removed to the new town of Berwick on Tweed. In 1783-1853, American jurist, was born at Newburyport, Massachusetts, on the 5th of December 1783. When a child he was taken by his father to Maine, where he studied law, and in 1806 began to practise at Standish. He soon removed to Gray, where he practised for twelve years, and in 1818 removed to Portland. He was reporter of the supreme court of Maine from 1820 to 1832, and published nine volumes of Reports of Cases in the Supreme Court of Maine (1822-1833). In 1833 he became Royall professor, and in 1846 succeeded Judge Joseph Story as Dane professor of law in Harvard University; Daneside 1858 he was removed from the active duties, and became professor emeritus. After being for many years president of the Massachusetts Bible Society, he died at Cambridge, Mass., on the 6th of October 1853. Greenleaf’s principal work is a Treatise on the Law of Evidence (3 vols., 1842-1853). He also published A Full Collection of Cases Overruled, Denied, Doubtful, or Limited in their Application, taken from American and English Reports (1821), and Examination of the Testimony of the Four Evangelists by the Rules of Evidence administered in the Courts of Justice, with an account of the Trial of Jesus (London, 1847). He was the author of a pocket guide for the every-day lawyer, "Stone’s Digest of Law respecting Real Property" (3 vols., 1849-1850).

GREEN MONKEY, a west African representative of the typical group of the guenon monkeys technically known as Cercopithecus callitrichus, taking its name from the olive-greenish hue of the fur of the back, which forms a marked contrast to the white whiskers and belly.

GREENOCK, a municipal and police burgh and seaport of Renfrewshire, Scotland, on the southern shore of the Firth of Clyde, 23 m. W. by N. of Glasgow by the Caledonian and Glasgow & South Western railways, 27 m. by the river and firth. Pop. (1901) 68,142. The town has a water frontage of nearly 4 m. and rises gradually to the hills behind the town in which are situated, about 3 m. distant, Loch Thom and Loch Gryfe, from both of which is derived the water supply for domestic use, and for driving several mills and factories. The streets are

---

laid out on the comparatively level tract behind the firth, the older thoroughfares and buildings lying in the centre. The west end contains numerous handsome villas and a fine esplanade, 131 m. long, running from Prince’s Pier to Fort Matilda, which is supplied with submarine mines for the defence of the river. The capacious bay, harbour, and docks, are the ports of Greenock and Lyle House, which long since demolished, is protected by a sandbank that ends here, and is hence known as the Tail of the Bank. The fairway between this bank, which begins to the west of Dumbarton, and the southern shore constitutes the safest anchorage in the upper firth. There is a continuous line of electric tramways, connecting with Port Glasgow on the east and Gourock on the west, a total distance of 7.5 m. The annual rainfall amounts to 64 in. and Greenock thus has the reputation of being the wettest town in Scotland.

Found of the public buildings are fine structures. The municipal buildings, an ornate example of Italian Renaissance, with a tower 244 ft. high, were opened in 1837. The custom house on the old steamboat quay, in classic style with a Doric portico, dates from 1818. The county buildings (1867) have a tower and spire 112 ft. high. The Watt Institution, founded in 1837 by a son of the famous engineer, James Watt, contains the public library (established in 1783), the Watt scientific library (presented in 1851 by Watt himself), and the marble statue of James Watt by Sir Francis Chantrey. Adjoining it are the museum and lecture hall, the gift of James McLean, opened to public use in 1877. The library in the Spence building, founded by the widow of William Spence the mathematician. In addition to numerous board schools there are the Greenock academy for secondary education, the technical college (1900), the school of art, and a school of navigation and engineering. The charitable institutions include the infirmary; the cholina hospital; the eye infirmary; the fever reception house; Sir Gabriel Wood’s mariners’ asylum, an Elizabethan building erected in 1851 for the accommodation of aged merchant seamen; and the Smithson poorhouse and lunatic asylum, built beyond the southern boundary in 1879. Near Albert Harbour stands the old west now the north parish church (a Gothic edifice dating from 1591) containing some stained-glass windows by William Morris; in its kirkyard Burns’s “Highland Mary” was buried (1786). The west parish church in Nicholson Street (1830) is in the Italian Renaissance style and has a campanile. The middle parish church (1759) in Cathcart Square is in the Classic style with a fine spire. Besides burial grounds near the infirmary and attached to a few of the older churches, a beautiful cemetery, 90 acres in extent, has been laid out in the south-western district. The church of St. Matthew’s, in the Lee Greenock Park, Well Park in the heart of the town (these were the gift of Sir Michael Shaw-Stewart), Whin Hill, Lyle Road—a broad drive winding over the heights towards Gourcock, constructed as a “relief work” in the severe winter of 1879-1880.

Greenock is under the jurisdiction of a town council with provost and bailies. It is a parliamentary burgh, represented by one member. The corporation owns the supplies of water (the equipment of works and reservoirs is remarkably complete), gas, electric light and power, and the tramways (leased to a company). The staple industries are shipbuilding (established in 1760) and sugar refining (1755). Greenock-built vessels have always been esteemed, and many Cunard, P. & O. and Allan liners have been constructed in the yards. The town has been one of the chief centres of the sugar industry. Other important industries include the making of boilers, steam-engines, locomotives, anchors, chain-cables, sallcloth, ropes, paper, woolen and worsted goods, besides general engineering, an aluminium factory, a flax-spinning mill, distilleries and an oil-refinery. The seal and whale fisheries, once vigorously prosecuted, are extinct, but the fishing-flots for the home waters and the Newfoundlander grounds are considerable. Till 1772 the town leased the first harbour (finished in 1710) from Sir John Shaw, the superior, but acquired it in that and the following year, and a graving dock was opened in 1786. Since then additions and improvements have been periodically in progress, and there are now several tidal harbours—among them Victoria harbour, Albert harbour, the west harbour, the east harbour, the northern tidal harbour, the western tidal harbour, the great harbour and James Watt dock (completed in 1886 at a cost of £560,000 with an area of 2000 ft. by 400 ft. with a depth at low water of 32 ft.), Garvel graving dock and other deep docks. The qugray areas exceed 100 acres in area and the quay walls are over 3 m. in length. Both the Caledonian and the Glasgow & South-Western railways (in Prince’s Pier the latter company possesses a landing-stage nearly 1400 ft. long) have access to the quays. From first to last the outlay on the harbour has exceeded £5,000,000.

In the earlier part of the 17th century Greenock was a fishing village, consisting of one row of thatched cottages. A century later there were only six slated houses in the place. In 1635 it was erected by Charles I. into a burgh of barony under a charter granted to John Shaw, the government being administered by a baron-bailie, or magistrate, appointed by the superior. Its commercial prosperity received an enormous impetus from the Treaty of Union (1707), under which trade with America and the West Indies rapidly developed. The American War of Independence suspended progress for a brief interval, but revival set in in 1783, and within the following seven years shipping trebled in amount. Meanwhile Sir John Shaw—to whom and to whose descendants, the Shaw-Stewarts, the town has always been indebted—by charter (dated 1741 and 1751) had empowered the inhabitants to found in the firth of Clyde, which was to be the most liberal constitution of any Scots burgh prior to the Reform Act of 1832, when Greenock was raised to the status of a parliamentary burgh with the right to return one member to parliament. Greenock was the birthplace of James Watt, William Spence (1777-1815) and Dr John Caird (1820-1898), principal of Glasgow University, who died in the town and was buried in Greenock cemetery. John Galt, the novelist, was educated in Greenock, where he also served some time in the custom house as a clerk. Rob Roy is said to have raided the town in 1725.

GREENOCKITE, a rare mineral composed of cadmium sulphide, CdS, occurring as small, brilliant, honey-yellow crystals or as a canary-yellow powder. Crystals are hexagonal with hemimorphic development, being differently terminated at the two ends. The faces of the hexagonal prism and of the numerous hexagonal pyramids are deeply striated horizontally. The crystals are translucent to transparent, and have an adamantine to resinous lustre; hardness 3-3½; specific gravity 4-9. Crystals have been found only in Scotland, at one or two places in the neighbourhood of Glasgow, where they occur singly on prehnite or chlorite as radiating stalactoidal hydrated cadmium sulphide—a rather unusual mode of occurrence for a metallic sulphide. The first, and largest crystal (about ½ in. across) was found, about the year 1810, in the dolerite quarry at Bowling in Dumbartonshire, but this was thought to be blende. A larger number of crystals, but of smaller size, were found in 1840 during the cutting of the Bishopon tunnel on the Glasgow & Greenock railway; they were detected by Lord Greenock, afterwards the 2nd earl of Cathcart, after whom the mineral was named. A third locality is the Boyleston quarry near Barrhead. At all other localities—prior in Bohemia, Laurien in Greece, Joplin in Missouri, &c.—the mineral is represented only as a powder dusted over the surface of zinc minerals, especially blende and calamine, which contain a small amount of cadmium replacing zinc.

Isomorphous with greenockite is the hexagonal zinc sulphide (ZnS) known as wurtzite. Both minerals have been prepared artificially, and are not so uncommon as furnace products. Previous to the recent discovery in Sardinia of cadmium oxide as small octahedral crystals, greenockite was the only known mineral containing cadmium as an essential constituent.

GREENORE, a seaport and winterplace of county Louth, Ireland, beautifully situated at the mouth of Carlingford Lough on its western shore. It was brought to importance by the action of the London & North-Western railway company of England, which owns the pier and railways joining the Great Northern system at Dundalk (12½ m.) and Newry (14 m.). A regular
service of passenger steamers controlled by the company runs to Holyhead, Wales, 86 m. S.E. A steam ferry crosses the Lough to Greenstone, for Kilkeel, and the southern watering-places of county Down. The company also owns the hotel, and laid out the golf links. In the vicinity a good example of raised beach, some 10 ft. above present sea-level, is to be seen.

**GREENOUGH, GEORGE BELLAS** (1778-1859), English geologist, was born in London on the 18th of January 1778. He was educated at Eton, and afterwards (1795) entered Pembroke College, Oxford, but never graduated. In 1798 he proceeded to Göttingen to pursue his studies, but having attended the lectures of Blumenbach he was attracted to the study of natural history, and, coming into the possession of a fortune, he abandoned law and devoted his attention to science. He studied mineralogy at Freiburg under Werner, travelled in various parts of Europe and the British Isles, and worked at chemistry at the Royal Institution. A visit to Ireland aroused deep interest in political questions, and he was in 1807 elected member of parliament for the borough of Galton, continuing to hold his seat until 1812. Meanwhile his interest in geology increased, and in 1816 he returned to England. In 1807, he was the chief founder of the Geological Society of London in 1807. He was the first chairman of that Society, and in 1811, when it was more regularly constituted, he was the first president: and in this capacity he served on two subsequent occasions, and did much to promote the advancement of geology. In 1819 he published _A Critical Examination of the First Principles of Geology_, a work which was useful mainly in refuting erroneous theories. In the same year was published his famous _Geological Map of England and Wales_, in six sheets; with a second edition was issued in 1830. This work was to a large extent based on the original map of William Smith; but much new information was embodied. In 1843 he commenced to prepare a geological map of India, which was published in 1854. He died at Naples on the 2nd of April 1855.

**GREENOUGH, HORATIO** (1803-1852), American sculptor, son of a merchant, was born at Boston, on the 6th of September 1805. At the age of sixteen he entered Harvard, but he devoted his principal attention to art, and in the autumn of 1825 he went to Rome, where he studied under Thorwaldsen. After a short visit in 1826 to Boston, where he executed busts of John Quincy Adams and other people of distinction, he returned to Italy and took up his residence at Florence. Here one of his first commissions was from James Fenimore Cooper for a group of Chanting Cherubs; and he was chosen by the American government to execute the colossal statue of Washington for the national capital. It was unveiled in 1843, and was really a fine piece of work for its day; but in modern times it has been sharply criticized as unworthy and incongruous. Shortly afterwards he received a second government commission for a colossal group, the "Rescue," intended to represent the conflict between the Anglo-Saxon and Indian races. In 1837 he returned to Washington to superintend its erection, and in the autumn of 1837 he was attacked by brain fever, of which he died in Somerville near Boston on the 18th of December. Among other works of Greenough may be mentioned a bust of Lafayette, the Medora and the Venus Victrix in the gallery of the Boston Athenæum. Greenough was a man of wide culture, and wrote well both in prose and verse.

See H. T. Tuckerman, _Memoir of Horatio Greenough_ (New York, 1853).

**GREENOUGH, JAMES BRADSTREET** (1833-1901), American classical scholar, was born in Portland, Maine, on the 4th of May 1833. He graduated at Harvard in 1856, studied one year at the Harvard Law School, was admitted to the Michigan bar, and practised in Marshall, Michigan, until 1865, when he was appointed tutor in Latin at Harvard. In 1873 he became assistant professor, and in 1883 professor of Latin, a post which he resigned hardly six weeks before his death at Cambridge, Massachusetts, on the 11th of October 1901. He was general editor of Goodwin's _Moods and Tenses_ (1860), and he set himself to study Latin historical syntax, and in 1870 published _Analysis of the Latin Subjunctive_, a brief treatise, privately printed, of much originality and value, and in many ways coinciding with Belthold Delbrück's _Grundzüge des Conjunctivs und Optativs in Sanskrit und Griechischen_ (1871), which, however, quite overshadowed the _Analysis_. In 1872 appeared _A Latin Grammar for Schools and Colleges_, founded on Comparative Grammar, by Joseph A. Allen and James B. Greenough, a work of great critical carefulness. His theory of casus-constructions was that adopted and developed by William Gardner Hale. In 1872-1880 Greenough offered the first courses in Sanskrit and comparative philology given at Harvard. His fine abilities for advanced scholarship were used outside the classroom in editing the _Green_ and _Green Latin Series of text-books, although he occasionally contributed to _Harvard Studies in Classical Philology_ (founded in 1889 and ended at his instance by his own class) papers on Latin syntax, prosody and etymology—a subject on which he planned a long work—on Roman archaeology and on Greek religion at the time of the New Comedy. He assisted largely in the founding of Radcliffe College. An able English scholar and an excellent etymologist, he collaborated with Professor George Kittredge on _Words and their Ways in English Speech_ (1901), one of the best books on the subject in the language. He wrote clever light verse, including _The Blackbirds, _a comedetta, first published in _The Atlantic Monthly_ (vol. xxxii. 1877); _The Rose and the Ring_ (1880), a pantomime adapted from Thackeray; _The Queen of Hearts_ (1885), a dramatic fantasy; and _Old King Cole_ (1880), an operetta.

The club was the headquarters of the Whigs' opposition to the court, and its members were active promoters of conspiracy and sedition. The president was either Lord Shaftesbury or Sir Robert Peyton, M.P. for Middlesex, who afterwards turned informer. The Green Ribbon Club served both as a debating society and an intelligence department for the Whig faction. Questions under discussion in parliament were here threshed out by the members over their tobacco and ale; the latest news from Westminster or the city was retailed in the tavern, "for some or others were continually coming and going," says Roger North, "as import or exciting news and stories." Shaftesbury said the court or the Tories was invented in the club and sedulously spread over the town, and measures were there concerted for pushing on the Exclusion Bill, or for promoting the pretensions of the duke of Monmouth. The popular credulity as to Catholic outrages in the days of the Popish Plot was stimulated by the scandalmongers of the club, whose members went about in silk armour, supposed to be bullet proof, "in which any man dressed up was as safe as a house," says North, "for it was impossible to strike him for laughing"; while in their pockets, "for street and crowd-work," they carried the weapon of offence invented by Stephen College and known as the "Protestant Flail."

The genius of Shaftesbury found in the Green Ribbon Club the means of constructing the first systematized political organization in England. North relates that "every post conveyed the news and tales legitimated there, as also the malign constructions of all the good actions of the government, especially to places where elections were depending, to shape men's characters into fit qualifications to be chosen or rejected." In the general election of January and February 1679 the Whig interest throughout the country was managed and controlled by a committee sitting at the club in Chancery Lane. The club's organizing activity was also notably effective in the agitation of the Petitioners in 1679. This celebrated movement was engineered from the Green Ribbon Club with all the skill and energy of a modern caucus. The petitions were prepared in London and sent down to every part of the country, where paid canvassers took them from house to house collecting signatures with an air of authority that made refusal difficult. The great "popo-burning" processions in 1680 and 1685, on the anniversary of Queen Elizabeth's accession, were also organized by the club. They ended by the lighting of a huge bonfire in front of the club windows; and as they proved an effective means of inflaming the religious passions of the populace, it was at the Green Ribbon Club that the mobile vulgus first received the nickname of "the mob." The activity of the club was, however, short-lived. The failure to carry the Exclusion Bill, one of the favourite projects of the faction, was a blow to its influence, which declined rapidly after the flight of Shaftesbury, the confiscation of the city of London's charter, and the discovery of the Red House Plot, in which many of its members were implicated. In 1685 John Ayloffe, who was found to have been "a clubber at the King's Head Tavern and a green-ribbon man," was executed in front of the premises on the spot where the "popo-burning" bonfires had been kindled; and although the tavern was still in existence in the time of Queen Anne, the Green Ribbon Club which made it famous did not survive the accession of James II.

The precise situation of the King's Head Tavern, described by North as "over against the Inner Temple Gate," was at the corner of Fleet Street and Chancery Lane, on the east side of the latter thoroughfare.

GREENSAND, in geology, the name that has been applied to no fewer than three distinct members of the Cretaceous System, viz. the Upper Greensand (see GAULT), the Lower Greensand and the so-called Cambridge Greensand, a local phase of the base of the Chalk (q.v.). The term was introduced by the early English geologists for certain sandy rocks which frequently exhibited a greenish colour on account of the presence of minute grains of the green mineral glauconite. Until the fossils of these rocks came to be carefully studied there was much confusion between what is now known as the Upper Greensand (Selbornian) and the Lower Greensand. Here we shall confine our attention to the latter.

The Lower Greensand was first examined in detail by W. H. Fitton (Q.J.G.S. iii., 1847), who, in 1845, had proposed the name "Vectine" for the formation. The name was revived under the form "Ferruginous" in 1855 by A. J. Jukes-Browne, because, although the rocks are generally regarded as ferruginous, the green colour has often been caused by the oxidation of the iron to various shades of red and brown, and other lithological types, clays and limestones represent this horizon in certain areas. The Lower Greensand is typically developed in the Wealden district, in the Isle of Wight, in Dorsetshire about Swanage, and it appears again beneath the northern outcrop of the Chalk in Berkshire, Oxfordshire and Bedfordshire, and thence it is traceable through Norfolk and Lincolnshire into east Yorkshire. It rests conformably upon the Wealden formation in the south of England, but it is clearly separable from the beds beneath by the occurrence of marine fossils, and by the fact that there is a marked overlap of the Lower Greensand on the Weald in Wiltshire, and derived pebbles are found in the basal beds. The whole series is 800 ft. thick at Atherfield in the Isle of Wight, but it thins rapidly westward. It is usually clearly marked off from the overlying Gault.

In the Wealden area the Lower Greensand has been subdivided as follows, although the several members are not everywhere recognizable:—

Isle of Wight.

Folkestone Beds (70-100 ft.). Carstone and Sand rock series.
Sandgate Beds (75-100 ft.). Ferruginous Sands (Shanklin sands).
Ferruginous Sands (Weston sands).
Atherfield Beds (80-300 ft.). Ferruginous Sands (Walpen sands).
Atherfield Clay (20-90 ft.). Atherfield Clay.

The Atherfield Clay is usually a sandy clay, fissiliferous. The basal portion, 5-6 ft., is known as the "Perna bed" from the abundance of Perna Mulleti; other fossils are Hoplites Deshayesii, Exogyra simus, Ancyloceras Mathesoniurn. The Hythe beds are interstratified thin limestones and sandstones; the former are bluish-grey in colour, compact and hard, with a certain amount of quartz and glauconite. The limestone is known as "Kentish Rag" or "Kentish Shingle" (Greenhayes Beds or Kentish Shingle). It has been largely employed as a building stone and roadstone; it frequently contains layers of chert (known as Sevenoaks stone near that town). The sandy portions are very variable; the stone is often clayey and calcareous and rarely hard enough to make a good building stone; locally it is called "hassock" (or Calkstone). The two stones are well exposed in the Iguanodon Quarry near Maidstone (so called from the discovery of the bones of that reptile). South-west of Dorking sandstone and grit become more prevalent, and it is known there as "Bargate stone," much used around Godalming. Bulturough stone is another local sandstone of the Hythe beds. Fuller's earth occurs in parts of this formation in Surrey. The Sandgate beds, mainly dark, argillaceous sand and clay, are well developed in east Kent, and about Midhurst, Pulborough and Petworth. At Nutfield the celebrated fuller's earth deposits occur on this horizon; it is also found near Maidstone, at Bletchingley and Red Hill. The Folkestone beds are light-coloured, rather coarse sands, enclosing layers of siliceous limestone (Folkestone stone) and chert; a phospatic bed is found near the top. These beds are well seen in the cliffs at Folkestone and Cape Griz Nez. Ightham there is a fine, hard, white sandstone along with a green, quartzitic variety (Ightham stone). In Sussex the limestone and chert are usually lacking, but a ferruginous grit, "carstone," occurs in lenticular masses and layers, which is used for road metal at Pulborough, Fittleworth, &c.

The Lower Greensand usually forms picturesque, healthy country, as about Leith Hill, Hindhead, Midhurst, Petworth, at Woburn, or at Shanklin and Sandown in the Isle of Wight. Outside the southern area the Lower Greensand is represented by the Farningdon sponge-bearing beds in Berkshire, the Sandy and
GREENSBORO—GREENVILLE

Putton beds in Bedfordshire, the Shotover iron sands of Oxfordshire, the sands and fuller's earth of Woburn, the Leighton Buzzard sands, the brick clays of Snettisham, and perhaps the Sandringham sands of Norfolk, and the carstone of that county and Lincolnshire. The upper ironstone, limestone and clay of the Lincolnshire Tealby beds appear to belong to this horizon along with the upper part of the Speeton beds of Yorkshire. The sands of the Lower Greensand are largely employed for the manufacture of glass, for which purpose they are dug at Aylesford, Godstone, near Reigate, Hartshill, near Aylesbury and other places; the ferruginous sand is worked as an iron ore at Sealed.

This formation is continuous across the channel into France, where it is well developed in Boulonnais. According to the continental classification the Atherfield Clay is equivalent to the Urgonian or Barremian; the Sandgate and Hythe beds belong to the Aptian (q.v.); while the upper part of the Folkestone Kelham would fall within the lower Albian (q.v.).

GREENSBORO, a city and the county-seat of Guilford county, North Carolina, U.S.A., about 60 m. N.W. of Raleigh. Pop. (1890) 3317, (1900) 10,035, of whom 4086 were negroes; (1910 census), 15,895. Greensboro is served by several lines of the Southern railway. It is situated in the Piedmont region of the state and has an excellent climate. The city is the seat of the High Point College, co-educational, (1875); Greensboro Female College (Methodist Episcopal, South; chartered in 1838 and opened in 1846), of which the Rev. Charles F. Deems was president in 1830-1854, and which, owing to the burning of its buildings, was suspended from 1863 to 1874; and of two institutions for negroes—A State Agricultural and Mechanical College, and Bennett College (Methodist Episcopal, co-educational, 1873). Another school for negroes, Immanuel Lutheran College (Evangelical Lutheran, co-educational), was opened at Concord, N.C., in 1903, was removed to Greensboro in 1905, and in 1907 was established at Lutherville, E. of Greensboro. About 6 m. W. of Greensboro is Guilford College (co-educational; Friends), founded as "New Garden Boarding School" in 1837 and re-chartered under its present name in 1888. Greensboro has a Carnegie library, St Leo hospital and a large auditorium. It is the shipping-point for an agricultural, lumbering and trucking region, among whose products Indian corn, tobacco and cotton are especially important; is an important insurance centre; has a large wholesale trade; and has various manufactures, including cotton goods (especially blue denim), tobacco and cigars, luggage and furniture, and United States machinery. The chief products are goods, flour, saw-mills, and terra-cotta. The value of the factory products increased from $925,411 in 1900 to $1,828,837 in 1905, or 97.6%.

The municipality owns and operates the water-works. Greensboro was named in honour of General Nathanael Greene, who on the 13th of March 1781 fought with Cornwallis the battle of Guilford Court House, about 6 m. N.W. of the city, where there is now a Battle-Ground Park of 100 acres (including Lake Willong); this park contains a Revolutionary museum, and twenty-nine monuments to General Greene; Coosawtuck, an arch (1906) in memory of Brig.-General Francis Nash (1752-1770) of North Carolina, who died in October 1777 of wounds received at Germantown, and Davidson Arch (1895), in honour of William Lee Davidson (1746-1781), a brigadier-general of North Carolina troops, who was killed at Catawba and in whose honour Davidson College, at Davidson, N.C., was named. Greensboro was founded and became the county-seat in 1808, was organized as a town in 1829, and was first chartered as a city in 1870.

One of the first cotton mills in the South and probably the first in this state was established at Greensboro in 1832. It closed about 20 years afterwards, and in 1889 new mills were built. There were three large mills built in the decade after 1895, and three mill villages for location upon the Blue Ridge near Greensboro. The three mills, lie immediately N. of the city; in 1908 their population was estimated at 8000. The owners of these mills maintain schools for the children of operatives and carry on "welfare work " in these villages.

GREENSBURG, a borough and the county-seat of Westmoreland county, Pennsylvania, U.S.A., 31 m. E.S.E. of Pittsburgh. Pop. (1890) 4020; (1900) 6508 (484 foreign-born); (1910) 5420. It is served by two lines of the Pennsylvania railway.

It is an important coal centre, and manufactures engines, iron and brass goods, flour, lumber and bricks. In addition to its public school system, it has several private schools, including St Mary's Academy and St Joseph's Academy, both Roman Catholic. About 3 m. N.E. of what is now Greensburg stood the village of Hanna's town, settled about 1770 and almost completely destroyed by Indians on the 13th of July 1782; here what is said to have been the first towns in the West was taken on the 6th of April 1773, and the county courts continued to be held here until 1787. Greensburg was settled in 1784-1785, immediately after the opening of the state road, not far from the trail followed by General John Forbes on his march to Fort Duquesne in 1758; it was made the county-seat in 1787, and was incorporated in 1792. In 1805 the boroughs of Ludwick (pop. in 1900, 901), East Greensburg (1906), and South-east Greensburg (620) were merged with Greensburg.

GREENSHANK, one of the largest of the birds commonly known as sandpipers, the Tatorus glosus of most ornithological writers. Some exercise of the imagination is however needed to see in the dingy olive-coloured legs of this species a justification of the English name by which it goes, and the application of that name, which seems to be due to Pennant, was probably by way of distinguishing it from two allied but perfectly distinct species of Tatorus (T. calidris and T. fuscus) having red legs and usually called redshanks. The greenshank is a native of the northern part of the Old World, but in winter it wanders far to the south, and occurs regularly at the Cape of Good Hope, in India and thence throughout the Indo-Malay Archipelago to Australia. It has also been recorded from North America, but its appearance there must be considered accidental. Almost as bulky as a woodcock, it is of a much more slender build, and its long legs and neck give it a graceful appearance, which is enhanced by the activity of its actions. Disturbed from the moor or marsh, where it has its nest, it rises swiftly into the air, conspicuous by its white back and rump, and uttering shrill cries flies round the village or farm, this white band on the topmost bough of a tree, if a tree be near, to watch his proceedings, and the cock exhibits all the astounding gesticulations in which the males of so many other Limicolea indulge during the breeding-season—with certain variations, however, that are peculiarly its own. It breeds in no small numbers in the Hebrides, and parts of the Scottish Highlands from Argyllshire to Sutherland, as well as in the more elevated or more northern districts of Norway, Sweden and Finland, and probably also thence to Kamschatka. In North America it is represented by two species, Tatorus semipalmatus and T. melanoleucus, there called willets, telltales or tattlers, which in general habits resemble the greenshank of the Old World.

GREENVILLE, a city and the county-seat of Washington county, Mississippi, U.S.A., on the E. bank of the Mississippi river, about 75 m. N. of Vicksburg. Pop. (1890) 6658; (1900) 7642 (4987 negroes); (1910) 9610. Greenville is served by the Southern and the Yazoo & Mississippi Valley railways, and by various passenger and freight steamboat lines on the Mississippi river. It is situated in the centre of the Yazoo Delta, a rich cotton-producing region, and its industries are almost exclusively connected with that staple. There are large warehouses, compresses and gins, extensive cotton-seed oil works and sawmills. Old Greenville, about 1 m. S. of the present site, was the county seat of Jefferson county until 1825 (when Fayette succeeded it), and later became the county-seat of Washington county. Much of the old town caved into the river, and during the Civil War it was burned by the Federal forces soon after the capture of Memphis. The present site was then adopted. The town of Greenville was incorporated in 1879; in 1886 it was chartered as a city.
GREENVILLE, a city and the county-seat of Darke county, Ohio, U.S.A., on Greenville Creek, 36 m. N.W. of Dayton. Pop. (1900) 5501; (1910) 6237. It is served by the Pittsburgh, Cincinnati, Chicago & St. Louis and the Cincinnati Northern railways, and by interurban electric railways. It is situated about 1050 ft. above sea-level and is the trade centre of a large and fertile agricultural district, producing cereals and tobacco. It manufactures lumber, foundry products, canned goods and creamery products and has grain elevators and warehouse. In the city is a Carnegie library and 3 m. distant there is a county Children's Home and Infirmary. The municipality owns and operates its water-works. Greenville occupies the site of an Indian village and of Fort Greenville (built by General Anthony Wayne in 1793 and burned in 1796). Here, on the 3rd of August 1795, General Wayne, the year after his victory over the Indians at Fallen Timbers, concluded with them the treaty of Greenville, the Indians agreeing to a cessation of hostilities and ceding to the United States a considerable portion of Ohio and a number of small tracts in Indiana, Illinois and Michigan (including the sites of Sandusky, Toledo, Defiance, Fort Wayne, Detroit, Mackinac, Peoria and Chicago), and the United States agreeing to pay to the Indians $20,000 worth of goods immediately and an annuity of $5,000, for ever. The tribes concerned were the Wyandots, the Delawares, the Shawnees, the Ottawas, the Chippewas, the Pottawatomies, the Miami, the Wees, the Kickapoos, the Flatshakas, the Kaskaskias and the Eel-eriver tribe. Tecumseh lived at Greenville from 1805 to 1809, and a second Indian treaty was negotiated there in July 1814 by General W. H. Harrison and Lewis Cass, by which the Wyandots, the Delawares, the Shawnees, and the (Ohio) Senecas and the Miami agreed to aid the United States in the war with Great Britain. The first permanent white settlement of Greenville was established in 1808 and the town was laid out in the same year. It was made the county-seat of the newly erected county in 1809, was incorporated as a town in 1838 and chartered as a city in 1887.

GREENVILLE, a city and the county-seat of Greenville county, South Carolina, U.S.A., on the Reedy river, about 140 m. N.W. of Columbia, in the N.W. part of the state. Pop. (1890) 5807; (1900) 11,860, of whom 5144 were negroes; (1910) census 15,741. It is served by the Southern, the Greenville & Knoxville and the Charleston & Western Carolina railways. It lies 976 ft. above sea-level, near the foot of the Blue Ridge Mountains, its climate and scenery attracting summer visitors. It is in an extensive cotton-growing and cotton-manufacturing district. Greenville's chief interest is in cotton, but it has various other manufactures, including carriages, wagons, iron and fertilizers. The total value of the factory products of the city in 1905 was $1,676,774, an increase of 73.5% since 1900. Lewis Cass, by which the Wyandots, the Delawares, the Shawnees, the (Ohio) Senecas and the Miami agreed to aid the United States in the war with Great Britain. The first permanent white settlement of Greenville was established in 1808 and the town was laid out in the same year. It was made the county-seat of the newly erected county in 1809, was incorporated as a town in 1838 and chartered as a city in 1887.

GREENVILLE, a city and the county-seat of Greenville county, South Carolina, U.S.A., on the Reedy river, about 140 m. N.W. of Columbia, in the N.W. part of the state. Pop. (1890) 5807; (1900) 11,860, of whom 5144 were negroes; (1910) census 15,741. It is served by the Southern, the Greenville & Knoxville and the Charleston & Western Carolina railways. It lies 976 ft. above sea-level, near the foot of the Blue Ridge Mountains, its climate and scenery attracting summer visitors. It is in an extensive cotton-growing and cotton-manufacturing district. Greenville's chief interest is in cotton, but it has various other manufactures, including carriages, wagons, iron and fertilizers. The total value of the factory products of the city in 1905 was $1,676,774, an increase of 73.5% since 1900. Lewis Cass, by which the Wyandots, the Delawares, the Shawnees, the (Ohio) Senecas and the Miami agreed to aid the United States in the war with Great Britain. The first permanent white settlement of Greenville was established in 1808 and the town was laid out in the same year. It was made the county-seat of the newly erected county in 1809, was incorporated as a town in 1838 and chartered as a city in 1887.

GREENVILLE, a city and the county-seat of Greenville county, South Carolina, U.S.A., on the Reedy river, about 140 m. N.W. of Columbia, in the N.W. part of the state. Pop. It was made the county-seat of the newly erected county in 1809, was incorporated as a town in 1838 and chartered as a city in 1887.
The most noteworthy buildings are the hospital and the observatory. Greenwich Hospital, as it is still called, became in 1873 a Royal Naval College. Upon it or its site centre nearly all the historical associations of the place. The noble buildings, contrasting strangely with the wharves adjacent and opposite to it, make a striking picture, standing on the low river-bank with a background formed by the wooded elevation of Greenwich Park. They occupy the site of an ancient royal palace called Greenwich House, which was a favourite royal residence as early as 1300, but was granted by Henry V. to Thomas Beaufort, duke of Exeter, from whom it passed to Humphrey, duke of Gloucester, who largely improved the property and named it Placentia. Behind this pleasure palace were the hospital and almshouses of the corporation of Greenwich, into which some of the hospital property was conveyed by Queen Elizabeth, and here Edward VI. died. The building was enlarged by Edward IV., by Henry VIII., who made it one of his chief residences, by James I. and by Charles I., who erected the "Queen's House" for Henrietta Maria. The tenure of land from the crown "as of the manor of East Greenwich" became at this time a recognized formula, and occurs in a succession of American colonial charters from those of Virginia in 1606, 1609 and 1612 to that of New Jersey in 1674. Along with other royal palaces, Greenwich was bequeathed to the corporation by King Charles II., but it reverted to the crown on the restoration of Charles II., by whom it was pulled down, and the west wing of the present hospital was erected as part of an extensive design which was not further carried out. In its unfinished state it was assigned by the patent of William and Mary to certain of the great officers of state, as commissioners for its conversion into a hospital for seamen; and it was opened as such in 1705.

The building consists of four blocks. Behind a terrace 860 ft. in length, stretching along the river side, are the buildings erected in the time of Charles II. from Inigo Jones's designs, and in that of Queen Anne from designs by Sir Christopher Wren; and behind these buildings are on the west those of King William and on the east those of Queen Mary, both from Wren's designs. In the King William range is the painted hall. Here in 1806 the remains of Nelson lay in state before their burial in St Paul's Cathedral. Its walls and ceiling were painted by Sir James Thornhill with various emblematic devices, and it is hung with portraits of the most distinguished admirals and paintings of the chief naval battles of England. In the Queen Anne range is the Royal Naval Museum, containing models, relics of Nelson and of Franklin, and other objects. In the centre of the principal quadrangle of the hospital there is a statue of George II. by Rysbrack, sculptured out of a single block of marble taken from the French by Admiral Sir George Rooke. In the upper quadrangle is a bust of Nelson by Chantrey, and there are various other memorials and relics. The oldest part of the building was in some measure rebuilt in 1811, and the present chapel was erected to replace one destroyed by fire in 1779. The endowments of the hospital were increased at various periods from bequests and forfeited estates. Formerly 2700 retired seamen were boarded within it, and 5000 or 6000 others, called out-pensioners, received stipends at various rates out of its funds; but in 1865 an act was passed empowering the Admiralty to grant liberal pensions in lieu of food and lodging to such of the inmates as were willing to quit the hospital, and in 1869 another act was passed making their leaving on these conditions compulsory. It was then devoted to the accommodation of the students of the Royal Naval College, the Infirmary being granted to the Seamen's Hospital Society. Behind the College is the Royal Hospital School, where 1000 boys, sons of petty officers and seamen, are boarded.

To the south of the hospital is Greenwich Park (185 acres), lying high, and commanding extensive views over London, the Thames and the plain of Essex. It was enclosed by Humphrey, duke of Gloucester, and laid out by Charles II., and contains a fine avenue of Spanish chestnuts planted in his time. In it is situated the Royal Observatory, built in 1675 for the advancement of navigation and nasal astronomy. From it the exact time is conveyed each day at one o'clock by electric signal to the chief towns throughout the country; British and the majority of foreign geographers reckon longitude from its meridian.

A standard clock and measures are seen at the entrance. A new building was completed in 1899, the magnetic pavilion lying some 400 yds. to the east, so placed to avoid the disturbance of instruments which would be occasioned by the iron used in the principal building. South of the park lies the open common of Blackheath, mainly within the borough of Lewisham, and in the east the borough includes the greater part of Woolwich Common.

At Greenwich an annual banquet of cabinet ministers, known as the whitewash dinner, formerly took place. This ceremony continued till 1865. Behind the dinner was the building of the hospital, erected by the Earl of Darnley, on the Essex shore of the Thames, by the commissioners for engineering works carried out there in 1705-1720—a remarkable achievement for this period—to save the lowlands from flooding. To one of these dinners Pitt was invited, and was subsequently accompanied by some of his colleagues. Early in the 19th century the venue of the dinner, which had now become a ministerial function, was transferred to Greenwich, and though at first not always held here, was later celebrated regularly at the "Ship," an hotel of ancient foundation, closed in 1908. The banquet continued till 1860, was revived in 1874-1896, and was held for the last time in 1894.

The parish church of Greenwich, in Church Street, is dedicated to St Alphege, archbishop, who was martyred here by the Danes in 1012. In the church Wolfe, who died at Quebec (1759), and Tallis, the musician, are buried. A modern stained-glass window commemorates Wolfe.

The parliamentary borough of Greenwich returns one member. Two burgesses were returned in 1577, but it was not again represented till the same privilege was conferred on it in 1832. The borough council consists of a mayor, five aldermen and thirty councillors.

GREENWOOD, FREDERICK (1830-1900), English journalist and man of letters, was born in April 1830. He was one of three brothers—the others being James and Charles—who all gained reputation as journalists. Frederick started life in a printing house, but at an early age began to write in periodicals. In 1853 he contributed a sketch of Napoleon III. to a volume called The Napoleon Dynasty (2nd ed., 1855). He also wrote several novels: The Loves of an Apothecary (1854), The Path of Rosy (1853) and (with his brother James) Under a Cloud (1866). To the second number of the Cornhill Magazine he contributed "An Essay without End," and this led to an introduction to Thackeray. In 1862, when Thackeray resigned the editorship of the Cornhill, Greenwood became joint editor with G. H. Lewes. In 1864 he was appointed sole editor, a post which he held until 1868. While at the Cornhill he wrote an article in which he suggested, to some extent, how Thackeray might have intended to conclude his unfinished work Denis Duval, and in its pages appeared Margaret Denham's History, Greenwood's most ambitious work of fiction, published in volume form in 1864. At that time Greenwood had conceived the idea of an evening newspaper, which, while containing "all the news proper to an evening journal," should, for the most part, be made up "of original articles upon the many things which engage the thoughts, or employ the energies, or amuse the leisure of mankind." Public affairs, literature and art, "and all the influences which strengthen or dissipate society" were to be discussed by men whose independence and authority were equally unquestionable. Canning's Anti-Jacobin and the Cottager of 1864 were the joint models Greenwood had before him. The idea was taken up by Mr George Smith, and the Pall Mall Gazette (so named after Thackeray's imaginary paper in Pendennis) was launched in February 1865, with Greenwood as editor. Within a few years he had come to exercise a great influence on public affairs. His views somewhat rapidly ripened from what was described as philosophic Liberalism into Conservatism. No minister in Great Britain, Mr Gladstone declared, ever had a more able, a more zealous, a more effective supporter for his policy than Lord Beaconsfield.
GREENWOOD, J. - GREGARINES

had in Greenwood. It was on the suggestion of Greenwood that Beaufort purchased in 1875 the Susz Canal shares of the Khyeative Ismail; the British government being ignorant, until informed by Greenwood, that the shares were for sale and likely to be bought by France. It was characteristic of Greenwood that he declined to publish the news of the purchase of the shares in the Pall Mall before the official announcement was made.

Early in 1880 the Pall Mall changed owners, and the new proprietor required it to support Liberal policy. Greenwood at once resigned his editorship, but in May a new paper, the St James's Gazette, was started for him by Mr Henry Hucks Gilbey (afterwards Lord Aldenham), and Greenwood agreed to carry on in it the tradition which he had established in the Pall Mall. At the St James's Greenwood remained for over eight years, continuing to exercise a marked influence upon political affairs, notably as a pungent critic of the Gladstone administration (1880-1885) and an independent supporter of Lord Salisbury. His connexion with the paper ceased in August 1888, owing to disagreements with the new proprietor, Mr E. Steinkopf, who had bought the St James's at Greenwood's own suggestion. In January 1893 Greenwood brought out a weekly review which he named the Anti-Jacobin. It failed, however, to gain public support, the last number appearing in January 1892. In 1893 he published The Lover's Lexicon and in 1894 Imagination in Dreams. He continued to express his views on political and social questions in contributions to newspapers and magazines, writing frequently in the Westminster Gazette, the Pall Mall, Blackwood, the Cornhill, &c. Towards the end of his life his political views reverted in some respects to the Liberalism of his early days.

In the words of George Meredith "Greenwood was not only a great journalist, he had a statesman's head. The national interests were always urgent at his heart." He was remarkable for securing for his papers the services of the ablest writers of the day, and for the gift of recognizing merit in new writers, such, for instance, as Richard Jeifries and J. M. Barrie. His instinct for capacity in others was as sure as was his journalistic judgment. In 1905, on the occasion of his 75th birthday, a dinner was given in his honour by leading statesmen, journalists, and men of letters (with John Morley—who had succeeded him as editor of the Pall Mall—in the chair). In May 1900 he contributed to Blackwood an article on "The New Journalism," in which he drew a sharp contrast between the old and the new conditions under which the work of a newspaper writer is conducted. He died at Sydenham on the 14th of December 1900.

See Honouring Frederick Greenwood, being a report of the speeches at the dinner on the 8th of April 1905 (London, privately printed, 1905), and of the Preface, Foreword, and Dedication to the same. Greenwood contributed to Greenwood to the Pall Mall of the 14th of April 1897; "The Blowing of the Trumpet" in the introduction to the St James's (May 31, 1886); obituary notices in the Athenaeum (Dec. 25, 1900) and The Times (Dec. 17, 1900).

GREENWOOD, JOHN (d. 1593). English Puritan and Separatist (the date and place of his birth are unknown), entered as a sizar at Corpus Christi College, Cambridge, on the 18th of March 1577-1578, and commenced B.A. 1581. Whether he was directly influenced by the teaching of Robert Browne (q.v.), a graduate of the same college, is uncertain; in any case he held strong Puritan opinions, which ultimately led him to Separatism of the most rigid type. In 1581 he was chaplain to Lord Rich, at Rochford, Essex. At some unspecified time he had been made deacon by John Ayler, bishop of London, and priest by Thomas Cooper, bishop of Lincoln; but ere long he renounced this ordination as "wholly unlawful." Details of the next few years are lacking; but by 1586 he was the recognized leader of the London Separatists, of whom a considerable number had been imprisoned at various times since 1567. Greenwood was arrested early in October 1586, and the following May was committed to the Fleet prison for an indefinite time, in default of bail for conformity. During his imprisonment he wrote some controversial tracts in conjunction with his fellow-prisoner Henry Barrowe (q.v.). It is understood to have been at liberty in the autumn of 1588; but this may have been merely the liberty of the prison." However, he was certainly at large in September 1592, when he was elected "teacher" of the Separatist church. Meanwhile he had written (1590) "An Answer to George Gifford's pretended Defence of Read Prayers." On the 5th of December he was again arrested; and the following March was tried, together with Barrowe, and condemned to death on a charge of "devising and circulating seditious books." After two respite, one at the foot of the gallows, he was hanged on the 6th of April 1593.

GREG, WILLIAM RATHBONE (1809—1881), English essayist, the son of a merchant, was born at Manchester in 1809. He was educated at the university of Edinburgh and for a time managed a mill of his father's at Bury, and in 1832 began business on his own account. He entered with ardour into the struggle for free trade, and obtained in 1842 the prize offered by the Anti-Corn Law League for the best essay on "Agriculture and the Corn Laws." He was too much occupied with political, economical and theological speculations to have given attention to his business, which he gave up in 1850 to devote himself to writing. His Creed of Christendom was published in 1851, and in 1852 he contributed no less than twelve articles to four leading quarterlies. Disraeli praised him; Sir George Cornewall Lewis bestowed a Commissionership of Customs upon him in 1856; and in 1864 he was made Comptroller of the Stationery Office. Besides contributions to periodicals he produced several volumes of essays on political and social philosophy. The general spirit of these is indicated by the titles of two of the best known: The Enigmas of Life (1872) and Rocks Ahead (1874). They represent a reaction from the high hopes of the author's youth, when wise legislation was assumed to be a remedy for every public ill. Greg was a man of deep moral earnestness of character and was interested in many philanthropic works. He died at Wimbledon on the 19th of November 1881. His brother, ROBERT HYDE GREG (1809—1879), was an economist and antiquary of some distinction. Another brother, SAMUEL GREG (1804—1876), became well known in Lancashire by his philanthropic efforts on behalf of the working-people. Percy Greg (1836—1899), son of William Rathbone Greg, also wrote, like his father, on politics, but his views were violently reactionary. His History of the United States to the Reconstruction of the Union (1887) is a polemic rather than a history.

GREGARINES (mod. Lat. Gregarina, from gregarus, collecting in a flock or herd, geza) a large and abundant order of Sporozoa Ectospora, in which a very high degree of morphological specialization and cytological differentiation of the cell-body is frequently found. On the other hand, the life-cycle is, in general, fairly simple. Other principal characters which distinguish Gregarines from allied Sporozoan parasites are as follows—The fully-grown adult (trichosporate) is always "free" in some internal cavity, i.e. it is extracellular; in nearly all cases prior to sporulation two Gregarines (associates) become attached to one another, forming a couple (syzygy), and are surrounded by a common cyst; inside the cyst the body of each associate becomes segmented up into a number of sexual elements (gametes, primary sporoblasts), which then conjugate in pairs; the resulting copula (zygote, definitive sporoblast) becomes usually a spore by the secretion of spore-membranes (sporocyst), its micropyle (sporoplasm) dividing up to form the germs (sporozoites).

F. Redi (1684) is said to have been the first to observe a Gregarine parasite, but his claim to this honour is by no means certain. Much later (1787) Cavolini described and figured an indubitable Gregarine (probably the form now known as Aggregata conformis) from a Crustacean (Pachygrapthus) which, however, he regarded as a tapeworm. Leon Dufour, who in his researches on insect anatomy came across several species of these parasites, also considered them as allied to the worms and proposed the generic name of Gregarina.
The unicellular nature of Gregarines was first realized by A. von Kölliker, who from 1845–1848 added considerably to our knowledge of the frequent occurrence and wide distribution of these organisms. Further progress was due to F. Stein who demonstrated about this time the relation of the "pseudonavicellae" (spores) to the reproduction of the parasites.

Apart from the continually increasing number of known species, matters remained about this stage for many years. It is, in fact, only since the closing years of the 19th century that the complete life-history has been fully worked out; this has now been done in many cases, thanks to the researches of M. Siedlecki, L. Cuñot, L. Léger, O. Duboscq, A. Laveran, M. Caullery, F. Mesnil and others, to whom also we owe most of our knowledge regarding the relations of the parasites to the cells of their host during their early development.

Gregarines are essentially parasites of Invertebrates; they are not known to occur in any true Vertebrate although met with in some Ascidians. By far the greatest number of hosts is furnished by the Arthropods. Many members of the various groups of worms (especially the Annelids) also harbour the parasites, and certain very interesting forms are found in Echinoderms; in the other classes, they either occur only sporadically or else are absent. Infection is invariably of the accidental (casual) type; by way of the alimentary canal, the spores being usually swallowed by the host when feeding; a novel variation of this method has been described by Woodcock (81) in the case of a Gregarine parasitic in Cucumaria, where the spores are sucked up through the cloaca into the respiratory trees, by the inhalant current.

The favourite habitat is either the intestine (fig. 1) or its diverticula (e.g. the Malpighian tubules), or the body-cavity.

In the latter case, after infection has occurred, the liberated germ may traverse the intestinal epithelium. They may come to rest in the connective tissue of the sub-mucosa (remain-

or elongated; in one or two instances (e.g., Diplostyla) it is spherical, and, on the other hand, in Paraspora (fig. 3) it is greatly drawn out and veriform. Once the body is divided into two distinct but unequal regions or halves, the anterior part being known as the protomerite, the hinder, generally larger, as the deutomerite. This feature is closely associated with another morphological character, one which is observable, however, only during the earlier stages of growth and development, namely, the presence of a definite organ, the epimerite, which serves for the attachment of the proto-, or addenser part of the sporozoite to the host-cell (fig. 6).

In those Gregarinias (monocellular ulcers) in which epimerites are absent, the attachment occurs by means of a minute projection or beak (rostrum) at the anterior end of the sporozoite, which penetrates the host’s body and establishes its way into the cell, followed by the first part of the growing germ. This portion of the body increases in size much quicker at first than the rest of the organism, which extends between the proto- and deutomerite (fig. 6) and forms the well-developed epimerite or septum of the sporozoite (fig. 6).

The extracellular part of the Gregarina grows rapidly, and a transverse septum is formed at a short distance away from (outside) the point where the body penetrates into the cell (fig. 6); this marks the limit of the protomerite (distally). Léger thinks that this partition most likely owes its origin to trophic considerations, i.e., to the slightly different manner in which the two halves of the young parasite (the proximal, largely extracellular part, and the distal, intracellular part) are supposed to obtain their nutrition. In the case of the one half, the host supplies the nutrient, in that of the other, the intestinal liquid; and the septum is, as it were, the limit between these two methods. Nevertheless, the present writer does not think that mechanical considerations should be altogether left out of account. The septum may also be, to some extent, an adaption for strengthening the body of the fixed parasite against lateral thrusts or strains, due to the impact of foreign bodies (food, &c.) in the intestine.

In those Gregarinias where the body becomes actually intracellular, it is constricted, and this constriction marks the protomerite (fig. 6). Internally, from the middle portion (between this point and the septum), which is the deutomerite. Further growth occurs, and the protomerite is cut off from the extracellular regions, and the epimerite often appears to appear ultimately as a small appendage at the anterior end of the deutomerite. A Gregarina at this stage is known as a caphalan. Later on, the parasite breaks loose from the host-cell and becomes free in the lumen, the separation taking place at the constriction between the deutomerite and the epimerite, and the latter is left behind in the remains of the host-cell, the former being the anterior part of the free trophozoite (fig. 6). As a result of the contraction, to be observed in many forms. The peculiar gliding movements were formerly thought to be produced by the extrusion of a gelatinous thread posteriorly, but Crawford (8) has recently ascribed them to a complicated succession of wave-like contractions of the myocyte layer. This view is supported by the fact that certain conoperative forms, like Diplostyla and others, which either lack muscle-fibres or else show no oocystic differentiation at all, are non-motile. The endoplasm, or nutritive plasm, consists of a semi-fluid matrix in which are embedded vast numbers of grains and spherules of various kinds and of all sizes, representing an accumulation of food-material which is being stored up prior to reproduction. The largest and most abundant grains are of a substance termed para-glycogen, a carbohydrate; in addition, flattened

**Fig. 5.**—Part of a section through the apparatus of fixation of a *Pteroechus,* showing root-like processes extending from the Gregarina between the epithelial cells. (Léger’s fig. 18; 19 in the case of a new Gregarina, *Triaenocystis.* In this form the body is elongated and metamerically segmented, recalling that of a segmented worm, the adult trophozoon possessing numerous partitions or segments (each corresponding to a segment of the proto- and deutomerite) in an ordinary Polycaudulata, which divide up the cytoplasm into roughly equal compartments. Léger thinks only the deutomerite becomes thus segmented, the protomerite remaining small and undivided. The nucleus remains small, so that there is no question as to the unicellular or individual nature of the entire animal.

**The general cytoplasm** consists of distinct ectoplasm and endoplasm, and is limited by a membrane or cuticle (epicyte), secreted by the former. The cuticle varies considerably in thickness, being well developed in active, intestinal forms, but very thin and delicate in non-motile coelomic forms (e.g., Diplostyla). In the former case it may show longitudinal striations. The cuticle also forms the hooks or spines of many epimerites. The ectoplasm usually shows (fig. 9A) a differentiation into two distinct layers, an outer, firmer layer, clear and hyaline, the sarcocyte, and an inner layer, the myocyte, which is practically a network of a network of muscle-fibres (mainly longitudinal and transverse, fig. 9B). The sarcocyte alone constitutes the septum, traversing the endoplasm, in septate Gregarinias. The myonemes are undoubtedly the agents responsible for the active "gregarinoid" movements (these movements (fig. 19) of the contraction) to be observed in many forms. The peculiar gliding movements were formerly thought to be produced by the extrusion of a gelatinous thread posteriorly, but Crawford (8) has recently ascribed them to a complicated succession of wave-like contractions of the myocyte layer. This view is supported by the fact that certain conoperative forms, like Diplostyla and others, which either lack muscle-fibres or else show no oocystic differentiation at all, are non-motile. The endoplasm, or nutritive plasm, consists of a semi-fluid matrix in which are embedded vast numbers of grains and spherules of various kinds and of all sizes, representing an accumulation of food-material which is being stored up prior to reproduction. GREGARINES

lenticular plates, of an albuminous character, and highly-refrangent granules often occur.

The nucleus is always lodged in the endoplasm, and, in the septate forms, in the deutomerite half of the body. It is normally spherical and always limited by a distinct nuclear membrane, which itself often contains chromatin. The most characteristic feature of the nucleus is the deeply-vacuolated, or more or less vacuolated spherical karyosome (consisting of chromatin intimately bound up with the two plates) which is invariably present. In one or two instances (e.g. Diplacytis schneideri) the nucleus has more than one karyosome, and in some cases at any rate (e.g. Diplodina, Lankesteria) there is a well-marked nuclear reticulum which is impregnated with granules and dots of chromatin.

A sexual multiplication (schizogony) is only known certainly to occur in a few cases, one being in a Monocystidium form, a species of Genaspora, which is for a long time intracellular (Caullery and Mesnil [4]), the rest among the Schizogregarines, as named for this reason, in which schizogenous fission takes place regularly during the free, trophic condition. Usually, the body divides up, by a process of multiple fission (fig. 10), into a few (up to eight) daughter-individuals; but in a new genus (Eleutherocystis), Brasil (3) finds that a great number of little merozoites are formed, and a large amount of vacuolated cytosome is left over unused.

In the vast majority of Gregarines, however, the sp. is not connected to gametogony and sporogony. A very general, if not indeed universal, prelude to gametogony is the characteristic and important feature of the order, known as association, which biological significance of which has only recently been brought out (see H. M. Woodcock [31]). In normal association, two individuals which are to be regarded as of opposite sex, come into close contact with each other and remain thus attached. The manner in which the parasites join varies in different forms; the association may be end-to-end (terminal), either by like or by unlike poles, or it may be side-to-side (lateral) association (fig. 12). The couple (zyzygy) thus formed enters into the encystment and sporoblast-formation (Lankesteria, Monocystis), or may continue in the trophic phase for some time longer (Gregarina). In one or two instances (Zygocystis), association occurs as soon as the trophozoites become adult. This leads on to the interesting phenomenon of precocious association (neogamy), found in non-motile, coelomic Gregarines (e.g. Cystobia, Diplodina and Diplocyclus), in the presence of segmentation, but in some cases even earlier. Woodcock (loc. cit.) has described and compared the different methods adopted to ensure a permanent union, and the degree of neogamy attained, in these forms. Here it must suffice to say that, in the extreme condition of neogamy, the union takes place very early in the life-history, between individuals which are little more than sporozoites, and is of a most intimate character, the actual cytoplasm of the two individuals being joined (fig. 12). In such cases, there is absolutely nothing to indicate the "double nature of the growing trophozoite, but the presence of the two nuclei which remain quite distinct.

There can be little doubt that, in the great majority, if not in all Gregarines, association is necessary for subsequent sporation to take place; i.e. that the cytotactic attraction imparts a developmental stimulus to both partners, which is requisite for the formation of primordial sporoblasts (gametes). This association is usually permanent; but in one or two cases (perhaps Gonospora) temporary association may suffice.

While association is fundamentally a reproductive (sexual) phenomenon, in some cases, this function may be delayed. A chain of five parasites; ρ, Primate; s, or, as it were, temporarily Satellites, suspended, the cytotactic attraction serving merely a subsidiary purpose in trophic life. Usually, however, we find the curious multiple associations and long chains of Gregarines (fig. 11) sometimes met with (e.g. Eirmocystis, Clepsydrina).

Encystment is nearly always double, i.e. of an associated couple. Solitary encystment has been described, but whether successful independent sporulation results, is uncertain; if it does, the encystment in such cases is, in all probability, only after prior (temporary) association. In the case of free parasites, a well-developed cyst is secreted by the zyzygy, which rotates and gradually becomes spherical. A thick, first gelatinous, outer cyst-membrane (eilectis) is laid down, and then a thin, but firm internal one (endoectis), which has been formed by the host, and, in fact, often proceeds outside it. In certain coelomic Gregarines, on the other hand, which remain in very close relation with the host's tissues, little or nothing of an encystment-process on the part of the parasites is recognizable, the cyst-wall being formed by an enclosing layer of the host (Diplodina).

The nuclear changes and multiplication which precede sporoblast-formation vary greatly in different Gregarines and can only be included here. In the formation of both sets of sexual elements (gametes) there is always a comprehensive nuclear purification and maturation. This elimination of a part of the nuclear material (to be distinguished as trophic or somatic, from the functional or germinal portion, which forms the new nuclei) may occur at widely different times and at different periods. In some cases (Lankesteria, Monocystis), a large part of the original (sporont-) nucleus of each associate is at once got rid of, and the resulting (segmentation-) nucleus, which is highly-specialized, represents the sexual part. In other cases, again, the entire sporont-nucleus proceeds to division, and the nuclear changes become manifest only after nuclear multiplication has continued for some little time, when certain of the daughter-nuclei become altered in character, and ultimately degenerate, the remainder giving rise to the sporoblast-nuclei (Diplodina, Stylospora). Even after the actual sporoblasts (sex-cells) themselves are constituted, their nuclei may yet undergo a final maturation (e.g. Cystobia, monata); and in Monocystis, indeed, Brasil (2) finds what is apparently a similar process is delayed until after conjugation and formation of the zygote (definitive sporoblast).

Nuclear multiplication is usually indirect, the mitosis being as a...
GREGARINES

559

rule, more elaborate in the earlier than in the later divisions. The attraction-spheres are generally large and conspicuous, sometimes consisting of a well-developed centrosphere, with or without centrosome granules, at other times of very large centrosomes with a few astral rays. In those cases where the karyosome is retained, and the sporoblast-nucleus divides up as a whole, however, the earliest nuclear divisions are direct; the daughter-nuclei being formed either by a process of simple constriction (e.g. Diplodina); or by a kind of multiple fission or fragmentation (Gregarina and Solenidium spp.). Nevertheless, the later divisions, at any rate in Diplodina, are indirect.

By the time nuclear multiplication is well advanced or completed, the bodies of the two parent-Gregarines (associates) have usually become very irregular in shape, and produced into numerous lobes and processes. While in some forms (e.g. Monocystis, Urospora, Stylorhynchus) the two individuals remain fairly separate and independent of each other, in others (Lankesteria) they become inter-twined and interlocked, often to a remarkable extent (Diplodina). The sexual nuclei next pass to the surface of the processes and segments, where they take up a position of uniform distribution. Around each, a small area of cytoplasm becomes segregated, the whole often projecting as a little bud or hillock from the general surface. These uninuclear protoblasts are at length cut off as the sporoblasts or gametes. Frequently a large amount of the general protoplasm of each parent-individual is left over unused, constituting two cystal residua, which may subsequently fuse; in Diplodina, however, practically the whole cytoplasm is used up in the formation of the gametes.

The sporoblasts themselves show all gradations from a condition of marked differentiation into male and female (anisogamy), to one of complete equality (isogamy). Anisogamy is most highly developed in Pterocephalus. Here, the male elements (microgametes) are minute, elongated and spindle-like in shape, with a minute rostrum anteriorly and a long flagellum posteriorly, and very active; the female elements (macrogametes) are much larger, oblong, to ovoid, and quite passive. In Stylorhynchus the difference between the conjugating gametes is not quite so pronounced (fig. 13), the male elements being of about the same bulk as the females, but pyriform.

The conjugating male elements are attached by a single, usually quite long, thread-like continuity to the female elements. In Diplodina, the male elements are attached to the female body, while in the other forms they are attached close to it.

The male elements may divide by a simple constriction, or by the formation of a /double/ processes, degenerating by the formation of a /double/ processes, degenerating into the male. In Diplodina, the male elements are attached to the female body, while in the other forms they are attached close to it.

The male and female elements come to lie close to each other, often to such an extent that they are difficult to distinguish one from another. In some cases, the male elements are larger and more active than the female elements, while in others the female elements are larger and more active than the male elements. In Diplodina, the male elements are attached to the female body, while in the other forms they are attached close to it.

The male and female elements come to lie close to each other, often to such an extent that they are difficult to distinguish one from another. In some cases, the male elements are larger and more active than the female elements, while in others the female elements are larger and more active than the male elements. In Diplodina, the male elements are attached to the female body, while in the other forms they are attached close to it.
The chief families, with representative genera, are as follows: Porosporaide, with Porospora gigantea, at present thought to be gymnospores; Gregarinae (Clepsydrinae), with Gregarina, Clepsydra, Eirmycystis, Hyalospora, Coniodora, Sierophora; Diplocystidae, with Diplocystis, Lophocephalus, Pterocephalus, Cystidium, Ectoplastrum, Euryamoeba; Aseptatae, with Actinocystis, Protista, and Actinoceps. Gregarinae with Actinocystis, Pyramia, Colerhychnus, Stephanocephala, Legeria. Siccotera, Filarocystes, Schizolophocystis; Acanthocephalae with Acanthocystis; Diplocystidae, with Lophocephala, Diploceps; Tolvocystidae with Toiloxystis; and Taeniocystidae with Taeniocystis. The curious genus Selenidium is somewhat apart.

The body never possesses an epimere and is non-septate. Chiefly coccodom parasites of "worms," Holothurians and insects. The Aseptatae have not been so completely arranged in families as the Sepiaetidae. Leger has distinguished two well-marked ones, but the remaining genera still remain classless in nomenclature. Gregarines, with Gonospora, Diploida and Urospora, and Diplod遵义形, with Urospora, Cystobolus, Lithocystis, Ceraspora; the genera Monocystis, Diplocystis, Lankestheria and Zygocystis probably constitute another; Porospora and, again, Syncystis are distinct; lastly, certain forms, e.g., Zygosoma, Anchora (Anchorina), are incompletely known.

There remains for mention the remarkable parasite, previously described by J. Nussbaum (24) under the appropriate name of Schaudinnella henleae, which inhabits the intestine of Henlea lepoldera. Briefly enumerated, the principal features in the life-cycle are as follows: the young spores (asexual) are attached to the intestinal cells, but practically everything else is very primitive in character and indiscriminate; it takes place indifferently between individuals which will give rise to gametocytes of the opposite sex. In the case of this species, which is a parasite of the sea anemone, it is possible, several adults becoming more or less enclosed in a gelatinous investment. Nevertheless, in no case does true encystment occur, the sexes being developed practically free. The female gametes are large and egg-like, the males, minute, sickle-like, but with no flagellum and apparently non-motile. While many of the zygoetes ("amphions") resulting from copulation pass out to the exterior, to be fertilized in the water, others, possessing a delicate investing-membrane, penetrate in between the intestinal cells, producing a further infection (auto-infection). Numerous sporozoites are formed in each zygoete. It will be seen that Schaudinnella has characteristics derived from both Porospora and Actinocystis, from which it recalls the Gregarines in many ways, on the other hand it differs widely from them in several characteristic features, being primitive in some respects, but highly specialized in others, so that it cannot be properly included in the former. Schaudinnella rather represents a primitive Ectosporoan parasite, which has proceeded upon a line of its own, intermediate between the Gregarines and Cordicida.

On the establishment of the new constitution, Grégoire was elected to the Council of 500, and after the 18th Brumaire he became a member of the Corps Législatif, then of the Senate (1801). He took the lead in the national church councils of 1797 and 1801; but he was the most vigorously opposed to Napoleon's policy of reconciliation with the Holy See, and after the departure of the concordat he resigned his bishopric (October 8, 1801). He was one of the minority of five in the Senate who voted against the proclamation of the empire, and he opposed the creation of the new nobility and the divorce of Napoleon from Josephine; but notwithstanding this he was subsequently created a count of the empire and officer of the Legion of Honour. During the later years of Napoleon's reign he travelled in England and Germany, but in 1814 he had returned to France and was one of the chief instigators of the action that was taken against the empire.

To the clerical and ultra-royalist faction which was supreme in the Lower Chamber and in the circles of the court after the second Restoration, Grégoire, as a revolutionist and a schismatic bishop, was an object of double loathing. He was expelled from the Institute and forced into retirement. But even in this period of headlong reaction his influence was felt and feared. In 1814 he had published a work, De la constitution française de l'an 1814, in which he commented on the Charter from a Liberal point of view, and this reached its fourth edition in 1816. In this latter year he was elected to the Lower Chamber, as the representative of Isère. By the powers of the Quadruple Alliance this event was regarded as of the most sinister omen, and the question was even raised of a fresh armed intervention in France under the terms of the secret treaty of Aix-la-Chapelle. To prevent such a catastrophe Louis XVIII. decided on a modification of the franchise; the Dessolle ministry resigned; and the first act of Decazes, the new premier, was to carry a vote in the chamber annulizing the election of Grégoire. From this time onward the archbishop lived in retirement, occupying himself in literary pursuits and in correspondence which extended over most parts of Europe; but as he had been deprived of his pension as a senator he was compelled to sell his library to obtain means of support. He died on the 20th of May 1831.

To the last Grégoire remained a devout Catholic, exactly fulfilling all his obligations as a Christian and a priest; but he refused to budge an inch from his revolutionary principles. During his last illness he confessed to his parish curé, a priest of Jansenist sympathies, and expressed his desire for the last sacrament of the Church. The archbishop of Paris would only concede on condition that he would retract his oath to the civil constitution of the clergy, which he peremptorily refused to do. Thereupon, in defiance of the archbishop, the abbé Baradère gave him the viaticum, while the rite of extreme unction was administered by the abbé Guillou, an opponent of the civil constitution, without consulting the archbishop or the curé paré. The attitude of the archbishop roused great excitement in Paris, and the government had to take precautions to avoid a repetition of the riots which in the preceding February had led to the sacking of the church of St Germain l'Auxerrois and the archiepiscopal palace. On the day after his death Grégoire's funeral was celebrated at the church of the Abbaye-aux-Bois; the clergy of the church had absented themselves in obedience to the archbishop's orders, but mass was sung by the abbé Griou assisted by two clergy, the catafalque being decorated with the episcopal insignia. After the hearse set out from the church the horses were unyoked, and it was dragged by students to the cemetery of Montparnasse, the cortège being followed by a sympathetic crowd of some 20,000 people.

Whatever his merits as a writer or as a philanthropist, Grégoire's name lives in history mainly by reason of his whole-hearted effort to prove that Catholic Christianity is not reconcilable with modern conceptions of political liberty. In this effort he was defeated, mainly because the Revolution, for lack of experience in the right use of liberty, changed into a military despotism which allied itself with the spiritual despotism of Rome; partly because, when the Revolution was overthrown,
GREGORAS—GREGORY, ST.

the parties of reaction sought salvation in the "union of altar and throne." Possibly Grégoire's Gallicanism was fundamentally ir reconcilable with the Catholic idea of authority. At least it made their traditional religion possible for those many French Catholics who clung passionately to the benefits the Revolution had brought them; and had it prevailed, it might have spared France the keepers of the false gulf between Liberalism and Catholicism which Pius IX.'s Syllabus of 1864 sought to make impassable.

Besides several political pamphlets, Grégoire was the author of Histoire des sectes religieuses, après le commencement du siècle dernier jusqu'à l'époque actuelle (2 vols., 1810); Essai historique sur les Églises de l'Église (1819); L'Influence du Christianisme sur la condition des femmes (1821); Histoire des confesseurs des empereurs des rois, et d'autres princes (1824); Histoire du mariage des prêtres en France (1826). Grégoirenoise, ou résumé général de la conduite, des actions, et des écrits de M. le Chartophylax Grégoire, preceded by a biographical notice by Cousin d'Avalon, was published in 1821; and the Mémoires... de Grégoire, with a biographical notice by H. Carnot, appeared in 1837 (2 vols.). See also A. Deblieur, L'Abbé Grégoire (1881); A. Gazier, Études sur l'histoire religieuse de la Révolution Française (1883); L. Maggiori, La Vie et les œuvres de l'Abbé Grégoire (Nancy, 1884), and numerous articles in La Revolutions, France, et E. Meinard, Étude historique et biographique sur les Lorrains révolutionnaires (Nancy, 1882), and A. Gazier, Études sur l'histoire religieuse de la Révolution Française (1887).

GREGORAS, NICEPHORUS (c. 1295-1360), Byzantine historian, man of learning and religious controversialist, was born at Heracleas in Pontus. At an early age he settled at Constantinople, where his reputation for learning brought him under the notice of Andronicus II., by whom he was appointed Grand Logothete, and took the archonship after the death of Grégoras. He was opposed (in a still extant treatise) certain reforms in the calendar, which the emperor refused to carry out for fear of disturbances; nearly two hundred years later they were introduced by Gregory XIII. on almost the same lines. When Andronicus was de-throned (1328) by his grandson Andronicus III., Grégoras shared his downfall and retired into private life. Attacked by Barlaam, the famous monk of Calabria, he was with difficulty persuaded to come forward and meet him in a war of words, in which Barlaam was worsted. This greatly enhanced his reputation and brought him a large number of pupils. Grégoras remained loyal to the elder Andronicus to the last, but after his death he succeeded in gaining the favour of his grandson, by whom he was appointed to conduct the unsuccessful negotiations (for a union of the Greek and Latin churches) with the ambassadors of Pope John XXII. (1333). Grégoras subsequently took an important part in the Hesychast controversy, in which he violently opposed Gregorius Palamas, the chief supporter of the sect. After the doctrines of Palamas had been recognized at the council of Lyons in 1341, Grégoras, who refused to acquiesce, was practically imprisoned at Nicomedia for five years. He is known of the end of his life. His chief work is his Roman History, in 37 books, of the years 1204 to 1559. It thus partly supplements and partly continues the work of George Pachymeres. Grégoras shows considerable industry, but his style is pompous and affected. Far too much space is devoted to religious matters and dogmatic quarelus. This work too that of John Cantacuzene supplement and correct each other, and should be read together. The other writings of Grégoras, which (with a few exceptions) still remain unpublished, attest his great versatility. Amongst them may be mentioned a history of the dispute with Palamas; biographies of his uncle and early instructor John, metropolitan of Heraclea, and of the martyr Cadukes of Antioch; funeral orations for Theodore Metochita, and the two emperors Andronicus; commentaries on the wanderings of Odyssues and on Synesius's treatises on dreams; tracts on orthography and on words of doubtful meaning; a philosophical dialogue called Florensius or Concerning Wisdom; and various other treatises on the date of Easter and the preparation of the astrolabe; and an extensive correspondence.

GREGOROVIAI, FERDINAND (1821-1891), German historian, was born at Neidenburg on the 19th of January 1821, and studied at the university of Königsberg. After spending some years in teaching he took up his residence in Italy in 1852, remaining in that country for over twenty years. He was made a citizen of Rome, and he died at Munich on the 1st of May 1891. Gregorovius's interest in and acquaintance with Italy and Italian history is mainly responsible for his great book, Geschichte der Stad Rom im Mittelalter (Stuttgart, 1855-1879, and other editions), a work of much erudition and interest, which has been translated into English by A. Hamilton (13 vols., 1894-1900), and also into Italian at the expense of the Romans (Venice, 1874-1876). It deals with the history of Rome from about A.D. 400 to the death of Pope Clement VII. in 1534, and in the words of its author it describes "how, from the time of Charles the Great to that of Charles V., the historic system of the papacy remained inseparable from that of the Empire." The other works of Gregorovius were, Geschichte des Kaisers Hadrian und seiner Zeit (Königsberg, 1851), English translation by M. E. Robinson (1898); Corsici (Stuttgart, 1854), English translation by R. Martineau (1855); Laica Borgia (Stuttgart, 1874), English translation by J. L. Garner (1904); Die Grabenkmäler der Päpste (Leipzig, 1881), English translation by R. W. Seton-Watson (1905); Wanderjahre in Italien (5 vols., Leipzig, 1888-1892); Geschichte der Stadt Athen im Mittelalter (1889); Kleine Schriften zur Geschichte der Kultur (Leipzig, 1887-1892); and Umriss des VI. im Widerspruch zu Sporn und dem Kaiser (Stuttgart, 1879). This last work was translated into Italian by the author himself (Rome, 1879). Gregorovius wrote also something of a poet; he wrote a drama, Der Tod des Thibetern (1851), and some Gedichte (Leipzig, 1891).

His Römische Tagebücher were edited by F. Althaus (Stuttgart, 1892), and were translated into English as the Roman Journals of F. Gregorovius, by A. Hamilton (1907).

GREGORY, ST. (c. 213-c. 270), surnamed in later ecclesiastical tradition Thaumaturgus (the miracle-worker), was born of noble and wealthy pagan parents at Neocaesarea in Pontus, about A.D. 213. His original name was Theodorus. He took up the study of civil law, and, with his brother Athenodoros, was on his way to Berytus to complete his training when at Caesarea he met Origen, and became his pupil and then his convert (A.D. 233). In returning to Cappadocia some five years after his conversion, it had been his original intention to live a retired ascetic life (Eus. H.E. vi. 30), but, urged by Origen, and at last almost compelled by Phaedimus of Amasia, his metropolitan, neither of whom was willing to see so much learning, piety and masculine energy practically lost to the church, he, after many attempts to evade the dignity, was consecrated bishop of his native city, Laodicea, and his episcopate, which lasted some thirty years, was characterized by great missionary zeal, and by so much success that, according to the (doubtless somewhat rhetorical) statement of Gregory of Nyssa, whereas at the outset of his labours there were only seventeen Christians in the city, there were at death seventy-one seniors in all who had not embraced Christianity. This result he achieved in spite of the Decian persecution (250-251), during which he had felt it to be his duty to absent himself (Eus. H.E. vii. 23), and the desolating effects of an irruption of barbarians (Goths and Boranians) who laid waste the diocese in A.D. 253-254. Gregory, although he has not always escaped the charge of Sabellianism, now holds an undisputed place among the fathers of the church; and although the turn of his mind was practical rather than speculative, he is known to have taken an energetic part in most of the doctrinal controversies of his time. He was active at the first synod of Antioch (A.D. 264-265), which investigated and condemned the heresies of Paul of Samosata; and the rapid spread in Pontus of a Trinitarianism approaching the Nicene type is attributed in large measure to the weight of his influence. Gregory is believed to have died in the reign of Aurelian, about the year 270, though perhaps an earlier date is more probable. His festival (semiduplex) is observed by the Roman Catholic Church on the 17th of November.
For the facts of his biography he gives an outline of his early years in eulogy on Origen, and incidental notices in the writings of the Fathers of Egypt. Jerome and Eusebius, Gregory and his trustworthy panegyric represents him as having wrought miracles of a very startling description; but nothing related by him comes near the astounding narratives given in the Martyrologies, or even in the homilies of Nazianzus himself.

The principal works of Gregory Thaumaturgus are the Panegyrici in Origenem (Eis Πάντας τα παντοτικά λόγια), which he wrote when on the point of leaving the school of that great master (it contains a valuable description of Origenes' system of instruction), the Metaphrasis in Eclesiastem, characterized by Jerome as "short but useful"; and an Epistolæ canonicae, which treats of the discipline to be observed by those Christians who had been suffering persecution and who had relapsed into paganism, but desired to be restored to the privileges of the Church. It gives a good picture of the conditions of the time, and shows Gregory to be a true shepherd (cf. art. PLENACE).

The question with which Gregory was now deeply occupied was the old one of the privileges and baptism of freeborn pagans, who had been converted to Christianity and received baptism, but not without a request for it to be continued. Gregory's answer was that they were not to be baptized, and if they were not baptized they were not members of the Church, but they were to be restrained from the forementioned privileges. This answer was given in a letter, and in the same time the entire church of Antioch was stirred up and made to decided on the point, and the Pope and the bishops were informed about this point, and the church of Antioch was made to agree with the Pope, and it was also desired by Gregory and tradition to have been received by him immediately in vision from the apostle John himself, is probably authentic. A sort of Platonic dialogues, a doubtful authenticity, "on the impassivity and the passivity of God" in Syria is in the British Museum.

Editions: Gerhard Voss (Mainz, 1604), Fronto Duciaius (Paris, 1622), Migae, Patr. Graec. x. 963.

GREGORY, ST. OF NAZIANZUS (329–389), surnamed Theologus, one of the four great fathers of the Eastern Church, was born about the year A.D. 329, at or near Nazianzus, Cappadocia. Nazianzus was the school of his infancy, and he also became bishop of the diocese; his mother, Nonna, exercised a powerful influence over the religious convictions of both father and son. Gregory visited successively the two Caesareas, Alexandria and Athens, as a student of grammar, mathematics, rhetoric and philosophy; at Athens he had for fellow-students Basil (q.v.), who afterwards became Bishop of Caesarea, and Julian, afterwards emperor. Shortly after his return to his father's house at Nazianzus (about the year 360) Gregory received baptism. He resolved to give himself to the service of religion; but for some time, and indeed more or less throughout his whole life, was in a state of hesitation as to the form which that service ought to take. Strongly inclined by nature and education to a contemplative life spent among books and in the society of congenial friends, he was continually urged by outward circumstances, as well as by an inward call, to active pastoral labour. The spirit of refined intellectual monasticism, which clung to him through life and never ceased to struggle for the ascendency, was about this time strongly encouraged by his intercourse with Basil, who induced him to share the exalted position in which his brother was placed in Pontus. His mind was engaged by the preparation of the Φωκαλαία, a sort of christomathy compiled by the two friends from the writings of Origen. But the events which were stirring the political and ecclesiastical life of Cappadocia, and indeed of the whole Roman world, made a career of learned leisure difficult if not impossible to a man of Gregory's position and temperament. The emperor Constantius, having by intrigue and intimidation succeeded in thrusting a semi-Arian formula upon the Western bishops assembled at Ariminum in Italy, had next attempted to follow the same course with the Eastern episcopate. The urge of his mind and the calls of Nazianzus having yielded to the imperial threats, a great storm arose among the monks of the diocese, which was only quelled by the influence of the younger Gregory, who shortly afterwards (about 361) was ordained to the priesthood. After a vain attempt to evade his new duties and responsibilities by flight, he appears to have continued to act as a presbyter in his father's diocese without interruption for some considerable time; and it is probable that his two Invective against Julian are to be assigned to this period. Subsequently (about 372), under a pressure which he somewhat resembles the choice of Hilarion — first nominated by Basil as bishop of Sasina, a miserable little village some 32 m. from Tyana; but he seems hardly, if at all, to have assumed the duties of this diocese, for after another interval of "flight" we find him once more (about 372–373) at Nazianzus, assisting his aged father, on whose death (374) he retired to Seleucia in Isauria for a period of some years. Meanwhile a more important field for his activities was opening up. Towards 378–379 the small and depressed remnant of the orthodox party in Constantinople sent him an urgent summons to undertake the task of resuscitating their cause, so long persecuted and borne down by the Arians of the capital. With the accession of Theodosius to the imperial throne in 379, the Nicene doctrine had dawned, if only it could find some courageous and devoted champions.

The fame of Gregory as a learned and eloquent disciple of Origen, and still more of Athanasius, pointed him out as such a defender; nor could he resist the appeal made to him, although he took the step reluctantly. Once arrived in Constantinople, he laboured so zealously and well that the orthodox party speedily gathered strength; and the small apartment in which they had been accustomed to meet was soon exchanged for a vast and celebrated church which received the significant name of Anastasia, the Church of the Resurrection, and where the hearers of Gregory were to be found, not only churchmen like Jerome and Evagrius, but also heretics and pagans; and it says much for the sound wisdom and practical tact of the preacher that he set himself less to build up and defend a doctrinal position than to urge his flock to the cultivation of the loving Christian spirit which cherishes higher aims than mere heresy hunting or endless disputation. Doctrinal, nevertheless, he was, as is abundantly shown by the famous five discourses on the Trinity, which earned for him the distinctive appellation of διδασκαλος. These orations are replete with the niceties of the Nicene orthodoxy, and the Trinity as conceived by the orthodox teachers of the East was directed especially against the Eunomians and Macedonians.

"There is perhaps no single book in Greek patristic literature to which the student who desires to gain an exact and comprehensive view of Greek theology can be more confidently referred." With the arrival of Theodosius in 380 came the visible triumph of the orthodox cause; the metropolitan see was then conferred upon Gregory, and after the assembling of the second ecumenical council in 381 he received consecration from Meletius. In consequence, however, of a spirit of discord and envy which had manifested itself in connexion with this promotion, he soon afterwards resigned his dignity and withdrew into comparative retirement. The rest of his days were spent partly at Nazianzus in ecclesiastical affairs, and partly on his neighbouring patrimonial estate at Arizianus, where he followed his favourite literary pursuits, especially poetical composition, until his death, which occurred in 390 or 392. His festival is celebrated in the Eastern Church on the 25th and 30th of January, in the Western on the 9th of May (duplex).

His extant works consist of poems, epistles and orations. The poems, which include epigrams, elegies and an autobiographical sketch, have been frequently printed, the edictus princeps being that of Aldine (1504). Other editions are those of Toliuss (1696) and Muratori (1709); a volume of Carmina selecta also has been edited by Deiss (1849). The tragedy entitled Ναυμισταῖον usually included is certainly not genuine. Gregory's poetry did not abate his best energies; it was adopted in his later years as a recreation rather than as a serious pursuit; thus it is occasionally delicate, graceful, and beautiful, but there is some fault in the composition, and they have passed into ecclesiastical use. The letters are entitled to a higher place in literature. They are always easy and natural; and there is nothing forced in the manner in which their acute, witty and profound sayings are introduced. Those to Basil introduce us to the story of a most romantic friendship, those to Cledonius have theological value for their bearing on the Apollinarian controversy. An orator he was so facile, vigorous and persuasive, that men forgot his small stature and emaciated countenance. Forty-five orations are extant. Gregory was less an independent theologian than an interpreter. He was influenced by Athanasius in his Christian orthodoxy, for whom his doctrine of sin and deriving human mortality from the Fall, he insists on the ability of the human will to choose the good and to co-operate in the work of salvation with the will of God. Though possessed neither of the gift of oratory, and Gregory's Nyssian power of speculative contemplative thought, he worthily takes a place in that triumvirate of Cappadocians whom the Catholic Church gratefully recognizes as having been, during the critical struggles in the latter half of the 4th century, the best defenders of its faith. The Opera omnia were
first published by Hervagius (Basel, 1550); the subsequent editions have been those of Billius (Paris, 1609, 1611; aucta ex interpretatione Morelli, 1630), of the Benedictines (begun in 1778, but interrupted by the French Revolution and not completed until 1840). Other editions are: The Sermons (ed. D. Legrand) (1757); The Dogmatic Orations (ed. by A. J. Mason) were published separately at Cambridge in 1899.

Several commentaries on the life of Gregory Nazianzen are to be found in the writings of Socrates, Sozomen, Theodoret and Rufinus, as well as in his own letters and poems. The data derived from these sources do not always harmonize with the account of Suidas. The earlier moderns, beginning with H. C. Witsius, have treated Gregory's life in a detached fashion. The more recent commentaries (editions of the works) by E. Urbain, C. M. de S. V. Exter, and L. Leslœ (Bib. Univ. t. xvii.), were used by Gibbon. See also C. Ullmann, Gregorius von Nazianz, der Theologe (1825; Eng. trans. by G. F. Cox, M.A., 1857); A. Benoît, St Grégoire de Nazianze; sa vie, ses ouvrages et son influence (1894); A. E. Halse, Questions historiques se rapprochant à St Grégoire de Nazianz (1879); F. W. Farrar, Lives of the Fathers, i. 491-582, and F. Loofs in Hauck-Herzog's Realencycl. für prot. Theologie, vii. 138.

GREGORY, ST. OF NYSSA (c. 334-c. 390), one of the four great fathers of the Eastern Church, designated by one of the later ecumenical councils as a "father of fathers," was a younger brother of Basil (the Great), bishop of Caesarea, and was born (prot. 1193) at the age of twelve for his help. He was chiefly indebted to his elder brother. At a comparatively early age he entered the church, and held for some time the office of anagost or reader; subsequently he manifested a desire to devote himself to the secular life as a rhetorician, an impulse which was checked by the earnest remonstrances of Gregory of Nazianzus. Finally, in 371 or 372 he was ordained by his brother Basil to the bishopric of Nyssae, a small town in Cappadocia. Here he is usually said (but on inadequate data) to have adopted the opinion then gaining ground in favour of the celibacy of the clergy, and to have separated from his wife Theosibia, who became a deaconess in the church. His strict orthodoxy on the subject of the Trinity and the Incarnation, together with his vigorous eloquence, combined to make him peculiarly obnoxious to the Arian faction, which was at that time in the ascendant through the protection of the emperor Valens; and in 375, the synod of Anycra, convened by Demetrius the Arian governor of Pontus, condemned him for alleged irregularities in his election and in the administration of the finances of his diocese. In 376 he was deprived of his see, and Valens sent him into exile, whence he did not return till the publication of the edict of Gratian in 378. Shortly afterwards he took part in the proceedings of the synod which met at Antioch in Caia, principally in connexion with the Meletian schism. At the great ecumenical council held at Constantinople in 381, he was a conspicuous champion of the orthodox faith; according to Nicephorus, indeed, the additions made to the Nicene creed were entirely due to his suggestion, but this statement is of doubtful authority. That his eloquence was highly appreciated is shown by the facts that he pronounced the discourse at the consecration of Gregory of Nazianzus, and that he was chosen to deliver the funeral oration on the death of Meletius the first president of the council. In the following year, moreover (382), he was commissioned by the council to inspect and set in order the churches of Arabia, in connexion with which mission he also visited Jerusalem. The impressions he gathered from this journey may, in part at least, be gathered from his famous letter De ewtonibus Hierosolyma, in which an opinion strongly unfavourable to pilgrimages is expressed. In 383 he was probably again in Constantinople; where in 385 he pronounced the funeral orations of the princess Pulcheria and afterwards of the empress Placilla. Once more we read of him in 394 as having been present in that metropolis at the synod held under the presidency of Nectarius to settle a controversy which had arisen among the bishops of Arabia; in the same year he assisted at the consecration of the new church of the apostles at Chalcidon, on which occasion there is reason to believe that his discourse commonly but wrongly known as the Eke rjwv wtporv was delivered. The exact date of his death is unknown; some authorities refer it to 376, others to 400. His festival is observed by the Greek Church on the 10th of January; in the Western martyrologies he is commemorated on the 9th of March.

GREGORY OF NYSSA—GREGORY OF TOURS

Gregory of Nyssa was not so firm and able an administrator as his brother Basil, nor so magnificent an orator as Gregory of Nazianzus, but he excelled them both, alike in erudition and constructive eloquence, and in the wide extent of his acquirements. His teaching, though strictly trinitarian, shows considerable freedom and originality of thought; in many points his mental and spiritual affinities with Origen show themselves with advantage, as in his doctrine of anaparastasis or final restoration. There are marked pantheistic tendencies, e.g., the inclusion of sin as a necessary part of the cosmic process, which make him akin to the pantheistic monophysites and to some modern thinkers.

His style has been frequently praised by competent authorities for its clearness and elegance. His name was often classified under five heads: (1) Treatises in doctrinal and polemical theology. Of these the most important is Against Eunomius in twelve books, a doctrinal thesis (which is supported with great philosophic acumen and rhetorical power) is the divinity and consubstantiality of the Word; incidentally the character of the Logos, which Eunomius had aspersed, is vindicated, and the heretic himself is held up to scorn and contempt. This is the work which, most probably in a shorter draft, was read by its author when at Constantinople before Gregory Nazianzus and Jerome in 381 (Jerome, De vir. ill. 128). To the same class belong the treatises On the Trinity, Against the Apollinarians; On Common Notions, in explanation of the terms in current employ- ment with regard to the Trinity; Ten Syllogisms, against the Manichaean; To Theodoret and to Gregory; On the Right Theohpse against the same; Against Fide, a disputation with a heathen philosopher; De anima et resurrectione, a dialogue with his dying sister Macrina; and the Oratio catholica magna, an argument for the inconstancy of the best possible form of redemption, intended to convince educated pagans and Jews. (2) Practical treatises. To this category belong the tracts On Virginity and On Pilgrimages; as also the Canonical Epistle upon the rules of penance. (3) Expository and homiletical works, including the Hexameron, and several series of discourses On the Workmanship of Man, On the Inscriptions of the Psalms, On the Sixth Psalm, On the first three Chapters of Ecclesiastes, On the Psalter, On the Beatitudes, etc. (4) Biographical, consisting chiefly of funeral orations. (5) Letters.

The only complete editions of the whole works are those by Fronton le Duc (Fronto Ducatus, Paris, 1615; with additions, 1618 and 1630); by Miguel de Unamuno (in five series, 1840, 1854, and 1861) containing the Explicatio apologetica in hexameron and De opificio hominis. Of the new edition projected by F. Oehler only the first volume, containing the Opera dogmatica, has appeared (1863). There have been numerous editions of several single treatises, as for example of the Oratio catholica (J. G. Krüger, ed. at Munich, and J. A. Crewe, ed. at Cambridge, 1903), De precatione and De anima et resurrectione.

See W. Farrar, Lives of the Fathers, ii. 56-83, the monograph by J. Rupp (Gregors, de Bis Nysa, 1856, 1867, and 1868); and compare P. Heyns (Disputation historico-theologica de Greg. Nysa, 1835). C. W. Möller (Gregorii Nys. doctrinae de hominis natu et iiustrasti et cum Origenismos comparati, 1854) and J. M. Rambaud (Die Philologie des Gregorius Nyssaeus, 2 vols., 1857), and many smaller monographs cited in Hauck-Herzog's Realencycl. für prot. Theol. vii. 149.

GREGORY, ST. OF TOURS (538-594), historian of the Franks, was born in the chief city of the Arverni (the modern Clermont- Ferrand) on the 30th of November 538. His real name was Georgius Florentius, Georgius being his grandfather's name and Florentius his father's. He was called Gregory after his maternal great-grandfather, the bishop of Langres. Gregory belonged to an illustrious senatorial family, many of whose members held high office in the church and bear honoured names in the history of Christianity. He was destined, it is said, from his early years to be a priest, for he was stamped with the impress of that dignity. Gregory was a skilled and learned man, who was a kinsman of Euphranius, bishop of Tours.

On the death of his father early, and his mother Armentaria settled in the kingdom of Burgundy on an estate belonging to her near Cavallon, where her son often visited her. Gregory was brought up at Clermont-Ferrand by his uncle Gallus and by his successor, Avitus, and there he received his education. Among the proclere authors he ranked highest six, in the life of Gallus's history of the Catilina conspiracy, but his education was mainly religious. The principles of religion he learnt from
the Bible, Sulpicius Severus and some lives of saints, but to patristic literature and the subtleties of theology he remained a stranger. In 563, at the age of twenty-five, he was ordained deacon. Falling seriously ill, he went to Tours to seek a cure at the tomb of St Martin. At Tours he lived with Euphronius, and so great was the young man’s popularity that, on the death of Euphronius in 573, the people unanimously designated him bishop.

At that time Tours belonged to Austrasia, and King Sigebert hastened to confirm Gregory’s election. After the assassination of Sigebert (575), the province was ruled by Chilperic for nine years, during which period Gregory wrote the great Annals of Austrasia in praise of the Frankish king. He had to contend with Count Leudast, the governor of Tours; despite all the king’s threats, he refused to give up Chilperic’s son Merovings, who had sought refuge from his father’s wrath at the sanctuary of St Martin; and he defended Bishop Pretextatus against Chilperic, by whom he had been condemned for celebrating the marriage of Merovech and Queen Brunhilda. In 580 Gregory was himself accused before a council at Berry of using abusive language against Queen Fredegond, but he cleared himself of the charge by an oath and a public letter. The death of Chilperic left Tours a see for two years (584–585) in the hands of Guntram, but when Guntram adopted his nephew Childerib, Sigebert’s son, it again became Austrasian. This change was welcome to Gregory, who often visited the court. In 586 he was at Coblenz, and on his return to Yvois (the modern Carignan) visited the styliste Wulfilaë; in 588 he hear of him at Metz and also at Chalon-sur-Saône, whither he was sent to obtain from King Guntram the ratification of the pact of Andelot; in 593 he was at Orleans, where Childerib had just succeeded his uncle Guntram. In the intervals of these journeys he governed Tours with great firmness, repressing disorders and reducing the monks and nuns to obedience. He died on the 17th of November 594.

Gregory left many writings, of which he himself gives an enumeration at the end of his Historia Francorum: “Decem libros Historiarum, septem Missarum, unum de Vita Patrum scrispi; in Psalmier tractat lapse unum commentatum sum; de Cursibus etiam ecclesiasticis unum librum condidi.” The ten books of history are discussed below. The seven books of miracles are divided into the De gloria martyrum, the De missis sancta martini, four books of Miracula sancti Martini, and the De gloria confessorum, the last dealing mainly with confessors who had dwelt in the cities of Tours and Clermont. The Vitae patrum consists of twenty biographies of bishops, abbots and hermits belonging to Gaul. The commentary on the Psalms is lost, the preface and the titles of the chapters alone being extant. The treatise De cursibus ecclesiasticis, discovered in 1853, is a liturgical manual for determining the hour of divers nocturnal offices by the position of the stars. Gregory also left a life of St Andrew, translated from the Greek, and a history of the Seven Sleepers of Ephesus, translated from Syriac.

His most important work, however, is the Historia Francorum, which is divided into three parts. The first four books, which were composed at one time, cover the period from the creation of the world to the death of Sigebert in 575. The first book, which is a mere compilation from the chronicles of St Jerome and Orosius, is of no value. The second book, from 397 to 511, deals with the invasions of the Franks, and is based on the histories of Sulpicius Alexander and Renatus Profuturus Frigeridus, now lost; on the catalogues of the bishops of Clermont and Tours; on some lives of saints, e.g. Remigius and Maxentius, now lost; on the annals of Arles and Narbonne, now lost; and on legends, either collected by Gregory himself from oral tradition, or cantilenae or epics written in the Latin and Germanic languages. In the third and fourth books the earlier part is based on materials collected from men older than himself; of the later events he was himself an eye-witness. The fifth and sixth books, up to the death of Chilperic (584), deal with matters within his own experience. The first six books are often separate in the MSS, and it was these alone that were used by the chronicler Fredegarius in his abridgment of Gregory’s history. To the first six books Gregory subsequently added chapters on the bishops Salonius and Sagittarius, and on his quarrels with Felix of Nantes. The authenticity of these chapters has been undeservedly attacked by Catholic writers. Books vii. to x., from 584 to 591, were written in the form of a diary; of each important event, as it occurred, he inserted an account in his book. The last six books are of great historical value.

Gregory had an intimate knowledge of contemporary events. He was frequently at court, and he found Tours an excellent place for collecting information. The shrine of St Martin attracted the sick from all quarters, and the basilica of the saint was a favourite sanctuary for the poor. Although Gregory remained in Paris for a short time, he was nearly always in the country, presiding over assemblies and political councils. Moreover, Tours was on the road between the north and south of France, and was a convenient stage for travellers, the ambassadors going to and from Spain frequently halting there. Gregory pried every one with questions, and in this way gathered a great mass of detailed information. He was, besides, at great pains to be an impartial writer, but was not always successful. His devotion to Austrasia made him very bitter against, and perhaps unjust to, the sovereigns of Neustria, Chilperic and Fredegond. As an orthodox Christian, he had no good word for the Saxons. Gregory’s biography of the two Frankish emperors, the church, such as Clovis, Clotaire I. and Guntram, had but no mercy for those who violated ecclesiastical privileges. This attitude, no doubt, explains his hatred for Chilperic. But if Gregory’s historical judgments are suspect, he at least concealed nothing and invented nothing; and we can correct his judgments by his own narrative. His history is a curious compound of artlessness and shrewdness. He was ignorant of the rules of grammar, confused genders and cases, and wrote in the vernacular Latin of his time, apart from certain passages which are especially elaborated and filled with poetical and elegant expressions. But the greater part of his work is well written, and the style accordingly attracts, and his mastery of the art of narrative has earned for him the name of the Herodotus of the barbarians.

GREGORY THE ILLUMINATOR, the reputed founder of the Armenian Church. His legend is briefly as follows. His father Anak, head of the Parthian clan of Suren, was bribed about the time of his birth (c. 257) by the Sassanian king of Persia to assassinate the Armenian king, Chosroes, who was of the old Arsacid dynasty, and father of Tiridates or Trdat, first Christian king of Armenia. Anak was slain by his victim’s soldiers; Gregory was rescued by his Christian nurse, carried to Caesarea in Cappadocia, and brought up a Christian. Grown to manhood he took service under Tiridates, now king of Armenia, in order by his own fidelity to atone for his father’s treachery. Presently at a feast of Anahté Gregory refused to assist his sovereign in offering pagan sacrifices, and his percentage being noted, was thrown into a deep pit at Arzoum, where he lay imprisoned for fourteen years, during which persecution raged in Armenia.

The scene of the legend now shifts to Rome, where Dioscorus falls in love with a lovely nun named Ripsimë; she, rather than gratify his passion, flees with her abess Gaiana and several priests to Armenia. Dioscorus asks her back of Tiridates, who meanwhile has fallen in love with her herself. He too is flouted, and in his rage tortures and slays her and her companions. The traditional date of this massacre is the 5th of October,
A.D. 301. Providence, incensed at such cruelty, turns Tiridates into a wild boar, and afflicts his subjects with madness; but his sister, Chosrowulkht, has a revelation to bring Gregory back out of his pit. The king consents, the saint is acclaimed, the bodies of the thirty-seven martyrs solemnly interred, and the king himself, after fasting five and listening to Gregory's homilies for sixty days, is healed. This all took place at Valarshapat, where Gregory, anxious to fix a site on which to build shrines for the relics of Ripsimé and Gaiana, saw the Son of God come down in a sheen of light, the stars of heaven attending, and smite the earth with a golden hammer till the nether world resounded to his blows. Three chapels were built on the spot, and Gregory raised his cross there and elsewhere for the people to worship, just as St Nino was doing about the same time in Georgia. There followed a campaign against the idols widespread, and books were destroyed. The time had now come for Gregory, who was still a layman and father of two sons, to receive ordination; so he went to Caesarea, where Leontius ordained and consecrated him catholicos or vicar-general of Armenia. This was sometime about 290, when Leontius may have acceded, though we first hear of him as bishop in 314.

Gregory's ordination at Caesarea is historical. The vision at Valarshapat was invented later by the Armenians when they broke with the Greeks, in order to give to their church the semblance, if not of apostolic, at least of divine origin.

According to Agathangelus, Tiridates went to Rome with Gregory, Aristaces, son of Gregory, and Albianos, head of the other priestly family, to make a pact with Constantine, newly converted to the faith, and receive a pallium from Silvester. The better sources make Sardica the scene of meeting and name Eusebius (of Nicomedia) as the prelate who attended Constantine. There is no reason to doubt that some such visit was made about the year 315, when the death of Maximin Daza left Constantine supreme. Eusebius testifies (H.E. ix. 8) that the Armenians were foremost Christians, and ancient and independent of the Roman empire when Maximin attacked them about the year 308. The conversion of Tiridates was probably a matter of policy. His kingdom was honeycombed with Christianity, and he wished to draw closer to the West, where he foresaw the victory of the new faith, in order to fortify his realm against the Sassanids of Persia. Following the same policy he sent Aristaces in 325 to the council of Nice. Gregory is related to have added a clause to the creed which Aristaces brought back; he became a hermit on Mount Sebuh about the year 332, and died there.

Is the Ripsimé episode mere legend? The story of the conversion of Georgia by St Nino in the same age is so full of local colour, and coheres so closely with the story of Ripsimé and Gaiana, that it seems over-sceptical to explain the latter away as a mere doublet of the legend of Prisca and Valeria. The historians Faustus of Byzant and Lazar of Pharp in the 5th century already attest the reverence with which their memory was invested. We know from many sources the prominence assigned to women prophets in the Phrygian church. Nino's story reads like that of such a female missionary, and something similar must underlie the story of her Armenian companions.

The history of Gregory by Agathangelus is a compilation of about 450, which was rendered into Greek 550. Professor Marr has lately published an Arabic text from a MS. in Sinai which seems to contain an older tradition. A letter of Bishop George of Arabia to Jeshu, a priest of the town Anah, dated 714 (edited by Dushian, Vienna, 1891), contains an independent tradition of Gregory, and styles him a Roman by birth. Over what precisely he meant or meant to imply we must still discern the true outlines and significance of his life. He did not really illumine or convert great Armenia, for the people were in the main already converted by Syrian missionaries to the Adoptionist or Ebonite type of faith which was dominant in the far East, and was afterwards known as Nestorianism. Marcionites and Montanists had also worked in the field. Gregory persuaded Tiridates to destroy the last relics of the old paganism, and carried out in the religious sphere his sovereign's policy of detaching Great Armenia from the Sassanid realm and allying it with the Graeco-Roman empire and civilization. He set himself to Hellenize or Catholicize Armenian Christianity, and in furtherance of this aim set up a hierarchy officially dependent on the Cappadocians.

He in effect turned his country into a province of the Greek, or rather of Cappadocia. This hierarchical tie was soon snapped, but the Hellenizing influence continued to work, and bore its most abundant fruit in the 4th century. His career was thus analogous to that of St Patrick in Ireland.

GREGORY (Gregorius), the name of sixteen popes and one antipope.

SAINT GREGORY, or, the "regionalist," a wealthy man of senatorial rank, owner of large estates in Sicily and of a palace on the Caelian Hill in Rome; his mother was Silvia, who is commemorated as a saint on the 3rd of November. Of Gregory's early period we know few details, and almost all the dates are conjectural. He received the best education to be had at the time, and was noted for proficiency in the liberal arts, and in letters. Entering on a public career he held, about 573, the high office of prefect of the city of Rome; but about 574, feeling irresistibly attracted to the "religious" life, he resigned his post, founded six monasteries in Sicily and one in Rome, and in the last—the famous monastery of St Andrew—became himself a monk. This grateful seclusion, however, he was not permitted long to enjoy. About 578 he was ordained "seventh deacon" (or possibly archdeacon) of the Roman Church, and in the following spring Pope Pelagius II. appointed him his official "apocrisarius," or secretary, to the papal embassy at Constantinople. Here he represented the interests of his church till about 586, when he returned to Rome and was made abbot of St Andrew's monastery. His rule, though popular, was characterized by great severity, as may be inferred from the story of the monk Justus, who was denied Christian burial because he had secreted a small sum of money. About this time Gregory completed and published his well-known exposition of the book of Job, commenced in Constantinople: he also delivered lectures on the Heptateuch, the books of Kings, the Prophets, the book of Proverbs and the Song of Songs. To this period, moreover, Bede's incident of the English slave-boys (if indeed it was accepted as historical) ought to be assigned. Passing one day through the Forum, Gregory saw some handsome slaves offered for sale, and inquired their nation. "Angles," was the reply. "Good," said the abbot, "they have the faces of angels, and should be cohers with the angels in heaven. From what province do they come?" "From Deira." "Deira. Yea, verily, they shall be saved from God's ire (de ira) and called to the mercy of Christ. How is the king of that country named?" "Ella." Thenmust Allelinu be sung in Allein's land." Gregory determined personally to undertake the conversion of Britain, and with the pope's consent actually set out upon the mission, but on the third day of his journey he was overtaken by messengers recalling him to Rome. In the year 590 Pelagius II. died of the plague that was raging in the city; whereupon the clergy and people unanimously chose Gregory as his successor. The abbot did his best to avoid the dignity, petitioned the emperor Maurice not
to ratify his election; and even medicated going into hiding; but, “while he was preparing for flight and concealment, he was seized and carried off and dragged to the basilica of St Peter,” and there consecrated bishop, on the 3rd of September 590.

The fourteen years of Gregory’s pontificate were marked by extraordinary vigour and activity. “He never rested,” writes a biographer, he was always engaged in providing for the interests of his people, or in writing some composition in search of the secrets of heaven by the grace of contemplation.” His mode of life was simple and ascetic in the extreme. Having banished all lay attendants from his palace, he surrounded himself with clerics and monks, with whom he lived as though he were still in a monastery. To the spiritual needs of his people he ministered with pastoral zeal, frequently appointing “stations” and delivering sermons; nor was he less solicitous in providing for their physical necessities. Deaconries (offices of alms) and guest-houses were liberally endowed, and free distributions of food were made to the poor in the convents and basilicas. The funds for these and similar purposes were supplied from the Patrimony of St Peter—the papal estates in Italy, the adjacent islands, Gaul, Dalmatia and Africa. These extensive domains were usually administered by specially appointed agents,—rectors and defensors,—who resided on the spot; but the general superintendence devolved upon the pope. In this sphere Gregory manifested rare capacity. He was one of the best of the papal landlords. During his pontificate the estates increased in value, while at the same time the opulent and legal revenues were lost to the church, and their whole position was materially improved. Gregory’s principal fault as a man of business was that he was inclined to be too lavish of his revenues. It is said that he even impoverished the treasury of the Roman Church by his unlimited charities.

Within the strict bounds of his patriarchate, i.e. the churches of the suburbanian provinces and the islands, it was Gregory’s policy to watch with particular care over the election and discipline of the bishops. With wise toleration he was willing to recognize local deviations from Roman usage (e.g. in the ritual of baptism and confirmation), yet he was resolute to withstand any unauthorized usurpation of rights and privileges. The following rules he took pains to enforce: that clerics in holy orders should not cohabit with their wives or permit any women, except those allowed by the canons, to live in their houses; that clerics accused on ecclesiastical or lesser criminal charges should be tried only in the ecclesiastical courts; that clerics in holy orders who had lapsed should “utterly forfeit their orders and never again approach the ministry of the altar”; that the revenues of each church should be divided by his bishop into four parts, and the general position was materially improved.

In his relations with the churches which lay outside the strict limits of his patriarchate, in northern Italy, Spain, Gaul, Africa and Illyricum and also in the East, Gregory consistently used his influence to increase the prestige and authority of the Roman See. In his view Rome, as the see of the Prince of the Apostles, was by divine right the head of all the churches. The decrees of councils would have no binding force “without the authority and consent of the apostolic see”; appeals might be made to Rome against the decrees of councils, even those of Constantinople: all bishops, including the patriarchs, if guilty of heresy or uncannonical proceedings, were subject to correction by the pope. “If any fault is discovered in a bishop,” Gregory wrote, “I know of no one who is not subject to the apostolic see.”

It is true that Gregory respected the rights of metropolitans and disapproved of unnecessary interference within the sphere of their jurisdiction canonically exercised; also that in his relations with certain churches (e.g. those in Africa) he found it expedient to abstain from any obtrusive assertion of Roman claims. But of his general principle there can be no doubt. His sincere belief in the apostolic authority of the see of St Peter, his outspoken assertion of it, the consistency and firmness with which in practice he maintained it (e.g. in his controversies with the bishops of Ravenna concerning the use of the pallium, with Maximus the “usurping” bishop of Salona, and with the patriarchs of Constantinople in respect of the title “ecumenical bishops”), contributed greatly to build up the system of papal absolutism. Moreover this consolidation of spiritual authority coincided with a remarkable development of the temporal power of the papacy. In Italy Gregory occupied an almost regal position. Taking advantage of the opportunities which circumstances offered, he boldly stepped into the place which the emperors had left vacant and the Lombard kings had not the strength to seize. For the first time in history the pope appeared as a political power, a temporal prince. He appointed governors to cities, issued orders to generals, provided munitions of war, sent his ambassadors to negotiate with the Lombard king and actually dared to conclude a private peace. In this direction Gregory went farther than any of his predecessors: he laid the foundation of a political influence which endured for centuries.

Of the medieval papacy, says Milman, “the real father is Gregory the Great.”

The first monk to become pope, Gregory was naturally a strong supporter of monasticism. He laid himself out to diffuse the system, and also to carry out a reform of its abuses by enforcing a strict observance of the Rule of St Benedict (of whom, it may be noted, he was the earliest biographer). Two slight innovations were introduced: the minimum age of an abbeys was fixed at sixty, and the period of novitiate was prolonged from one year to two. Gregory sought to protect the monks from the temporal power, and to punish those who abused the privileges of the monastic orders; he was never in restraint of abuses, in accordance with which the jurisdiction of the bishops over the monasteries was confined to spiritual matters, all illegal aggressions being strictly prohibited. The documents are interesting as marking the beginning of a revolution which eventually emancipated the monks altogether from the control of their diocesan and brought them under the direct authority of the Holy See. Moreover Gregory strictly forbade monks to minister in parish churches, ordaining that any monk who was promoted to such ecclesiastical cure should lose all rights in his monastery and should no longer reside there. “The duties of each office separately are so weighty that no one can rightly discharge them. It is therefore very improper that one man should be considered fit to discharge the duties of both, and that by this means the ecclesiastical order should interfere with the monastic life, and the rule of the monastic life in turn interfere with the interests of the churches.”

Once more, Gregory is remembered as a great organizer of missionary enterprise for the conversion of heathens and heretics. Most important was the two-fold mission to Britain—of St Augustine in 596, of Mellitus, Paulinus and others in 601; but Gregory’s efforts were not confined to the West. He extended them to Germany, Italy, Sicily, Sardinia and Corsica, Ariánism in Spain, Donatism in Africa, Manichaism in Sicily, the heresy of the Three Chapters in Istria and northern Italy. In respect of the methods of conversion which he advocated he was not less intolerant than his contemporaries. Towards the Jews, however, he acted with exceptional lenity, protecting them from persecution and securing them the enjoyment of their legal privileges. The so-called “Simoniacal heresy,” particularly prevalent in Gaul, Illyricum and the East, he repeatedly attacked; and against the Gallican opinion of promoting laymen to bishoprics he protested with vigour.

The extent and character of Gregory’s works in connexion with the liturgy and the music of the church is a subject of dispute. If we are to credit a 9th century biographer, Gregory abbreviated and otherwise simplified the Sacramentary of Gelasius, producing a revised edition with which his own name has become associated, and which represents the groundwork of the modern Roman Missal. But though it is certain that he introduced three changes in the liturgy itself (viz. the addition of some words in the prayer Hosanna lignum, the recitation of the Pater Noster at the end of the Canon immediately before the fraction of the bread, and the chanting of the Alleluia after the Gradual at other times besides the season of Easter) and two
others in the ceremonial connected therewith (forbidding deacons to perform any musical portion of the service except the chanting of the gospel, and subdeacons to wear chasubles), neither the external nor the internal evidence appears to warrant belief that the Gregorian Sacramentary is his work. Ecclesiastical tradition further ascribes to Gregory the compilation of an Antiphonary, the revision and rearrangement of the system of church music, and the foundation of the Roman schola cantorum. It is highly doubtful, however, whether he had anything to do either with the Antiphonary or with the introduction of the cantus planus; it is certain that he was not the founder of the Roman singing-school, though he may have interested himself in its endowment and extension.

Finally, as Fourth Doctor of the Latin Church, Gregory claims the attention of theologians. He is the link between two epochs. The last of the great Latin Fathers and the first representative of medieval Catholicism he brings the dogmatic theology of Tertullian, Ambrose and Augustine into relation with the Scholastic speculation of later ages. "He connects the Graeco-Roman with the Roman-Germanic type of Christianity." His teaching, indeed, is neither philosophical, systematic nor truly original. Its importance lies mainly in its simple, popular summarization of the doctrine of Augustine (whose works Gregory had studied with infinite care, but not always with insight), and in its detailed exposition of various religious conceptions which were current in the Western Church, but had not hitherto been defined with precision (e.g. the views on angelology and demonology, on purgatory, the Eucharistic Sacrifice, and the efficacy of relics). In his exposition of such ideas Gregory made a distinct advance upon the older theology, and influenced profoundly the dogmatic development of the future. He imparted a life and impulse to prevailing tendencies, helping on the construction of the system hereafter to be completed in Scholasticism. He gave to theology a tone and emphasis which could not be disregarded. From his time to that of Anselm no teacher of equal eminence arose in the Church.

Gregory died on the 12th of March 604, and was buried the same day in the portico of the basilica of St Peter, in front of the sacristry. Translations took place in the 9th, 15th and 17th centuries, and the remains now rest beneath the altar in the chapel of Clement VIII. In respect of his character, while most historians agree that he was a really great man, some deny that he was also a great saint. The worst blot on his fair fame is his adulatory congratulation of the murderous usurper Phocas; though his correspondence with the Frankish queen Brunhilda, and the series of letters to and concerning the renegade monk Venantius also present problems which his admirers find difficult of solution. But while it may be admitted that Gregory was inclined to flatteringly subordinate to the great, so that at times he was willing to shut his eyes to the vices and even the crimes of persons of rank; yet it cannot fairly be denied that his character as a whole was singularly noble and unselfish. His life was entirely dominated by the religious motive. His sole desire was to promote the glory of God and of his church. At all times he strove honestly to live up to the light that was in him. "His goal," says Lau, "was always that which he acknowledged as the best." Physically, Gregory was of medium height and good figure. His head was large and bald, surrounded with a fringe of hair. His face was strongly marked, with large, aquiline nose, thick and red lips, high-coloured cheeks, and prominent chin sparingly covered with a tawny beard. His hands, with tapering fingers, were remarkable for their beauty.

Gregory's Works.—The following are now universally admitted to be genuine:—Epistolae libri xix., Moralia libri xxxiv., Regulae pastoralis liber, Dialogorum libri iv., Homiliorum in Ezeshdom prophetam libri ii., Homiliorum in Evan geliem libri iv. All these are printed in the Patrologia Latina. The Epistole, however, have been published separately by P. Ewald and L. M. Hartmann in the Monumenta Germaniae historica (Berlin, 1867-1895). The last-named scholar has, in the main, succeeded all others. The question of the chronological reconstruction of the Register is dealt with by Ewald in his celebrated article in the Neues Archiv der Gesellschaft für ältere deutsche Geschichtskunde, iii. pp. 433-435; and briefly by A. Hodgkin, Italy and her Invaders, v. 333-343. For information about these writings of Gregory, consult especially G. J. T. Lau, Gregor I. der Große, pt. ii. chap. i. Die Schriften Gregory und F. Homes Dudden, Gregory the Great (see Index II. B.). In addition to the above-mentioned works there are printed under Gregory's name in Migne's Patrologia Latina, vol. lxxix, the following:—Super Cantico Canticorum expositio, in libros primum Regum et Cantica minorum et Eliae et Ezechiel expositio and Concordia quarundam testimoniorum i. scripturae. But (with the possible exception of the first) none of these treatises are of Gregorian authorship. See the discussions in Migne, Lau and Dudden.

AUTHORITIES.—(a) The principal ancient authorities for the life and works of Gregory are given in their chronological order. They are:—Gregory of Tours, Historiae Francorum, x. 1; Liber pontificia; Vita Gregorii Magni; Isidore of Seville, De vir. illust. 40, and Hdeonsus of Toledo, De vir. illust. i.; an anonymous Vita Gregorii (of English authorship) belonging to the monastery of St Gall; Diez, S. Gregor Reimach (1820); Ewalt, S. Gregorii Prophetae et Evangelistae; Migne, Patrologia Latina, t. i.; Bede, Historia ecclesiastica, i. 1.; Paul the Deacon, Vita Gregorii Magni (770-780); John the Deacon, Vita Gregorii (872-882). (b) Recent Literature:—J. Barmby, Gregory the Great (1892); T. Beumann, Gregor I. der Große, ein Lebensbild (1890); F. Homes Dudden, Gregory the Great: his place in History and Thought (2 vols., 1905); G. J. T. Lau, Gregor I. der Große nach seinem Leben und seiner Lehre geschildert (1845); C. Wolfgruber, Gregor der Große (1897). See also F. Gregorovius, Rome in the Middle Ages (Eng. trans.) ii. 16-103; T. Hodgkin, Italy and her Invaders, v. c. 7-10; H. K. Mann, Die Leben der Propheten des Judentums (1869); F. V. H. Corbin, Erotesis in die heiligen Schriften mit Be zug zu: L; P. L. P. Gervinus, Predigten des Gregor (1839); H. Wilmanns, Die wichtigsten Richtungen und Ziele der Tätigkeit des Propheten Gregor (1900); F. S. M. motor, Gregor der Große als literarischer Schriftsteller; E. G. P. Wyatt, St. Gregory and the Gregorianian Music; and the bibliographies of Gregory in Chevalier, Répertoire des sources historiques du moyen âge, and A. Potthast, Bibliotheca historica medii aevi. (F. H. D.)

Gregory II., pope from 755 to 731, succeeded Constantine I., whom he accompanied from Constantinople in 710. Gregory did all in his power to promote the spread of Christianity in Germany, and gave special encouragement to the mission of St Boniface, whom he consecrated bishop in 722. He was a staunch adherent of the East Roman empire, which still exercised sovereignty over Rome, Ravenna and some other parts of Italy, and he impeded as far as possible the progress of the Lombards. About 726, however, he became involved in a conflict with the emperor Leo the Isaurian on account of the excessive taxation of the Italians, and, later, on the question of image worship, which had been proscribed by the government of Constantinople. Leo endeavoured to rid himself of the pope by violence, but Gregory, supported by the people of Rome and also by the Lombards, succeeded in eluding the emperor's attacks, and died peacefully on the 11th of February 731.

Gregory III., pope from 731 to 741. He condemned the Iconoclasts at a council convened at Rome in November 731, and, like his predecessor Gregory II., stimulated the missionary labours of St Boniface, on whom he conferred the pallium. Towards the Lombards he took up an imprecisely attitude, in support of which he in vain invoked the aid of the Frankish prince Charles Martel.

Gregory IV., pope from 827 to 844, was chosen to succeed Valentine in December 827, on which occasion he recognized the supremacy of the Frankish emperor in the most unequivocal manner. His name is chiefly associated with the quarrels between Lothair and Louis the Pious, in which he espoused the cause of the former, for whom, in the Campus Mendoacii, the Pontiff is said to have exclaimed (835), he secured by his treachery a temporary advantage. The institution of the feast of All Saints is usually attributed to this pope. He died on the 25th of January 844, and was succeeded by Sergius II.

Gregory V. (Bruno), pope from 996 to 999, a great-grandson of the emperor Otto the Great, succeeded John XV. when only twenty-four years of age, and until the council of Pavia (997) had a rival in the person of the anti-pope John XVI., whom the people of Rome, in revolt against the will of the youthful emperor Otto III., had chosen after having expulsed from the Lateran the anti-pope, and restored those arising out of the contumacy of the French king, Robert, who was ultimately brought to submission by the rigorous infliction of a sentence
of excommunion. Gregory died suddenly, and not without suspicion of foul play, on the 18th of February 999. His successor was Silvester II.

GREGORY VI., pope from 1045 to 1046. As Johannes Gratianus he had earned a high reputation for learning and probity, and in 1043 he bought the Roman pontificate from his godson Benedict IX. on a condition that the Romans as their envoy in the Curia in 1046, he was accused of simony and deposed. He was banished into Germany, where he died in 1047. He was accompanied into exile by his young protégé Hildebrand (afterwards pope as Gregory VII.), and was succeeded by Clement II. (L. D. *)

GREGORY VII., pope from 1073 to 1085. Hildebrand (the future pope) would seem to have been born in Tuscany—perhaps Raovacum—early in the third decade of the 11th century. The son of a plain citizen, Bunicus or Bonizo, he came to Rome at an early age for his education; an uncle of his being abbot of the convent of St Mary on; but his entry into the convent must have included the archpriest Johannes Gratianus, who, by disbursing a considerable sum to Benedict IX., smoothed his way to the papal throne and actually ascended it as Gregory VI. But when the emperor Henry III., on his expedition to Rome (1046), terminated the scandalous impasse in which three popes laid claim to the chair of Peter by deposing all three, Gregory VI. was banished to Germany, and Hildebrand found himself obliged to accompany him. As he himself afterwards admitted, it was with extreme reluctance that he crossed the Alps. But his residence in Germany was of great educational value, and full of political influence. In Cologne he was enabled to pursue his studies; he came into touch with the circles of Lorraine where interest in the elevation of the Church and her life was highest, and gained acquaintance with the political and ecclesiastical circumstances of that country which was destined to figure so largely in his career. Whether, on the death of Gregory VI. in the beginning of 1048, Hildebrand proceeded to Cluny is doubtful. His brief residence there, if it actually occurred, is to be regarded as no more than a visit; for he was never a monk of Cluny. His contemporaries indeed describe him as a monk; but his entry into the convent must have been assigned to the period preceding or following his German travels and presumably took place in Rome. He returned to that city with Bishop Bruno of Toulu, who was nominated pope under the title of Leo IX. (1048-1054). Under him Hildebrand found his first employment in the ecclesiastical service, becoming a sub-deacon and steward in the Roman Church. He acted, moreover, as a legate in France, where he was occupied inter alia with the question of Berengarius of Tours, whose views on the Lord's Supper had excited opposition. On the death of Leo IX. he was commissioned by the pope to proceed to the court, to conduct the negotiations with regard to his successor. The emperor pronounced in favour of Bishop Gebhard of Eichstädt, who, in the course of his short reign as Victor II. (1055-1057), again employed Hildebrand as his legate to France. When Stephen IX. (Frederick of Lorraine) was raised to the papacy, without previous consultation with the German court, Hildebrand and Bishop Anselm of Lucca were despatched to Germany to secure a belated recognition, and he succeeded in gaining the consent of the empress Agnes. Stephen, however, died at Hiennheim, and, by the hasty elevation of Bishop Johannes of Velletri, the Roman nobility had a last attempt to recover their lost influence on the appointment to the papal throne—a proceeding which was charged with peril to the Church as it implied a renewal of the disastrous patrician régime. That the crisis was surmounted was essentially the work of Hildebrand. To Benedict X., the aristocratic nominee, he opposed a rival pope in the person of Bishop Gerhard of Florence, with whom the victory rested. The reign of Nicholas II. (1059-1061) was distinguished by events which exercised a potent influence on the policy of the Curia during the next two decades—the rapprochement with the Normans in the south of Italy, and the alliance with the democratic and, subsequently, anti-German movement of the Patarenes in the north. It was also under his pontificate(1059) that the law was enacted which transferred the

papal election to the College of Cardinals, thus withdrawing it from the nobility and populace of Rome and thrusting the German influence on one side. It would be too much to maintain that these measures were due to Hildebrand alone, but it is obvious that he was already a dominant personality on the Curia, through his reputation as the exiled pope. His position was indeed further confirmed when Nicholas II. died and a new schism broke out, the discomfiture of Honorius II. (Bishop Cadalus of Parma) and the success of his rival (Anselm of Lucca) was ascribed principally, if not entirely, to Hildebrand's opposition to the former. Under the sway of Alexander II. (1061-1073) this man loomed larger and larger in the eye of his contemporaries as the soul of the Curial policy. It must be confessed the general political conditions, especially in Germany, were at that period exceptionally favourable to the Curia, but to utilize them with the sagacity actually shown was done so far as to produce a pretender to the chair, his long and undisputed possession tended to prove the original legality of his papacy; and the appeal to irregularities at its beginning not only lost all cogency but assumed the appearance of a mere biased attack. On the 22nd of May he received sacerdotal ordination, and on the 30th of June episcopal consecration; the empress Agnes and the duchess Beatrice of Tuscany being present at the ceremony, in addition to Bishop Gregory of Vercelli, the chancellor of the German king, to whom Gregory thus seemed to have communicated the result of the debate.

The focus of the ecclesiastico-political projects of Gregory VII. is to be found in his relationship with Germany. Since the death of Henry III. the strength of the monarchy in that country had been seriously impaired, and his son Henry IV. had to contend with great internal difficulties. This state of affairs was of material assistance to the pope. His advantage was still further accentuated by the fact that in 1073 Henry was but twenty-three years of age and by temperament inclined to precipitate action. Many sharp lessons were needful before he learned to bridle his impetuousity, and he lacked the support and advice of a disinterested friend and confidant. Such being the conditions, a conflict between Gregory VII. and Henry IV. could have only one issue—the victory of the former.

In the two following years Henry was compelled by the Saxon rebellion to come to amicable terms with the pope at any cost. Consequently in May 1074 he did penance at Nuremberg in presence of the legates to expiate his continued intimacy with the members of his council banned by Gregory, took an oath of obedience, and promised his support in the work of reforming the Church. This attitude, however, which at first won him the confidence of the pope, he abandoned as soon as he gained the upper hand of the Saxons: this he achieved by his victory at Hohenburg on the Unstrut (June 9, 1075). He now attempted to reassess his rights of suzerain in upper Italy without delay.
He sent Count Eberhard to Lombardy to combat the Patarezis; nominated the clerk Tedaldo to the archbishopric of Milan, thus settling a prolonged and contentious question; and finally endeavoured to establish relations with the Norman duke, Robert Guiscard. Gregory VII. answered with a rough letter, dated December 8, in which—among other charges—he reproached the German king with breach of his word and with his further countenance of the excommunicated counselors; while at the same time he sent by word of mouth a brusque message intimating that the enormous crimes which would be laid to his account rendered him incapable of being the object of the church, but to the deprivation of his crown. Gregory ventured on these audacious measures at a time when he himself was confronted by a reckless opponent in the person of Cencius, who, on Christmas-night did not scruple to surprise him in church and carry him off as a prisoner, though on the following day he was obliged to surrender his captive. The reprimands of the pope, couched as they were in such an unprecedented form, infuriated Henry and his court, and their answer was the hastily convened national council in Worms, which met on the 24th of October, 1076. By the higher rank of the clergy, Gregory had many enemies, and a Roman cardinal, Hugo Candidus, once on intimate terms with him but now at variance, had made a hurried expedition to Germany for the occasion and appeared at Worms with the rest. All the gross scandals with regard to the pontiff that this prelate could utter were greedily received by the assembly, which committed itself to the ill-considered and disastrous resolution that Gregory had forfeited his papal dignity. In a document full of accusations the bishops renounced their allegiance. In another King Henry pronounced him deposed, and the Romans were required to choose a new occupant for the vacant chair of St. Peter. With the utmost haste two bishops were despatched to Italy in company with Count Eberhard under commission of the council, and they succeeded in procuring a similar act of deposition from the Lombard bishops in the synod of Piacenza. The communication of these decisions to the pope was undertaken by the priest Roland of Parma, and he was fortunate enough to gain an opportunity for speech in the synod, which had barely assembled in the Lateran church, and there to deliver his message announcing the dethronement of the pontiff. For the moment the members were petrified with horror, but soon such a storm of indignation was aroused that it was only due to the moderation of Gregory himself that the envoy was not cut down on the spot. On the following day the pope pronounced the sentence of excommunication against the German king with all formal solemnity, divested him of his royal dignity and absolved his subjects from the oaths they had sworn to him. This sentence purposed to eject the king from the church and to strip him of his crown. Whether it would produce this effect, or whether it would remain an idle threat, depended not on the author of the verdict, but on the subjects of Henry—before all, on the German princes. We know from contemporary evidence that the excommunication of the king made a profound impression both in Germany and Italy. Thirty years before, Henry III. had deposed three popes, and thereby rendered a great and acknowledged service to the church. When Henry IV. attempted to copy this summary procedure he came to grief, for he lacked the support of the people. In Germany there was a speedy and general revulsion of sentiment in favour of Gregory, and the particularism of the princes utilized the auspicious moment for prosecuting their anti-regal policy under the cloak of respect for the papal decision. When at Whitsuntide the king proposed to discuss the measures to be taken against Gregory in a council of his nobles at Mainz, only a few made their appearance; the Saxons snatched at the golden opportunity for renewing their insurrection and the anti-royalist party grew in strength from month to month. The situation now became extremely critical for Henry. As a result of the agitation, which was zealously fostered by the papal legate Bishop Turpin, his power in the pope's court was shaken sufficiently to elect a new German king, and Henry, who was stationed at Oppenheim on the left bank of the Rhine, was only saved from the loss of his sceptre by the failure of the assembled princes to agree on the question of his successor. Their dissenion, however, merely induced them to postpone the verdict. Henry, they declared, must make reparation to the pope and pledge himself to obedience; and they settled that, if, on the anniversary of his excommunication, he still lay under the ban, the throne should be considered vacant. At the same time they determined to invite Gregory to Augsburg, there to decide the conflict. These arrangements showed Henry the course to be purused. It was imperative, under any circumstances and at any cost, to secure his absolution from Gregory before the period named, otherwise he could scarcely foil his opponents in their intention to pursue their attack against himself and justify their measures by an appeal to his excommunication. At first he attempted to attain his ends by an embassy, but when Gregory rejected his overtures he took the celebrated step of going to Italy in person. The pope had already left Rome, and had intimated to the German princes that he would expect their escort for his journey on January 8 in Mantua. But this escort had not appeared when he received the news of the king's arbitrary measures. Gregory, who had already greeted with wild enthusiasm by the Lombards, but resisted the temptation to employ force against Gregory. He chose instead the unexpected and unusual, but, as events proved, the safest course, and determined to compel the pope to grant him absolution by doing penance before him at Canossa, where he had taken refuge. This occurrence was quickly embellished and inwoven by legend, and great uncertainty still prevails with regard to several important points. The reconciliation was only effected after prolonged negotiation, and definite pledges on the part of the king, and it was with reluctance that Gregory at length gave way, for, if he conferred his absolution, the dict of princes in Augsburg, in which he might reasonably hope to act as arbitrator, would either be rendered purposeless, or, if it met at all, would wear an entirely different character. It was impossible, however, to deny the penitent re-entrance into the church, and the politician had in this case to be subordinated to the priest. Still the removal of the ban did not imply a genuine reconciliation, and no basis was gained for a settlement of the great questions at issue—notably that of investiture. A new conflict was indeed inevitable from the very fact that Henry IV. naturally considered the sentence of deposition repealed with that of excommunication; while Gregory on the other hand, intent on preserving his freedom of action, gave no hint on the subject at Canossa.

That the excommunication of Henry IV. was simply a pretext—not a motive—for the opposition of the rebellious German nobles is manifest. For not only did they persist in their policy after his absolution, but they took the more decided step of setting up a rival king in the person of Duke Rudolph of Swabia (Forchheim, March 1077). At the election the papal legates present observed the appearance of neutrality, and Gregory himself sought to maintain this attitude during the following years. His task was the easier in that the two parties were of fairly equal strength, each endeavouring to gain the upper hand by the accession of the pope to their side. But his hopes and labours, with the object of receiving an appeal to act as arbitrator in the dynastic strife, were fruitless, and the result of his non-committal policy was that he forfeited in large measure the confidence of both parties. Finally he decided for Rudolph of Swabia in consequence of his victory at Flarchheim (January 27, 1080). Under pressure from the Saxons, and misinformed as to the significance of this battle, Gregory abandoned his waiting policy and again pronounced the excommunication and deposition of King Henry (March 7, 1080), unloosing at the same time all oaths sworn to him in the past or the future. But the papal censure now proved a very different thing from the papal censure four years previously. In wide circles it was felt to be an injustice, and men began to put the question—so dangerous to the prestige of the pope—whether an excommunication pronounced on frigrous grounds was entitled to respect. To make matters worse, Rudolph of Swabia died on the 16th of October of the
same year. True, a new claimant—Hermann of Luxemburg—was put forward in August 1081, but his personality was ill adapted for a leader of the Gregorian party in Germany, and the power of Henry IV. was in the ascendant. The king, who had been schooled by experience, took up the struggle thus forced upon him with great vigour. He refused to acknowledge the ban on the ground of illegality. A council had been summoned at Brixiën, and on the 25th of June 1080 it pronounced Gregory deposed and nominated the archbishop Guibert of Ravenna as his successor—a policy of anti-king, anti-pope. In 1081 Henry opened the conflict against Gregory in Italy. The latter had now fallen on evil days, and he lived to see thirteen cardinals desert him, Rome surrendered by the Romans to the German king, Guibert of Ravenna enthroned as Clement III. (1083–1099), and Henry crowned emperor by his rival, while he himself was constrained to flee from Rome.

The relations of Gregory to the remaining European states were powerfully influenced by his German policy; for Germany, by engrossing the bulk of his powers, not infrequently compelled him to show to other rulers that moderation and forbearance which he withheld from the German king. The attitude of the Normans brought him a rude awakening. The great concessions made to them under Nicholas II. were not only powerless to stem their advance into central Italy but failed to secure even the expected protection for the papacy. When Gregory was hard pressed by Henry IV., Robert Guiscard left him to his fate, and only interfered when he himself was menaced with the German arms. Then, on the capture of Rome, he abandoned the city to the tender mercies of his warriors, and by the popular indignation evoked by his act brought about the banishment of Gregory.

In the case of several countries, Gregory attempted to establish a claim of suzerainty on the part of the see of St. Peter, and to secure the recognition of its self-asserted rights of possession. On the ground of "immemorial usage," Corsica and Sardinia were assumed to belong to the Roman Church. Spain and Hungary were also claimed as her property, and an attempt was made to induce the king of Denmark to hold his realm as a fief from the pope. Philip I. of France, by his simony and the violence of his proceedings against the church, provoked a threat of summary measures; and excommunication, deposition and the interdict, appeared to be imminent in 1074. Gregory, however, refrained from translating his menaces into actions, although the attitude of the king showed no change, for he wished to avoid a dispersion of his strength in the conflict. The conflict was destined to break out in Germany. In England, again, William the Conqueror derived no less benefit from this state of affairs. He felt himself so safe that he interfered autocratically with the management of the church, forbade the bishops to visit Rome, filled bishoprics and abbies, and evinced little anxiety when the pope expropriated to him on the different principles which he entertained as to the relationship of church and state, or when he prohibited him from commerce or commanded him to acknowledge himself a vassal of the apostolic chair. Gregory had no power to compel the English king to an alteration in his ecclesiastical policy, so chose to ignore what he could not approve, and even considered it advisable to assure him of his particular affection.

Gregory, in fact, established relations—if no more—with every land in Christendom; though these relations did not invariably realize the ecclesiastico-political hopes connected with them. His correspondence extended to Poland, Russia and Bohemia. He wrote in friendly terms to the Saracen king of Mauretania in north Africa, and attempted, though without success, to bring the Armenians into closer contact with Rome. The East, especially, claimed his interest. The ecclesiastical rupture between the bishops of Rome and Byzantium was a severe blow to him, and he laboured hard to restore the former amicable relations. At that period it was impossible to suspect that the schism implied a definite separation, for prolonged schisms had existed in past centuries, but had always been surmounted in the end. Both sides, moreover, had an interest in repairing the breach between the churches. Thus, immediately on his accession to the pontificate, Gregory sought to come into touch with the emperor Michael VII. and succeeded. When the news of this triumph was Bishop Hone of Havelberg who was chosen for the archbishopric of Trier, and the political embarrassments of the case. By his own policy and ecclesiastical reform, Gregory did not stand alone, but on the contrary found powerful support. Since the middle of the 11th century the tendency—mainly represented by Cluny—towards a stricter morality and a more earnest attitude to life, especially on the part of the clergy, had converted the papacy; and, from Leo IX. onward, the popes had taken the lead in the movement. Even before his election, Gregory had gained the confidence of these circles, and, when he assumed the guidance of the church, they laboured for him with extreme devotion. From his letters we see how he fostered his connexion with them and stimulated their efforts. At the same time he showed the same advance of his reform, and the same desire to bring to the Pope an increase of wealth and revenues. Gregory was the cause of God and that to further it was to render service to God. By this means he created a personal party, unconditionally attached to himself, and he had his confidants in every country. In Italy Bishop Anselm of Lucca, to take an example, belonged to their number. Again, the duchess Beatrice of Tuscany and her daughter the Margravine Matilda, who put her great wealth at his disposal, were of inestimable service. The empress Agnes also adhered to his cause. In upper Italy the Patresiæ had worked for him in many ways, and all who stood for his objects stood for the pope. In Germany at the beginning of his reign the higher ranks of the clergy stood aloof from him and were confirmed in their attitude by some of his regulations. But Bishop Altmann of Passau, who has already been mentioned, and Archbishop Gebhard of Salzburg, were among his most zealous followers. That the convent of Hirsau in Swabia was held by Gregory was a fact of much significance, for its monks spread over the land as itinerant agitators and accomplished much for him in southern Germany. In England Archbishop Lanfranc of Canterbury probably stood closest to him, though he was not always ready to awake the consciousness that his cause was the cause of the Holy Land already floated before Gregory's vision, and his intention was to place himself at the head. But the hour for such a gigantic enterprise was not yet come, and the impending struggle with Henry IV. turned his energies into another channel.

It is impossible to lay down a definite law as to ecclesiastical policy and ecclesiastical reform, Gregory did not stand alone, but on the contrary found powerful support. Since the middle of the 11th century the tendency—mainly represented by Cluny—towards a stricter morality and a more earnest attitude to life, especially on the part of the clergy, had converted the papacy; and, from Leo IX. onward, the popes had taken the lead in the movement. Even before his election, Gregory had gained the confidence of these circles, and, when he assumed the guidance of the church, they laboured for him with extreme devotion. From his letters we see how he fostered his connexion with them and stimulated their efforts. At the same time he showed the same advance of his reform, and the same desire to bring to the Pope an increase of wealth and revenues. Gregory was the cause of God and that to further it was to render service to God. By this means he created a personal party, unconditionally attached to himself, and he had his confidants in every country. In Italy Bishop Anselm of Lucca, to take an example, belonged to their number. Again, the duchess Beatrice of Tuscany and her daughter the Margravine Matilda, who put her great wealth at his disposal, were of inestimable service. The empress Agnes also adhered to his cause. In upper Italy the Patresiæ had worked for him in many ways, and all who stood for his objects stood for the pope. In Germany at the beginning of his reign the higher ranks of the clergy stood aloof from him and were confirmed in their attitude by some of his regulations. But Bishop Altmann of Passau, who has already been mentioned, and Archbishop Gebhard of Salzburg, were among his most zealous followers. That the convent of Hirsau in Swabia was held by Gregory was a fact of much significance, for its monks spread over the land as itinerant agitators and accomplished much for him in southern Germany. In England Archbishop Lanfranc of Canterbury probably stood closest to him, though he was not always ready to awake the consciousness that his cause was the cause of the Holy Land already floated before Gregory's vision, and his intention was to place himself at the head. But the hour for such a gigantic enterprise was not yet come, and the impending struggle with Henry IV. turned his energies into another channel.

The whole life-work of Gregory VII. was based on his conviction that the church has been founded by God and entrusted with the task of embracing all mankind in a single society in which His will is the only law; that, in her capacity as a divine institution, she outtops all human structures; and that the pope, qua head of the church, is the vice-regent of God on earth, so that disobedience to him implies disobedience to God—or, in other words, a defection from Christianity. Elaborating an idea discoverable in St. Augustine, he looked on the worldly state—a purely human creation—as an unhallowed edifice whose character is sufficiently manifest from the fact that it abolishes the equality of man, and that it is built up by violence and injustice. He developed these views in a famous series of letters to Bishop Hermann of Metz. But it is clear from the outset that we are only dealing with reflections of strictly theoretical importance; for any attempt to interpret them in terms of action would have bound the church to annihilate not merely a single definite state, but all states. Thus Gregory, as a politician desirous of achieving some result, was driven in practice to adopt a different standpoint. He acknowledged the existence of the state as a dispensation of Providence, described the coexistence of church and state as a divine ordinance, and emphasized the necessity of union between the sacre-
of no discussion and which he had never doubted. Again, this very superiority of the church implied in his eyes a superiority of the papacy, and he did not shrink from drawing the extreme conclusions from these premises. In other words, he claimed the right of excommunicating and deposing incapable monarchs, and of confirming the choice of their successors. This habit of thought needs to be appreciated in order to understand his efforts to bring individual states into feudual subjection to the chair of St Peter. It was no mere question of formality, but the first step to the realization of his ideal theocracy comprising every single state.

Since this papal conception of the state involved the exclusion of independence and autonomy, the history of the relationship between church and state is the history of one continued struggle. The state was a dangerous and authoritarian institution of the Middle Ages, and Gregory was no more an exception to the rule than his immediate successors. The whole question of the investiture of the nobility and the laying-on of hands of the pope to temporal dignitaries was the source of much conflict, and Gregory III is one of the worst offenders.

In the Middle Ages, the right of the church to impose temporal jurisdiction in the lands under its spiritual jurisdiction was not questioned. The idea was that the church was invested with temporal power in order to enable it to support its spiritual authority. The church was to be the depository of the spiritual power of the king, and the king was to be the depository of the temporal power of the church. The investiture controversy was the result of the conflict between the temporal and the spiritual power of the church. The investiture controversy was a struggle for the control of the church by the emperor, and the church was determined to retain its temporal power.

In 1073 Gregory II attempted to resolve the controversy by means of a decree that the investiture of the archbishops and bishops was to be performed by the pope, and not by the emperor. This decree was pronounced invalid, and Gregory was excommunicated. The controversy continued for several years, and it was not until 1076 that the controversy was finally settled by the papal investment of the archbishops and bishops.

This settlement was not entirely satisfactory to the emperor, and he continued to resist the papal claims. In 1077 the emperor, Henry IV, excommunicated the pope, and the contest continued for several years. Finally, in 1080, the emperor was compelled to accept the papal authority, and the investiture controversy was at an end.

The investiture controversy was a struggle for the control of the church by the emperor, and the church was determined to retain its temporal power. The church had a right to impose temporal jurisdiction in the lands under its spiritual jurisdiction, and the investiture controversy was the result of the conflict between the temporal and the spiritual power of the church. The church was determined to retain its temporal power, and the emperor was determined to control it.

The controversy was finally settled by the papal investment of the archbishops and bishops, and the empire was compelled to accept the papal authority. The controversy was ended, but the struggle for the control of the church continued for many years. The church and the empire were engaged in a constant struggle for the control of the church, and the controversy was not resolved until the thirteenth century.
the politician, too rough in his methods, too exclusively the representative of the Roman see and its interests, he had gained more enemies than friends. He was of course a master of statecraft; for his attempts at political ends with consummate skill, causing them to masquerade as requirements of religion; but he forgot that incitement to civil war, the preaching of rebellion, and the release of subjects from their oaths, were methods which must infallibly lead to moral anarchy, and tend, with justice, to stifle the confidence once felt in him. The more he accustomed his contemporaries to the belief that every and any measure—so long as it opened up some prospect of success—was good in his sight, no matter how dangerous the fruits it might mature, the fainter grew the claim of the gift of prophecy. He was sufficiently developed to allow the vice-gerent of Christ to be heard instead of the hierarch in his official acts.

But to estimate the pontificate of Gregory by the disasters of its closing years would be to misconceive its significance for the history of the papacy entirely. On the contrary, his reign forms an important chapter in the history of the popedom as an institution; it contains the germs of far-reaching modifications of the church, and it gave new impulses to both theory and practice, the value of which may indeed be differently estimated, but of which the effects are indubitable. It was he who conceived and formulated the ideal of the papacy as a structure embracing all peoples and lands. He took the first step towards the codification of ecclesiastical law and the definite ratification of the claims of the apostolic chair as corner-stones in the church’s foundation. He educated the clergy and the lay world in obedience to Rome; and, finally, it was due to his efforts that the duty of the priest with regard to sexual abstinence was never afterwards a matter of doubt in the Catholic Christianity of the West.

On the 25th of May 1085 he died, unbroken by the misfortunes of his last years, and unshaken in his self-certainty. Dogitium justitium et dediti iniquitatem; propterea morior in exilio—are said to have been his last words. In 1584 Gregory XIII. received him into the Martyrologium Romanum; and in 1606 he was canonized by Paul V. The words dedicated to him in the Brevarium Romanum, for May 25, contain such an apothecosis of his pontificate that in the 18th and 19th centuries they were prohibited by the governments of several countries with Roman Catholic populations.

Bibliography.—A comprehensive survey of the sources and literature for the history of Gregory VII. is given by C. Mirtz, s.v. "Gregor VII." in Herzog-Hauck, Realencyclopadie, 3rd ed. vol. vii. pp. 96 sqq. The main source for the reign of Gregory consists of his letters and decrees, the greater part of which are collected in the Registrum (ed. P. Jaffé, Bibliotheca rerum Germanicarum, ii., Berlin, 1869) for which editing the notes and official acts are also reprinted by Jaffé under the title of Epistolae colleciae. The Dictata Papae—a list of twenty-seven short sentences on the rights of the pope,—which is given in the Registrum, is not the work of Gregory VII., but should probably be ascribed to Cardinal Deusdedit. Further: A. Potthast, Bibliotheca historia medii aevi, i. (2nd ed., Berlin, 1896), pp. 541 sqq., ii. 1357; P. Jaffé, Regesta pontificum (2nd ed., 1869), vol. ii. pp. 394-649, 477-513, tom. ii., pp. 25-364, 477-513. The most important of Gregory’s other official acts are reprinted by C. Mirtz, Quellen zur Geschichte des Papsttums (2nd ed., Tübingen, 1901), No. 183 sqq., pp. 100 sqq. The oldest life of Gregory is that by Pajol, reprinted by Paul Wattrich, Vita pontificum, i. 474-546. Among the historians the following are of especial importance: Berthold, Bernold, Lambert von Hersfeld, Bruno, Mariano Scutoris, Leo of Ostia, Peter of Marce, Giovanni Tommaso, Giovanni Trotula, Raimondi, Landulf of Milan, Donizo—their works being reprinted in the section "Scribares" in the Monumenta Germaniae historica, vols. vi., vii., viii., xii. The struggles which broke out under Gregory VII. and were partially continued in the subsequent decades gave rise to a pamphlet literature which is of extreme importance for their internal history. The extant materials vary greatly in extent, and display much diversity from the literary-historical point of view. Many of the works are reprinted in the Graecorum, Saristarum, et Latinarum scriptoribus conscriptis, tome i. (Hanover, 1801), tome ii. (1892), tome iii. (1897). In addition, two major investigations of the whole has received much benefit from the critical editions of the sources in the Monumenta Germaniae, so that the old literature is for the most part antiquated. This is true even of the great monograph on this pope—G. Baun, Pape Gregoire VII. (erst von C. W. Schaffhausen, 1859-1861), which must be used with extreme caution. The present state of criticism is represented by the following works: G. Meyer von Kronau, Johanniter der deutschen Reichen unter Heinrich IV. (Leipzig, 1889), tom. i. (Leipzig, 1890), ii. (1894), iii. (1900), iv. (1903); W. Martens, Gregor VII., sein Leben und Werken (2 vols., Leipzig, 1904); C. Mirtz, Die Publizistik im Zeitalter Gregors VII. (Leipzig, 1895); A. Hofer, Gregor VII. (2nd ed., Leipzig, 1894). The special literature on individual events during the Gregorian pontificate is so extensive that no list can be given here. On Gregory’s elevation to the chair, cf. C. Mirtz, Die Wahl Gregors VII. (Marburg, 1892). See also A. H. Mathew, D.D., Life and Times of Hildebrand, Pope Gregory VII. (1910). Gregory VIII. (Mauritius Burdinus), antipope from 1118 to 1121, was a native of southern France, who had crossed the Pyrenees while young and had later been made archbishop of Braga. Suspended by Paschal II. in 1114 on account of a dispute with the Spanish primates and papal legate, the archbishop of Toledo, he went to Rome and regained the favour to such an extent that he was appointed papal legate on very important legations. He opposed the extreme Hildebrandine position of his predecessor of Gelasius II. to concede the emperor’s claim to investiture, he was proclaimed pope at Rome by Henry V. on the 8th of March 1118. He was not universally recognized, however, and never fully enjoyed the papal office. He was excommunicated by Gelasius II. in April 1118, and by Calixtus II. at the synod of Reims (October 1119). He was driven from Rome by the latter in June 1121, and, having been surrendered by the citizens of Sutri, he was forced to accompany in ridiculous guise the triumphant procession of Calixtus through Rome. He was exiled to the abbey of La Celle near Blois.

The life of Gregory VIII. by Baluzius in Balzai missallanes, vol. i., ed. by J. D. Mansi (Lucca, 1876), is an excellent vindication of an antipope. The chief sources are in the Monumenta Germaniae historica, Scriptores, vols. 5 and 20, and in J. M. Watterich, Pontif. Romanum, vii. ed. 2. See C. Mirtz, Die Publizistik im Zeitalter Gregors VII. (Leipzig, 1894); J. Langen, Geschichte der römischen Kirche von Gregor VII. bis Innozenz III. (Bonn, 1893); Jaffé, Regesta pontif., Roman., 2nd ed. (1885-1888); K. von Hefele, Conciliorum et sanctorum actuum historia in the Middles Ages, vol. 4, trans. by Mrs. G. W. Hamilton (London, 1900-1902); P. B. Gams, Kirchengeschichte von Spanien, vol. 3 (Regensburg, 1876).

Gregory VIII. (Alberto de Mora), pope from the 21st of October to the 17th of December 1187, a native of Benevento and Fraeモンstratensian monk, successively abbot of St Martin at Laon, cardinal-donex of San’ Adriano al foro, cardinal-priest of San Lorenzo in Lucina, and chancellor of the Roman Church, was elected to succeed Urban III. Of amiable disposition, he hastened to make peace with Henry VI. and promised not to oppose the latter’s claim to Sicily. He addressed general letters both to the bishops, reminding them of their duties to the Roman Church, especially of their required visits ad limina, and to the whole Christian people, urging a new crusade to recover Jerusalem. He died at Pisa while engaged in making peace between the Pisans and Genoese in order to secure the help of both cities in the crusade. His successor was Clement III.

Gregory IX. (Ugolino Conti de Segni), pope from the 19th of March 1227, to the 22nd of August 1241, was a nobleman of Anagni and probably a nephew of Innocent III. He studied
At Paris and Bologna, and, having been successively archpriest of St Peter’s, papal chaplain, cardinal-deacon of Sant’ Eustachio, cardinal-bishop of Ostia, the first protector of the Franciscan order, and papal legate in Germany under Innocent III., and Honorius III., he succeeded the latter in the papacy. He had long been on friendly terms with the emperor Frederick II., but now excommunicated him (29th of September 1232) to company with his enemies, the Latins, and to undertake the crusade. When Frederick finally set out the following June without making submission to the pope, Gregory raised an insurrection against him in Germany, and forced him in 1230 to beg for absolution. The Romans, however, soon began a very bitter war against the temporal power and exiled the pope (1st of June 1231). Hardly had this contest been brought to an end favourable to the papacy (May 1235) when Gregory came into fresh conflict with Frederick II. He again excommunicated the emperor and released his subjects from their allegiance (24th of March 1230). Frederick, on his side, invaded the Papal States and prevented the assembling of a general council convoked for Easter 1241. The work of Gregory, however, was by no means limited to his relations with emperor and Romans. He systematized the Inquisition and entrusted it to the Dominicans; his rules against heretics remained in force until the time of Sixtus V. He supported Henry III. against the English barons, and protested against the Pragmatic Sanction of Louis IX. of France. He sent monks to Constantinople to negotiate with the Greeks for church union. He concluded a defensive alliance with the kings of England, France, Aragon and Sicily, when he died at Arezzo on the 13th of July 1241. He was a nobleman, fond of peace and actuated by the consciousness of a great mission. He has been honoured as a saint by the inhabitants of Arezzo and Piacenza. His successor in the papacy was Innocent V.

Gregory XI. (Pierre Roger de Beaufort), pope from the 30th of December 1270 to the 27th of March 1278, born in Limousin in 1330, created cardinal-deacon of Sta Maria Nuova by his uncle, Clement VI., was the successor of Urban V. His efforts to establish peace between France and England and to aid the Eastern Christians against the Turks were fruitless, but he succeeded in the Visconti to make further encroachments on the States of the Church. He introduced many reforms in the various monastic orders and took vigorous measures against the heresies of the time. His energy was stimulated by the stirring words of Catherine of Siena, to whom in particular the transference of the papal see back to Italy (17th of January 1377) was almost entirely due. Whilst at Rome he issued several bulls to the archbishop of Canterbury, the king of England, and the university of Oxford, commanding an investigation of Wycliffe’s doctrines. Gregory was meditating over sending Vianno from Avignon to the Chinese, but the authors of the edicts of the Council of Lyons of 27th November 1274 had already seized Avignon in 1267, and now they were to have a pope for whom the treatise of 1274 had been written. They had a man of learning and full of zeal for the church, but irresolute and guilty of nepotism. The great schism, which was to endure fifty years, broke out soon after the election of his successor, Urban VI.

Gregory XII. (Angelo Coriari), or Correr, pope from the 30th of November 1406, to the 4th of July 1415, was born of a noble family at Venice about 1326. Successively bishop of Castello, Latin patriarch of Constantinople, cardinal-priest of San Marco, and papal secretary, he was elected to succeed Innocent VII., after an interregnum of twenty-four days, under the express condition that, should the antipope Benedict XIII. at Avignon renounce all claim to the papacy, he also would renounce his, so that the long schism might be terminated. As pope, he concluded a treaty with his rival at Marseilles, by which a general council was to be held at Savona in September, 1408, but King Ladislaus of Naples, who opposed the plan from policy, seized Rome and brought the negotiations to nought. Gregory had promised not to create any more cardinals, and when he did so, in 1408, his former cardinals deserted him and, together with the Avignon cardinals, convoked the council of all imperial rights in the States of the Church. The most celebrated among the many reform decrees issued by Gregory was the constitution determining for the first time the form of concilium at papal elections, which in large measure has remained ever since the law of the church. Gregory was on his way to Rome to crown Rudolph and send him out on a great crusade. He died at Marseilles on the 11th of July 1417.
Pisa, which, despite its irregularity, proclaimed in June 1409 the deposition of both popes and the election of Alexander V. Gregory, still supported by Naples, Hungary, Bavaria, and by Rupert, king of the Romans, found protection with Ladislaus, and in a synod at Cividale del Friuli banned Benedict and Alexander as schismatical, perjured and scandalmongers. His deposition being succeeded to the claims of Alexander in 1410, concluded a treaty with Ladislaus, by which Gregory was banished from Naples on the 31st of October 1411. The pope then took refuge with Carlo Malatesta, lord of Rimini, through whom he presented his resignation to the council of Constance on the 4th of July 1415. A weak and easily-influenced old man, his resignation was the noblest act of his pontificate. The rest of his life was spent in peaceful obscurity as cardinal-bishop of Porto and legate of the mark of Ancona. He died at Recanati on the 18th of October 1417. Several writers reckon Alexander V. and John XXIII. as popes rather than antipopes, and accordingly count Gregory's pontificate from 1406 to 1409. Roman Catholic authorities, however, incline to the other reckoning.

Gregory XIII. (Ugo Buoncompagno), pope from 1572 to 1585, was born on the 7th of January 1502, in Bologna, where he received his education, and subsequently taught, until called to Rome (1539) by Paul III., who employed him in various offices. He bore a prominent part in the council of Trent, 1563-1565. In 1564 he was made cardinal by Pius IV., and, in the following year, sent to Spain as legate. On the 13th of May 1572 he was chosen pope to succeed Pius V. His previous life had been rather worldly, and not wholly free from spot; but as pope he gave no occasion of offence. He submitted to the influence of the rigourists, and carried forward the war upon heresy, though not with the savage vehemence of his predecessor. However, he received the news of the massacre of St Bartholomew (23rd of August 1572) with joy, and publicly celebrated the event, having been led to believe, according to his apologists, that France had been miraculously delivered, and that the Huguenots had suffered justly as traitors. Having failed to rouse Spain and Venice against the Turks, Gregory attempted to form a general coalition against the Protestants. He subsidized Philip II. in his wars in the Netherlands; aided the Catholic League in France; incited attacks upon Elizabeth by way of Ireland. With the aid of the Jesuits, whose privileges he multiplied, he conducted a vigorous propaganda. He established or endowed above a score of colleges, among them the Collegium Romanum (founded by Ignatius Loyola in 1550), and the Collegium Germanicum, in Rome. Among his noteworthy achievements are the reform of the calendar on the 24th of February 1582 (see Calendar); the improved edition of the Corpus juris canonici, 1582; the splendid Gregorian Chapel in St Peter's; the fountains of the Piazza Navona; the Quirinal Palace; and many other public works. To meet the expenses entailed by his liberality and extravagance, Gregory resorted to confiscation, on the pretext of defective titles or long-standing arrears. The result was disastrous to the public peace: nobles armed in their defence; old feuds revived; the country became infected with bandits; not even in Rome could order be maintained. Amid these disturbances Gregory died, on the 10th of April 1585, leaving to his successor, Sixtus V., the task of pacifying the state.

See the contemporary lives by Cicarella, continuator of Platina, De vitis pontif. Rom.; Cicconius, Vita et res gestae summorum pontificum Gregoriii XIII.; comp. Campiello, Compendio de vita et santa v Vita di Gregory XIII. (Rome, 1591). See also Bompiano, \( \text{Histoire pontificats } \)Gregorii XIII. (Rome, 1655) Ranke, \( \text{Popes (Eng. trans., Austin), i. 428 seq. v. Reumont, Gesch. der Stadt Rom, iii. 687 seq. v. Reumont, Gesch. der Stadt Rom, i. 638 seq. v. Reumont, Gesch. der Stadt Rom, ii. 612 seq. v. Reumont, Gesch. der Stadt Rom, iii. 660 seq.)}

Gregory XIV. (Niccolò Sfondrato), pope 1590-1591, was born in Cremona, on the 11th of February 1535, studied in Perugia, and Padua, became bishop of his native place in 1560, and took part in the council of Trent, 1562-1563. Gregory XIII. made him a cardinal, 1583, but ill-health forbade his active participation. His death occurred the day before his papal coronation. He succeeded Urban VII. on the 5th of December 1590, was due to Spanish influence. Gregory was upright and devout, but utterly ignorant of politics. During his short pontificate the States of the Church suffered dire calamities, famine, epidemic and a fresh outbreak of brigandage. Gregory was completely subservient to Philip II.; he aided the league, excommunicated Henry of Navarre, and threatened his adherents with the ban; but the effect of his intervention was only to rally the moderate Catholics to the support of Henry, and to hasten his conversion. Gregory died on the 15th of October 1591, and was succeeded by Innocent X.

See Cicconius, \( \text{Vita et res gestae summorum pontif. Rom. (Rome, 1601-1602); Cicarella, continuator of Platina, De vitis pontif. Rom. (both contemporary); Brosch, Gesch. des Kirchenstaates (1880), i. 300; Ranke, Popes (Eng. trans., Austin), ii. 228 seq.)}

Gregory XV. (Alessandro Ludovisi) was born on the 9th of January 1554, in Bologna, where he also studied and taught. He was made a cardinal of his native city by Julius III., and Pius IV., and afterwards by Paul V., whom he succeeded as pope on the 9th of February 1621. Despite his age and feebleness, Gregory displayed remarkable energy. He aided the emperor in the Thirty Years' War, and the king of Poland against the Turks. He endorsed the claims of Maximilian of Bavaria to the electoral dignity, and was rewarded with the gift of the Heidelberg library, which was carried off to Rome. Gregory followed the Congregation of the Propaganda, encouraged missions, fixed the order to be observed in conclaves, and canonized Ignatius Loyola, Francis Xavier, Philip Neri and Teresa of Jesus. He died on the 8th of July 1623, and was succeeded by Urban VIII.

See the contemporary life by Vitorelli, continuator of Cicconius, \( \text{Vita et res gestae summorum pontif. Rom.; Ranke's excellent account, Popes (Eng. trans., Austin), ii. 468 seq. v. Reumont, Gesch. des Kirchenstaats (1880), iii. 370 seq.; and the extended bibliography in Herzog-Hauck, Realencyclopdie, s.v. "Gregor XV."}

Gregory XVI. (Bartolomeo Alberico Cappellari), pope from 1831 to 1846, was born at Belluno on the 8th of September 1765, and at an early age entered the order of the Camaldoli, among whom he rapidly gained distinction for his theological and linguistic acquisitions. His first appearance before a wider public was in 1799, when he published against the Italian Jansenists a controversial work entitled Ii Trieno della Santa Sedc del Papa. Besides writing through several editions in Italy, has been translated into several European languages. In 1800 he became a member of the Academy of the Catholic Religion, founded by Pius VII., to which he contributed a number of memoirs on theological and philosophical questions and in 1805 was made abbot of San Gregorio on the Caelian Hill. When Pius VII. was carried off from Rome in 1809, Cappellari withdrew to Murano, near Venice, and in 1814, with some other members of his order, he removed to Padua; but soon after the restoration of the pope he was recalled to Rome, where he received successive appointments as vicar general of the Camaldoli, councillor of the Inquisition, prefect of the Propaganda, and examiner of bishops. In March 1825 he was created cardinal by Leo XII., and shortly afterwards was entrusted with an important mission to adjust a concordat regarding the interests of the Catholics of Belgium and the Protestants of Holland. On the 2nd of February 1831 he was, after sixty-four days' convale, unexpectedly chosen to succeed Pius VIII. in the papal chair. The revolution of 1830 had just inflicted a severe blow on the ecclesiastical party in France, and almost the first act of the new pontiff was to seize Ancona, thus restoring all Italy, and particularly the Papal States, into an excited condition which seemed to demand strongly repressive measures. In the course of the struggle which ensued it was more than once necessary to call in the Austrian bayonets. The reactionaries in power put off their promised reforms so persistently as to anger even
Metterich; nor did the replacement of Bernetti by Lamburschini in 1836 mend matters; for the new cardinal secretary of state objected even to railways and illuminating gas, and was liberal chiefly in his employment of spies and of prisons. The embarras- ed financial condition in which Gregory left the States of the Church makes it doubtful how far his lavish expenditure in architectural and engineering works, and his magnificent patronage of learning in the schools of Mai, Mezzofanti, Gaetano, Monroni and others, were for the real benefit of his subjects. The years of his pontificate were marked by the steady development and diffusion of those ultramontane ideas which were ultimately formulated, under the presidency of his successor Pius IX, by the council of the Vatican. He died on the 1st of June 1846.

(W. W. R.*)

GREGORY, the name of a Scottish family, many members of which attained high eminence in various departments of science, fourteen having held professorships in mathematics or medicine. Of these most distinguished of their number a notice is given below.

I. GREGORY (1652-1720), eldest son of the Rev. John Gregory of Drumoak, Aberdeenshire, who married Janet Anderson in 1621. He was for some time connected with a mercantile house in Holland, but on succeeding to the family estate of Kinardie returned to Scotland, and occupied most of his time in scientific pursuits, freely giving his poorer neighbours the benefit of his medical skill. He is said to have been the first possessor of a barometer in the north of Scotland; and on account of his success by means of it in predicting changes in the weather, he was accused of witchcraft before the presbytery of Aberdeen, but he succeeded in convincing that body of his innocence.

II. GREGORY (1638-1675), Scottish mathematician, younger brother of the preceding, was educated at the grammar school of Aberdeen and at Marischal College of that city. At an early period he manifested a strong inclination and capacity for mathematics and kindred sciences; and in 1663 he published his famous treatise Optica promota, in which he made known his great invention, the Gregorian reflecting telescope. About 1665 he went to the university of Padua, where he studied for some years, and in 1667 published Vera circuli et hyperbolae quadra- tura, in which he discussed infinite convergent series for the areas of the circle and hyperbola. In the following year he published also at Padua Geometriae pars universalis, in which he gave a series of rules for the rectification of curves and the mensuration of their solids of revolution. On his return to England in this year he was elected a fellow of the Royal Society; in 1669 he became professor of mathematics in the university of St Andrews; and in 1674 he was transferred to the chair of mathematics in Edinburgh. In October 1675, while showing the satellites of the planet Jupiter to some of his students through one of his telescopes, he was suddenly struck with blindness, and he died a few days afterwards.

He was also the author of Exercitaciones geometricae (1668), and it is alleged, of a satirical tract entitled The Great and No. II., an illustration and a defence. A Treatise on Practical Geometry,

which he left in manuscript was translated from the Latin and published in 1745. He was succeeded in the chair of mathematics in Edinburgh by his brother James; another brother, Charles, was in 1707 appointed professor of mathematics in the university of St Andrews; and his eldest son, David (1666-1767), became professor of modern history at Oxford, and canon and subsequently dean of Christ Church.

IV. GREGORY (1724-1773), Scottish physician, grandson of James Gregory (1638-1675) and youngest son of Dr James Gregory (d. 1731), professor of medicine in King's College, Aberdeen, was born at Aberdeen on the 3rd of June 1724. He received his early education at a grammar school in Aberdeen and at King's College in that city, and in 1741 he attended the medical classes at Edinburgh university. In 1745 he went to Leiden to complete his medical studies, and during his stay there he received without solicitation the degree of doctor of medicine from King's College, Aberdeen. On his return from Holland he was elected professor of philosophy at King's College, but in 1749 he resigned his professorship on account of its duties interfering too much with his private practice. In 1754 he proceeded to London, where he made the acquaintance of many prominent physicians and was appointed to the same post in the college of physicians that had been held by his father.

On the death in November 1753 of his brother Dr James Gregory, who had succeeded his father as professor of medicine in King's College, Aberdeen, he was appointed to that office. In 1764 he removed to Edinburgh in the hope of obtaining a more extended field of practice as a physician, and in 1766 he was appointed professor of the practice of medicine in the university of Edinburgh, to whose eminence as a medical school he largely contributed. He died of gout on the 10th of February 1773.

He is the author of A Comparative View of the State and Faculties of Man with those of the Animal World (1765); Observations on the Duties, Offices and Qualifications of a Physician (1772); Elements of the Science of Life (1778); and A Father's Precept (1774). His Whole Works, with a life by Mr Tytler (afterwards Lord Woodhouselee), were published at Edinburgh in 1788.

V. GREGORY (1753-1821), Scottish physician, eldest son of the preceding, was born at Aberdeen in January 1753. He accompanied his father to Edinburgh in 1764, and after going through the usual course of literary studies at that university, he was for a short time a student at Christchurch, Oxford. It was there probably that he acquired that taste for classical learning which afterwards distinguished him. He studied medicine at Edinburgh, and, after graduating doctor of medicine in 1774, spent the greater part of the next two years in Holland, France and Italy. Shortly after his return to Scotland he was appointed in 1776 to the chair his father had formerly held, and in the following year he also entered on the duties of teacher of clinical medicine in the Royal Infirmary. On the illness of Dr William Cullen in 1790 he was appointed joint-professor of the practice of medicine, and he became the head of the Edinburgh Medical School on the death of Dr Cullen in the same year. He died on the 2d of April 1821. As a medical practitioner Gregory was for the last ten years of his life at the head of the profession in Scotland. He was at one time president of the Edinburgh College of Physicians, but his indiscretion in publishing certain private proceedings of the college led to his suspension on the 13th of May 1809 from all rights and privileges which pertained to the fellowship.

Besides his Conspectus medicinae theoreticae, published in 1788 as a text-book for his lectures on the institutes, Dr Gregory was the author of "A Theory of the Moods of Verbs," published in the Edinburgh Trans. (1757), and of Literary and Philosophical Essays, published in two volumes in 1792.

VI. WILLIAM GREGORY (1803-1858), son of James Gregory (1753-1821), was born on the 25th of December 1803. In 1837 he became professor of chemistry at the Andersonian Institution, Glasgow, in 1839 at King's College, Aberdeen, and in 1844 at Edinburgh University. He died on the 24th of April 1858. Gregory was one of the first in England to advocate the theories of Liebig, who had adopted several of his works. He is also the author of Outlines of Chemistry (1845), and an Elementary Treatise on Chemistry (1853).
VII. DUNCAN EARPQUASON GREGORY (1813-1844), brother of the preceding, was born on the 13th of April 1813. After studying at the university of Edinburgh he in 1833 entered Trinity College, Cambridge, where he was for a time assistant professor of chemistry, but he devoted his attention chiefly to mathematics. He died on the 23rd of February 1844.

The Cambridge Mathematical Journal was originated, and for some time edited, by him; and he also published A Collection of Examples of Processes in the Differential and Integral Calculus (1841). A Treatise on the Application of Analysis to Solid Geometry, which he left unfinished, was completed by W. Walton, and published posthumously in 1846. His Mathematical Works were published with a biographical memoir by Robert Leslie Ellis, appeared in 1865.

GREGORY, EDWARD JOHN (1850-1900), British painter, born at Southampton, began work at the age of fifteen in the engineer's drawing office of the Peninsular and Oriental Company. Afterwards he studied at South Kensington, and about 1871 entered on a successful career as an illustrator and as an admirable painter in oil and water colour. He was elected associate of the Royal Academy in 1883, academican in 1888, and president of the Royal Institute of Painters in Water Colours in 1898. His work is distinguished by remarkable technical qualities, by exceptional firmness and decision of draughtsmanship and by unusual certainty of handling. His “Marooned,” a water colour, is in the National Gallery of British Art. Many of his pictures were shown at Burlington House at the winter exhibition of 1909-1910 after his death in June 1909.

GREGORY, OLINTHUS GILBERT (1774-1841), English mathematician, was born on the 29th of January 1774 at Yaxley in Huntingdonshire. Having been educated by Richard Weston, a Leicester botanist, he published in 1793 a treatise, Lessons Astronomical and Philosophical. Having settled at Cambridge in 1796, Gregory first acted as sub-editor on the Cambridge Intelligencer, and then opened a bookseller's shop. In 1802 he obtained an appointment as mathematical master at Woolwich through the influence of Charles Hutton, to whose notice he had been brought by a manuscript on the “Use of the Sliding Rule”; and when Hutton resigned in 1807 Gregory succeeded him in the professorship. Failing health obliged him to retire in 1838, and he died at Woolwich on the 2nd of February 1841.

Gregory wrote Hints for the Use of Teachers of Elementary Mathematics (1830, new edition 1853), and Mathematics for Practical Men (1825), which was revised and enlarged by Henry Law in 1848, and again by J. R. Young in 1862. His Letters on the Evidences of Christianity (1811), which was several times reprinted, and an address to the nation was published by the Religious Tract Society in 1833. He will probably be long remembered for his Biography of Robert Hall, which first appeared in the collected edition of Hall's works, was published separately in 1833, and has since passed through several editions. The minor importance of his Memoir of John Mason Good (1828) is due to the narrower fame of the subject. Gregory was one of the founders of the Astronomical Society. In 1802 he was appointed editor of the Gentleman's Magazine and in 1818 editor of the Ladies' Diary and superintendent of the almanacs of the Stationers' Company.

GREFENBEN, a town of Germany, in the Prussian province of Pomerania, on the Rega, 43 m. N.E. of Stettin on the railway to Kolberg. Pop. (1905) 7208. It has two Evangelical churches (among them that of St Mary, dating from the 13th century), several ancient gateways, a powder tower and a gymnasia. The manufacture of machines, stoves and bricks is the principal industries. Greifenberg possessed municipal rights as early as 1262, and in the 14th and 15th centuries had a considerable trade in broken brick and stone, which it lost much of its prosperity during the Thirty Years' War.

See Riemann, Geschichte der Stadt Greifenberg (1862).

GREFENHAGEN, a town of Germany, in the Prussian province of Pomerania, on the Reglitz, 12 m. S.S. of Stettin by rail. Pop. (1905) 6473. Its prosperity depends chiefly on agriculture and it has a considerable trade in cattle. There are also coal and iron industries. Greifenhagen was built in 1230, and was raised to the rank of a town and fortified about 1250. In the Thirty Years' War it was taken both by the imperialists and the Swedes, and in 1675 it was captured by the Brandenburgers, into whose possession it came finally in 1679.

GREFISWALD, a town of Germany, in the Prussian province of Pomerania, on the navigable Ryk, 3 m. from its mouth on the Baltic at the little port of Wyk, and 20 m. S.E. from Stralsund by rail. Pop. (1875) 18,022, (1905) 23,750. It has wide and regular streets, flanked by numerous gabled houses, and is surrounded by pleasant promenades on the site of its old ramparts. The three Gothic Protestant churches, the Marienkirche, the Nikolaikirche and the Jakobskirche, and the town-hall (Rathaus) are the principal edifices, and these with their lofty spires are very picturesque. There is a statue of the emperor Frederick III. and a memorial in the town. The industries mainly consist in shipbuilding, fish-curing, and the manufacture of machinery (particularly for agriculture), and the commerce in the export of corn, wood and fish. There is a theatre, an orphanage and a municipal library. Greifswald is, however, best known to fame by reason of its university. This, founded in 1456, is well endowed and is largely frequented by students of medicine. Connected with it are a library of 150,000 volumes and 800 MSS., a chemical laboratory, a zoological museum, a nautical institute, an ophthalmological school, a botanical garden and an orphanage at Eldena (a seaside resort on the Baltic) an agricultural school. In front of the university, which had 775 students and about 100 teachers in 1904, stands a monument commemorating its four hundredth anniversary.

Greifswald was founded about 1240 by traders from the Netherlands. In 1250 it received a town constitution and Lübeck rights from Duke Wartislaw of Pomerania. In 1270 it joined the Hanse towns, Stralsund, Rostock, Wismar and Lübeck, and took part in the wars which they carried on against the kings of Denmark and Norway. During the Thirty Years' War it was formed into a fortress by the imperialists, but they vacated it in 1631 to the Swedes, in whose possession it remained after the peace of Westphalia. In 1678 it was captured by the elector of Brandenburg, but was restored to the Swedes in the following year; in 1713 it was desolated by the Russians; in 1715 it came into the possession of Denmark; and in 1721 it was again restored to Sweden, under whose protection it remained till 1815, when, along with the whole of Swedish Pomerania, it came into the possession of Prussia.

See J. G. L. Kosegarten, Geschichte der Universität Greifswald (1850); C. Gestrind, Beitrag zur Geschichte der Stadt Greifswald (3 vols., 1827-1829); and I. Ziegler, Geschichte der Stadt Greifswald (Greifswald, 1897).

GRIESEN (in French, hyalomictite), a modification of granite, consisting essentially of quartz and white mica, and distinguished from granite by the absence of felspar and biotite. In the hand specimen the rock has a silvery glittering appearance from the ashes of mica, but in thin sections, under the microscope, it have much of the appearance of granite, except that they are paler in colour. The commonest accessory minerals are tourmaline, topaz, apatite, fluor spar and iron oxides; a little felspar more or less altered may also be present and a brown mica which is biotite or lithionite. The tourmaline in section is brown, green, blue or colourless, and often the same crystal shows many different tints. The white mica forms mostly large plates with imperfect crystalline outlines. The quartz is rich in fluid enclosures. Apatite and topaz are both colourless and of irregular form. Felspar if present may be orthoclase or oligoclase.

Greisen occurs typically in belts or veins intersecting granite. At the centre of each vein there is usually a fissure which may be open or filled with quartz. The greisen bands are from 1 in. up to 2 ft. or more in thickness. At their outer edges they pass gradually into the granite, for they contain felspar crystals more or less completely altered into aggregates of white mica and quartz. The transition between the two rocks is perfectly gradual, a fact which shows that the greisen has been produced by alteration of the granite. Vapours or fluids rising through the fissure have been the agents which effect the transformation. They must have contained fluorine, boron and probably also lithium, for topaz, mica and tourmaline, the new minerals of the granite, contain these elements. The change is a post-volcanic
or pneumatolytic one induced by the vapours set free by the granite magma when it cools. Probably the rock was at a relatively high temperature at the time. A similar type of alteration, the development of white mica, quartz and tourmaline, is found sometimes in sedimentary rocks around granite masses. Greisen is closely connected with schorl both in its mineralogical composition and in its mode of origin. The latter is a pneumatolytic product consisting of quartz and tourmaline; it often contains white mica and thus passes by all stages into greisen. Both of these rocks carry frequently small percentages of tin oxide (cassiterite) and may be worked as ores of tin. They are common in Cornwall, Saxony, Tasmania and other districts which are centres of tin-mining. Many other greisens occur in which no tin is found. The analyses show the composition of

of Cornish granite and greisen. They make it clear that there has been an introduction of fluorine and boron and a diminution in the alkalies during the transformation of the granite rock into the greisen.

(G. S. F.)

GREIZ, a Crown of Germany, capital of the province of Reuss-Greiz (Reuss the Elder), in a pleasant valley on the right bank of the White Elster, near the borders of Saxony, and 66 m. by rail S. from Leipzig. Pop. (1895) 12,657; (1905) 23,114. It consists of two parts, the old town on the right bank and the new town on the left bank of the river; it is rapidly growing and is regularly laid out. The principal buildings are the palace of the prince of Reuss-Greiz, surrounded by a fine park, the old château on a rocky hill overlooking the town, the summer palace with a fine garden, the old town church dating from 1225 and possessing a beautiful tower, the town hall, the governmental buildings and statues of the emperor William I. and of Bismarck.

There are classical and modern schools and a school of textile industry. The industries are considerable, and include dyeing, tanning and the manufacture of woolen, cotton, shawls, coverlets and paper. Greiz (formerly Grezow) is apparently a town of Slav origin. From the 12th century it was governed by advocati (Vogt), but in 1236 it came into the possession of Gera, and in 1550 of the younger line of the house of Plessen. It was wholly destroyed by fire in 1494, and almost totally in 1802.

See Wilhe, Greiz und seine Umgebung (1873), and Jahresbericht des Vereins für Greizer Geschichte (1894, seq.).

GRENADE, the southernmost of the Windward Islands, British West Indies. It lies between 11° 58' and 12° 15' N. and between 61° 35' and 61° 50' W., being 140 m. S.W. of Barbados and 85 m. N. by W. of Trinidad. In shape oval, it is 21 m. long, 12 m. broad at its maximum and has an area of 133 sq. m. It owes much of its beauty to a well-wooded range of mountains traversing the island from N. to S. and throw off from the centre spurs which form picturesque and fertile valleys. These mountains attain their highest elevation in Mount Catherine (2750 ft.). In the S.E. and N.W. there are stretches of low or undulating ground, devoted to fruit growing and cattle raising. The island is of volcanic origin; the only signs of upheaval are raised limestone beaches in the extreme N. Red and grey sandstones, hornblende and argillaceous schist are found in the mountains, porphyry and basaltic rocks also occur; sulphur and fuller's earth are worked.

In the centre, at the height of 1740 ft. above the sea, is the chief natural curiosity of Grenada, the Grand Etang, a circular lake, 13 acres in extent, occupying the site of an ancient crater. Near it is a large sanatorium, much frequented as a health resort. In the north-east is a larger lake, Lake Antoine, also occupying a crater, but it lies almost at the sea level. The island is watered by several short rivers, mainly on the east and south; there are numerous fresh water springs, as well as hot chalybeate and sulphurous springs. The southeastern coast is much indented with bays. The climate is good, the temperature equable and epidemic diseases are rare. In the low country the average yearly temperature is 82° F., but it is cooler in the heights. The rainfall is very heavy, amounting in some parts to as much as 200 in., a year. The rainy season lasts from May to December, and small falls are common all year round. The average annual rainfall at St Georges is 79-07 in., and at Grand Etang 164 in. The excellent climate and good sea-bathing have made Grenada the health resort of the neighbouring islands, especially of Trinidad. Good roads and byeways intersect it in every direction. The soil is extraordinarily fertile, the chief products being cocoa and spices, especially nutmegs. The exports, sent chiefly to Great Britain, are cocos, spices, wool, cotton, coffee, live stock, hides, turtles, turtle shell, kola nuts, vanilla and timber. Barbados is dependent on Grenada for the majority of its foodstuffs. Sugar is still grown, and rum and molasses are made, but the consumption of these is confined to the island.

Elementary education is chiefly in the hands of the various denominations, whose schools are assisted by government grants-in-aid. There are, however, a few secular schools conducted by the government, and government-aided secondary schools for girls and a grammar school for boys. The schools are controlled by a Board of Education, the members of which are nominated by the government; but the Board is in reality independent. The governor of the Windward Islands resides in Grenada and is administrator of it. The Legislative Council consists of 14 members; 7 including the governor are ex-officio members and the rest are nominated by the Crown. English is universally spoken, but the negroes use a French patois, which, however, is gradually dying out. Only 2% of the inhabitants are white, the rest being negroes and mulattoes with a few East Indians.

The capital, St George, in the south-west, is built upon a lava peninsula jutting into the sea and forming one side of its landlocked harbour. It is surrounded by an amphitheatre of hills, the tips of which project into the sea, and form the headland, or point, of the island, the town being built on the lower slopes of the peninsula. The Fish market is on the sea front. The streets are narrow, and the houses in general are of modern construction.

History.—Grenada was discovered in 1498 by Columbus, who named it Conception. Neither the Spanish nor the British, to whom it was granted in 1627, settled on the island. The governor of Martinique, du Parquet, purchased it in 1650, and the French were well received by the Caribs, whom they afterwards extirpated with the greatest cruelty. In 1665 Grenada passed into the hands of the French West India Company, and was administered by it until its dissolution in 1764, when the island passed to the French Crown.

Cocos, coffee and cotton were introduced in 1744. During the wars between Great Britain and France, Grenada capitulated to the British forces in 1762, and was formally ceded next year by the Treaty of Paris. The French, under Count d'Estaing, recaptured the island in 1779, but it was restored to Great Britain by the Treaty of Versailles in 1783. A rebellion against the British rule, instigated and assisted by the French, occurred in 1795, but was quelled by Sir Ralph Abercromby in the following year. The emancipation of the slaves took place in 1837, and in 1877 it was found necessary to introduce East Indian labour. Grenada, with cocoa as its staple, has not experienced similar depression to that which overtook the sugar-growing islands of the West Indies.

GRENADE (from the French word for a pomegranate, from a resemblance in shape to that fruit), a small spherical explosive vessel thrown by hand. Hand-grenades were used in war in the 16th century, but the word "grenade" was also from the
GRENADIER—GRENOBLE

GRENADINES, a chain of islets in the Windward Islands, West Indies. They stretch for 60 m. between St Vincent and Grenada, following a N.E. to S.W. direction, and consist of some 200 islets and rocks. Some are a few square miles in extent; others are merely rocky cones projecting from the deep. For purposes of administration they are divided between St Vincent and Grenada. Bequia, the chief island in the St Vincent group, is long and narrow, with an area 6 sq. m. Owing to a lack of water it is only slightly cultivated, but game is plentiful. Admiralty Bay, on the W. side, is a safe and commodious harbour. Carriacou, belonging to Grenada, is the largest of the group, being 7 m. long, 2 m. wide and 13 sq. m. in extent. A ridge of hills, rising to an altitude of 700 ft., traverses the centre from E. to W.; here are found two good harbours. There are two good harbours on the west coast, Hillsborough Bay on which stands Hillsborough, the chief town, and Tyrell Bay, farther south. The island is thickly populated, the negro peasantry occupying small lots and working on the metayer system. Excellent oysters are found along the coast, and cotton and cattle are the chief exports. Pop. of the group, mostly on Carriacou (1901) 6407.

GRENOBLE, the ancient capital of the Dauphiné in S.E. France, and now the chief town of the Isère department, 75 m. by rail from Lyons, 68 m. from Grenoble, and 85½ m. from Gap. Pop. (1906), town, 58,641; commune, 102,722. It is one of the most beautifully situated, and also one of the most strongly fortified, cities in Europe. Built at a height of 702 ft. on both banks of the river Isère just above its junction with the Drac, the town occupies a considerable plain at the south-western end of the fertile Grésivaudan valley. To the north rise the mountains of the Grande Chartreuse, to the east the range of Belle-donne, and to the south those of Taillefer and the Moucherotte, the higher summits of these ranges being partly covered with snow. From the Jardin de Ville and the quays of the banks of the Isère the summit of Mont Blanc itself is visible. The upper part of the town rises on the left bank of the Isère, which is bordered by broad quays. The older part has the tortuous and narrow streets usual in towns that have been confined within fortifications, but in modern times these hindrances have been demolished. The newer part of the town has wide thoroughfares and buildings of the modern French type, solid but not picturesque. The original town (of but small extent) was built on the right bank of the Isère at the southern foot of the Mont Rachais, now covered by a succession of fortresses that rise more or less detached from the banks of the river to a very considerable height ($85$ ft. above the town).

Grenoble is the seat of a bishopric which was founded in the 4th century, and now comprises the department of the Isère—formerly a suffragan of Vienne It now forms part of the ecclesiastical province of Lyons. The most remarkable building in the town is the Palais de Justice, erected (late 13th century to 16th century) on the site of the old palace of the Parlement of the Dauphiné. Opposite is the most noteworthy church of the city, that of St André (13th century), formerly the chapel of the dauphins of the Viennons; in it is the 17th century monument of Bayard (1476–1524), the chevalier sans peur et sans reproche, which was removed thither in 1822; but it is uncertain whose bones are therein. The cathedral church of Notre Dame is a heavy building, dating in part from the 11th century. The church of St Laurent, on the right bank of the Isère, is the oldest in the city (11th century) and has a remarkable crypt, dating from Merovingian times. The town hall is a mainly modern building, constructed on the site of the palace of the dauphins, while the prefecture is entirely modern. The town library contains a considerable collection of paintings, mainly of the modern French school, but is more remarkable for its very rich collection of MSS. (7000) and printed books (750,000 vols.) which in great part belonged till 1703 to the monastery of the Grande Chartreuse. The natural history museum houses rich collections of various kinds, which contain (inter alia) numerous geological specimens from the neighbouring districts of the Dauphiné and Savoy. The university, revived in modern times

first used to imply an explosive shell fired from a gun; this survives to the present day in the German Granate. These weapons were employed after about 1660, by special troops called “grenadiers” (q.v.), and in the wars of the 17th and 18th centuries they are continually met with. They became obsolete in the 19th century, but were given a new lease of life in the 20th, owing to their employment in the siege of Port Arthur in 1904, where hand-grenades of a modern type, and containing powerful modern explosives, proved very effective (see AMMUNITION, Shell). Hand-grenades filled with chemicals and made of glass are used as a method of fire-extinction, and similar vessels containing a liquid with a very strong smell are used to discover defects in a drain or sewer.

In the 17th century, a GRENADIER, originally a soldier whose special duty it was to throw hand-grenades. The latter were in use for a considerable time before any special organization was given to the troops who were to use them. In 1667 four men per company in the French Régiment du Roi were trained with grenades (siege of Lille), and in 1668-1670 grenadier companies were formed in this regiment and in about thirty others of the French line. Evelyn, in his Diary, tells us that on the 29th of June 1678 he saw at Hounslow a “a new sort of soldiers called grenadiers, who were dexterous in flinging hand-grenades.” As in the case of the musketeers, the French practice was copied quickly by the English. Eventually each English battalion had a grenadier company (see for illustrations Archaeological Journal, xxiii. 223, and xlvii. 321-324). Besides their grenades and the firelock, grenadiers carried axes which, with the grenades, were employed in the assault of fortresses, as we are told in the celebrated song, “The British Grenadiers.”

The grenadier companies were formed always of the most powerful men in the regiment and, when the grenade ceased to be used, they maintained their existence as the crack companies of their battalions, taking the right of the line on parade and wearing the distinctive grenadier headdress. This system was almost universal, and the typical infantry regiment of the 18th and early 19th century had a grenadier and a light company besides its “line” companies. In the British and other armies these élite companies were frequently taken from their regiments and combined in grenadier and light infantry battalions for special service, and Napoleon carried this practice still further in the French army by organizing brigades and divisions of grenadiers (and correspondingly of voltigeurs). Indeed the companies thus detached from the line practically never returned to it, being employed almost continually in war. Those who with serious evil, for the loss of his left arm at the outbreak of war lost perhaps a quarter of its best men, the average men only remaining with the line. This special organization of grenadiers and light companies lasted in the British army until about 1858. In the Prussian service the grenadiers became permanent and independent battalions about 1790, and the gradual adoption of the four-company battalion by Prussia and other nations tended still further to place the grenadiers by themselves and apart from the line. Thus at the present day in Germany, Russia and other countries, the title of “grenadiers” is borne by line regiments, indistinguishable, except for details of uniform and often the esprit de corps inherited from the old élite companies, from the rest. In the British service the only grenadiers remaining are the Grenadier Guards, originally the 1st regiment of Foot Guards, which was formed in 1660 on the nucleus of a regiment of English royalists which followed the fortunes of Charles II. in exile. In Russia a whole army corps (headquarters Moscow), inclusive of its artillery units, bears the title.

The special headdress of the grenadier was a pointed cap, with peak and flaps, of embroidered cloth, or a loose fur cap of similar shape; both these were light field service caps. The fur cap has in the course of time developed into the tall “bearskin” worn by British guards and various corps of other armies; the embroidered field cap survives, transformed, however, into a heavy brass headdread, in the uniform of the 1st Prussian Foot Guards, the 1st Prussian Guard Grenadiers and the Russian Paul (Pavlovsky) Grenadier Guards.
after a long abeyance, occupies a modern building, as does also the hospital, though founded as far back as the 15th century. There are numerous societies in the town, including the Académie Delphinaie (founded in 1772), and many charitable institutions. The staple industry of Grenoble is the manufacture of kid gloves, most of the so-called gants Jouvins being made here—they are named after the reviver of the art, X. Jouvin (1800-1844). There are about 80 glove factories, which employ 18,000 persons (of whom 15,000 are women), the annual output being about 800,000 dozen pairs of gloves. Among other articles produced at Grenoble are artificial cements, liqueurs, straw hats and carved furniture.

Grenoble occupies the site of Cularo, a village of the Allobroges, which only became of importance when fortified by Dioecletian and Maximian at the end of the 3rd century. Its present name is a corruption of Gratianopolis, a title assumed probably in honour of Gratian (4th century), who raised it to the rank of a civitas. After passing under the power of the Burgundians (c. 440) and the Franks (512) it became part of the kingdom of Provence (899-1032). On the break-up of that kingdom a long struggle for supremacy ensued between the bishops of the city and the counts of Albun, the latter finally winning the day in the 11th century, and taking the title of Dauphins of the Viennois in the 13th century. In 1349 Grenoble was ceded with the rest of the Dauphiné to France, but retained various municipal privileges which had been granted by the dauphins to the town, originally by a charter of 1242. In 1592 it was sacked by the Protéstant under the baron des Adrets, but in 1597 the firmness of its governor, Bertrand de Gordes, saved it from a repetition of the Massacre of St Bartholomew. In 1590 Lesdiguières (1543-1626) took the town in the name of Henry IV., still a Protestant, and during his long governorship which lasted to his death did much for it by the construction of fortifications, quays, &c. In 1788 the attempt of the king to weaken the power of the parlement of Grenoble (which, though strictly a judicial authority, had preserved traditions of independence, since the suspension of the states-general of the Dauphiné in 1678) roused the people to arms, and the "day of the tiles" (7th of June 1788) is memorable for the defeat of the royal forces. In 1790, on the formation of the department of the Jâvre, Grenoble became its capital. Grenoble was the first important town to open its gates to Napoleon on his return from Elba (27th of March 1815), but a few months later (July) it was obliged to surrender to the Austrian army. Owing to its situation Grenoble was formerly much subject to floods, particularly in the case of the wild Drac. One of the worst took place in 1219, while that of 1778 was known as the déluge de la Saint Crispin. Among the celebrities who have been born at Grenoble are Vaucanson (1709-1782), Mably (1700-1785), Condillac (1715-1780), Beyle, best known as Stendhal, his nom de guerre (1783-1842), Barnave (1761-1793) and Casimir Perier (1777-1832).

See A. Prudhomme, Histoire de Grenoble (1888); X. Roux, La Corporation des gantiers de Grenoble (1887); H. Duhamel, Grenoble considéré comme centre d'excursions (1902); J. Marcon, Cartulaires de l'Église caholicoïdale de Grenoble (Paris, 1890). (W. A. B. C.)

GRENVILLE, SIR BEVIL (1596-1643), Royalist soldier in the English Civil War (see GREAT REBELLION), was educated at Exeter College, Oxford. As member of Parliament for Cornwall, then for Launceston, Grenville supported Sir John Eliot and the opposition, and his intimacy with Eliot was lifelong. In 1639, however, he appears as a royalist going to the Scottish War in the train of Charles I. The reasons of this change of front are unknown, but Grenville's honour was above suspicion, and he must have entirely convinced himself that he was doing right. At any rate he was a very valuable recruit to the royalist cause, being "the most generally loved man in Cornwall." At the outbreak of the Civil War he and others of the gentry not only proclaimed the king's Commission of Array at Launceston as seconded, but also persuaded the grand jury of the county to declare their opponents guilty of riot and unlawful assembly, whereupon the Posse comitatus was called out to expel them. Under the command of Sir Ralph Hopton, Sir Bevil took a distinguished part in the action of Bradock Down, and at Stratton (16 May 1643), where the parliamentary earl of Stamford was completely routed by the Cornishmen, led one of the storming parties which captured Chudleigh's lines (Clarendon, vii. 80). A month later, the endeavours of Hopton to unite with Maurice and Hertford from Oxford brought on the battle of Lansdown, near Bath. Here Grenville was killed at the head of the Cornish infantry as it reached the top of the hill. His death was a blow from which the king's cause in the West never recovered, for he alone knew how to handle the Cornishmen. Hopton they revered and respected, but Grenville they loved as peculiarly their own commander, and after his death there is little more heard of the reckless valour which had won Stratton and Lansdown. Grenville is the type of all that was best in English royalism. He was neither rapacious, drunken nor dissolute, but his loyalty was unselfish, his life pure and his skill no less than his bravery unquestionable. A monument to him has been erected on the field of Lansdown.

See Lloyd, Memoirs of Excellent Personages (1668); S. R. Gardiner, History of the English Civil War (vol. i. passim).

GRENVILLE, GEORGE (1712-1770), English statesman, second son of Richard Grenville and Hester Temple, afterwards Countess Temple, was born on the 14th of October 1712. He was educated at Eton and at Christ Church, Oxford, and was called to the bar in 1735. He entered parliament in 1741 as member for Buckingham, and continued to represent that borough till his death. In parliament he was a member of the "Boy Patriot" party which opposed Sir Robert Walpole. In December 1744 he became a lord of the admiralty in the Pelham administration. He allied himself with his brother Richard and with William Pitt in forcing their feeble chief to give them promotion by rebelling against his authority and obstructing business. In June 1747 he became a lord of the treasury, and in 1754 treasurer of the navy and privy councilor. As treasurer of the navy in 1758 he introduced and carried a bill which established a less unfair system of paying the wages of the seamen than had existed before. He remained in office in 1761, when his brother Lord Temple and his brother-in-law Pitt resigned upon the question of the war with Spain, and in the administration of Lord Bute he was entrusted with the leadership of the House of Commons. In May 1762 he was appointed secretary of state, and in October first lord of the admiralty; and in April 1763 he became first lord of the treasury and chancellor of the exchequer. The most prominent measures of his administration were the prosecution of Wilkes and the passing of the American Stamp Act, which led to the first symptoms of alienation between America and the mother country. During the latter period of his term of office he was on a very unsatisfactory footing with the young king George III., who gradually came to feel a kind of horror of the interminable persistency of his conversation, and whom he endeavoured to make use of as the mere puppet of the ministry. The king made various attempts to induce Pitt to come to his rescue by forming a ministry, but without success, and at last had recourse to the marquis of Rockingham, on whose agreeing to accept office Grenville was dismissed July 1765. He never again held office, and died on the 13th of November 1770.

The nickname of "gentle shepherd" was given him because he bore the House by asking over and over again, during the debate on the Cider Bill of 1753, that somebody should tell him "where" to lay the new tax if it was not to be put on cider. Pitt whistled the air of the popular tune "Gentle Shepherd, tell me where," and the House laughed. Though few excelled him in a knowledge of the forms of the House or in mastery of administrative details, his tact in dealing with men and with affairs was so defective that there is perhaps no one who has been at the head of an English administration to whom a lower place can be assigned as a statesman.

In 1747 he married Elizabeth, daughter of Sir William Wyndham, by whom he had a large family. His son, the second Earl Temple, was created marquess, and his grandson Duke, of Buckingham. Another son was William, afterwards Lord
GRENVILLE, Another, Thomas Grenville (1755-1846), who was, with one interval, a member of parliament from 1780 to 1812, and for a few months during 1806 and 1807 president of the board of control and first lord of the admiralty, is perhaps more famous as a book-collector than as a statesman; he bequeathed his large and valuable library to the British Museum.

The Grenville Papers, being the Correspondence of Richard Grenville, Earl Temple, K.G., and Sir Henry Wotton, K.G., Contemporaries, were published at London in 1852, and afford the chief authority for his life. But see also H. Walpole's Memoirs of the Reign of George II. (London, 1845); Lord Stanhope's History of Lord Grenville (London, 1858); Lord Grenville's History of England (1858); and E. D. Adams, The Influence of Grenville on Pitt's Foreign Policy (Washington, 1904).

GRENVILLE (or GRENVILLE), SIR RICHARD (c. 1541-1591), British naval commander, was born of an old Cornish family about 1541. His grandfather, Sir Richard, had been marshal of Calais in the time of Henry VIII., and his father commanded and was lost in the "Mary Rose" in 1543. At an early age Grenville is supposed to have served in Hungary under the emperor Maximilian against the Turks. In the years 1571 and 1584 he sat in parliament for Cornwall, and in 1583 and 1584 he was commissioner for the works at Dover harbour. He appears to have been a man of much pride and ambition. Of his bravery there can be no doubt. In 1585 he commanded the fleet of seven vessels by which the colonists sent out by his cousin, Sir Walter Raleigh, were carried to Roanoke Island in the present North Carolina. Grenville himself soon returned with the fleet to England, capturing a Spanish vessel but losing the carrying vessels. After some time at home, or perhaps in the Spanish main, he was in 1590 attached to the fleet which was despatched against Cadiz, and finding the colony deserted, left a few men to maintain possession. He then held an important post in charge of the defences of the western counties of England. When a squadron was despatched in 1591, under Lord Thomas Howard, to intercept the homeward-bound treasure-fleet of Spain, Grenville was appointed as second in command on board the "Revenge," a ship of 500 tons which had been commanded by Drake against the Armada in 1588. At the end of August Howard with 16 ships lay at anchor to the north of Flores in the Azores. On the last day of the month he received news from a pinnace, sent by the earl of Cumberland, who was then off the Portuguese coast, that a Spanish fleet of 53 vessels was then bearing up to the Azores to meet the treasure-ships. Not being in a position to fight a fleet more than three times the size of his own, Howard gave orders to weigh anchor and stand out to sea. But, either from some misunderstanding of the order, or from some idea of Grenville's that the Spanish vessels rapidly approaching were the ships for which they had been waiting, the "Revenge" was delayed and cut off from her consorts by the Spaniards. Grenville resolved to try to break through the middle of the Spanish line of battle. He steered a course, made under a very heavy fire of a huge galleon, and after a hand-to-hand fight lasting through fifteen hours against fifteen Spanish ships and a force of five thousand men, the "Revenge" with her hundred and fifty men was captured. Grenville himself was carried on board the Spanish flag-ship "San Pablo," and died a few days later. The incident is commemorated in Tennyson's ballad of "The Revenge."

The spelling of Sir Richard's name has led to much controversy. Four different families, each of which claim to be descended from him, spell it Grenville, Grenville, Grenfell and Greenfield. The spelling usually accepted is Grenville, but his own signature in a bold clear handwriting, among the Tanner MSS. in the Bodleian library at Oxford, is Greynville.

GRENVILLE (or GRANE), SIR RICHARD (1600-1668), English royalist, was the third son of Sir Bernard Grenville (1559-1636), and a grandson of the famous seaman, Sir Richard Grenville. Having served in France, Germany and the Netherlands, Grenville gained the favour of the duke of Buckingham, took part in the expeditions to Cadiz, to the island of Rhé and to La Rochelle, was knighted, and in 1628 was chosen member of parliament for Fowey. Having married Mary, daughter of Sir Charles Howard (1612) and a lady of fortune, Grenville was made a baronet in 1630; his violent temper, however, made the marriage an unhappy one, and he was ruined and imprisoned as the result of two lawsuits, one with his wife, and the other with her kinsman, the earl of Suffolk. In 1643 he escaped from prison and went to Germany, returning to England six years later to join the army which Charles I. was collecting to march against the Scots. Early in 1644, just after the outbreak of the Irish rebellion, Sir Richard led some troops to Ireland, where he won some fame and became governor of Trim; then, returning to England in 1643 he was arrested at Liverpool by an officer of the parliament, but was soon released and allowed to join the parliamentary army. Having, however, secured men and money, he hurried to Charles I. at Oxford and was despatched to take part in the siege of Plymouth, quickly becoming the leader of the forces engaged in this enterprise. Compelled to raise the siege he retired into Cornwall, where he helped to resist the advancing Parliamentarians; but he quickly showed signs of insubordination, and, whilst sharing in the siege of Taunton, he was wounded and obliged to resign his command. About this time loud complaints were brought against Grenville. He had bribed Sir T. Gascoigne, said, in a letter (1659), to the king's council to favour the privateers. He also rumoured that he had hanged some men and imprisoned others; he had extorted money and had used the contributions towards the cost of the war for his own ends. Many of these charges were undoubtedly true, but upon his recovery the councillors of the prince of Wales gave him a position under Lord Goring, whom, however, he refused to obey. Equally recalcitrant was his attitude towards Goring's successor, Sir Ralph Hopton, and in January 1646 he was arrested. But he was soon released; he went to France and Italy, and, after visiting England in disguise passed some time in Holland. While he was excepted by parliament from participation in 1648, and after the king's execution he was banished to Holland. In 1712, he was impeached by the Home Board and condemned to death for his services to the parlements of France and elsewhere until some unfounded accusation which he brought against Edward Hyde, afterwards earl of Clarendon, led to his removal from court. He died in 1658, and was buried at Ghent. In 1644, when Grenville deserted the parliamentary party, a proclamation was put out against him; in this there were attached to his name several offensive epithets, among them being skellum, a word probably derived from the German Schelm, a scoundrel. Hence he is often called skellum Grenville."

Grenville wrote an account of affairs in the west of England, which had been in his possession, in a letter (1659), to the king's council to favour the privateers. He also rumoured that he had hanged some men and imprisoned others; he had extorted money and had used the contributions towards the cost of the war for his own ends. Many of these charges were undoubtedly true, but upon his recovery the councillors of the prince of Wales gave him a position under Lord Goring, whom, however, he refused to obey. Equally recalcitrant was his attitude towards Goring's successor, Sir Ralph Hopton, and in January 1646 he was arrested. But he was soon released; he went to France and Italy, and, after visiting England in disguise passed some time in Holland. While he was excepted by parliament from participation in 1648, and after the king's execution he was banished to Holland. In 1712, he was impeached by the Home Board and condemned to death for his services to the parlements of France and elsewhere until some unfounded accusation which he brought against Edward Hyde, afterwards earl of Clarendon, led to his removal from court. He died in 1658, and was buried at Ghent. In 1644, when Grenville deserted the parliamentary party, a proclamation was put out against him; in this there were attached to his name several offensive epithets, among them being skellum, a word probably derived from the German Schelm, a scoundrel. Hence he is often called skellum Grenville."

GRESHAM, SIR T.

questions of foreign policy. In spite of his multifarious duties at the foreign office Grenville continued to take a lively interest in domestic matters, which he showed by introducing various bills into the House of Lords. In February 1801 he resigned office with Pitt because George III. would not consent to the introduction of any measure of Roman Catholic relief, and in opposition he gradually separated himself from his former leader. When Pitt returned to power in 1804 Grenville refused to join the ministry unless his political ally, Fox, was also admitted; this was impossible and he remained out of office until February 1806, when just after Pitt's death he became the nominal head of a coalition government. This ministry was very unfortunate in its conduct of foreign affairs, but it deserves to be remembered with honour on account of the act passed in 1807 for the abolition of the slave trade. Its influence, however, was weakened by the death of Fox, and in consequence of a minute drawn up by Grenville and some of his colleagues the king demanded from his ministers an assurance that in future they would not urge upon him any measures for the relief of Roman Catholics. They refused to give this assurance and in March 1807 they resigned. Grenville's attitude in this matter was somewhat aggressive; his colleagues were not unanimous in supporting him, and Sheridan, one of them, said "he had known many men knock their heads against a wall, but he had never before heard of any man who collected the bricks and built the very wall with an intention to knock out his own brains against it."

Lord Grenville never held office again, although he was requested to do so on several occasions. He continued, however, to take part in public life, being one of the chief supporters of Roman Catholic emancipation, and during the remaining years of his active political career, which ended in 1823, he generally voted with the Whigs, although in 1815 he separated himself from his colleague, Charles Grey, and supported the warlike policy of Lord Liverpool. In 1819, when the marquess of Lansdowne brought forward his motion for an inquiry into the causes of the distress and discontent in the manufacturing districts, Grenville delivered an alarmist speech advocating repressive measures. His concluding years were spent at Dropmore, Buckinghamshire, where he died on the 12th of January 1834. His wife, whom he married in 1792, was Anne (1772-1864), daughter of Thomas Pitt, 1st Baron Camelford, but he had no issue and his title became extinct. In 1809 he was elected chancellor of Oxford university.

Though Grenville's talents were not of the highest order his straightforwardness and industry, together with his knowledge of politics and the moderation of his opinions, secured for him considerable political influence. He may be enrolled among the band of English statesmen who have distinguished themselves in literature. He edited Lord Chatham's letters to his nephew, Thomas Pitt, afterwards Lord Camelford (London, 1804, and other editions); he wrote a small volume, Nugae Mericae (1824), being translations into Latin from English, Greek and Italian, and an Essay on the Supposed Advantages of a sinking Fund (1828).

The Dropmore MSS. contain much of Grenville's correspondence, and on this the Historical Manuscripts Commission has published a report.

GRESHAM, SIR THOMAS (1519-1579), London merchant, the founder of the Royal Exchange and of Gresham College, London, was descended from an old Norfolk family; he was the only son of Sir Richard Gresham, a leading London merchant, who for some time held the office of lord mayor, and for his services as agent of Henry VIII. in negotiating loans with foreign merchants received the honour of knighthood. Though his father intended him to follow his own profession, he nevertheless sent him for some time to Calais College, Cambridge, but there is no information as to the duration of his residence. It is uncertain also whether it was before or after this that he was apprenticed to his uncle Sir John Gresham, who was also a merchant, but we have his own testimony that he served an apprenticeship of eight years. In 1543, at the age of twenty-four, he was admitted a member of the Mercers' Company, and in the same year he went to the Low Countries, where, either on his own account or on that of his father or uncle, he both carried on business as a merchant and acted in various matters as an agent for Henry VIII. In 1544 he married the widow of William Read, a London merchant, but he still continued to reside principally in the Low Countries, having his headquarters at Antwerp. When in 1551 the mismanagement of Sir William Dassell, "king's merchant" in the Low Countries, had brought the English government into great financial embarrassment, Gresham was called in to give his advice, and chosen to carry out his own proposals. Their leading feature was the adoption of various methods—slighty ingenious, but quite arbitrary and unfair—for raising the value of the pound sterling on the "bourse" of Antwerp, and it was so successful that in a few years nearly all King Edward's debts were discharged. The advice of Gresham was likewise sought by the government in all their money difficulties, and he was also frequently employed in various diplomatic missions. He had no stated salary, but in reward of his services received from Edward various grants of lands, the annual value of which at that time was ultimately about £400 a year. On the accession of Mary he was for a short time in disfavour, and was displaced in his post by Alderman William Dauntsey. But Dauntsey's financial operations were not very successful and Gresham was soon reinstated; and as he professed his zealous desire to serve the queen, and manifested great adroitness both in negotiating loans and in smuggling money, arms and foreign goods, not only were his services retained throughout her reign, but besides his salary of twenty shillings per diem he received grants of church lands to the yearly value of £500. Under Queen Elizabeth, besides continuing in his post as financial agent of the crown, he acted temporarily as ambassador at the court of the duchess of Parma, being knighted in 1559 previous to his departure. By the outbreak of the war in the Low Countries he was compelled to leave Antwerp on the 19th of March 1567; but, though he spent the remainder of his life in London, he continued his business as merchant and financial agent of the government in much the same way as formerly. Elizabeth also found him useful in a great variety of other ways, among which was that of acting as jailer, to Lady Mary Grey, who, as a punishment for marrying Thomas Keys the sergeant porter, remained a prisoner in his house from June 1566 to the end of 1572. In 1565 Gresham made a proposal to the court of aldermen of London to build at his own expense a bourse or exchange, on condition that they purchased for this purpose a piece of suitable ground. In this proposal he seems to have had an eye to his own interest as well as to the general good of the merchants, for by a yearly rental of £700 obtained for the shops in the upper part of the building he received a sufficient return for his trouble and expense. Gresham died suddenly, apparently of apoplexy, on the 21st of November 1579. His only son predeceased him, and his widow, also a niece and daughter of Thomas Gresham, married the 2nd Lord Bacon, brother of the great Lord Bacon. With the exception of a number of small sums bequeathed to the support of various charities, the bulk of his property, consisting of estates in various parts of England of the annual value of more than £2500, was bequeathed to his widow and her heirs with the stipulation that after her decease his residence in Bishopsgate Street, as well as the rents arising from the Royal Exchange, should be vested in the hands of the corporation of London and the Mercers' Company, for the purpose of instituting a college in which seven professors should read lectures—one each day of the week—on astronomy, geometry, physick, law, divinity, rhetoric and music. The lectures were begun in 1597, and were delivered in the original building until 1768, when, on the ground that the trustees were losers by the gift, it was made over to the crown for a yearly rent of £500, and converted into an excise office. From that time a room in the Royal Exchange was used for the lectures until 1843; the present building was erected at a cost of £7000.

Sir Thomas Gresham has been called "the first of the Gresham professors, the founder of the Gresham professors, but the fullest account of him, as well as of the history of the Exchange and Gresham College is that by J. M. Burgon in his Life and Times of Sir Thomas Gresham (2 vols., 1880). See also a Brief Memoir of Sir Thomas Gresham (1835); and the Life of Sir Thomas Gresham, Founder of the Royal Exchange (1845).
GRESHAM, W. O.—GRÉTRY

GRESHAM, WALTER QUINTON (1832-1895), American statesman and jurist, was born near Lanesville, Harrison county, Indiana, on the 17th of March 1832. He spent two years in an academy at Corydon, Indiana, and one year at the Indiana State University at Bloomington, then studied law, and in 1854 was admitted to the bar. He was active as a campaign speaker for the Republican ticket in 1856, and in 1860 was elected to the State legislature. Replied to him, a strong Democratic district. In the House he was chairman of the committee on military affairs, he did much to prepare the Indiana troops for service in the Federal army; in 1861 he became colonel of the 53rd Indiana Volunteer Infantry, and subsequently took part in Grant's Tennessee campaign of 1862, and in the operations against Corinth and Vicksburg, where he commanded a brigade. In August 1863 he was appointed brigadier-general of volunteers, and was placed in command of the Federal forces at Natchez. In 1864 he commanded a division of the 17th Army Corps in Sherman's Atlanta campaign, and before Atlanta, on the 20th of July, he received a wound which forced him to retire from active service, and left him lame for life. In 1865 he was brevetted major-general of volunteers. After the war he practiced law at New Albany, Indiana, and in 1869 was appointed by President Grant United States District Judge for Indiana. In April 1873 he succeeded Timothy O. Howe (1816-1883) as postmaster-general in President Arthur's cabinet, taking an active part in the suppression of the Louisiana Lottery, and in September 1875 succeeded Charles J. Felger as secretary of the treasury. He was appointed by President Cleveland as United States Judge for the Seventh Judicial Circuit. Gresham was a candidate for the Republican presidential nomination in 1884 and 1888, in the latter year leading for some time in the balloting. Gradually, however, he grew out of sympathy with the Republican leaders and policy, and in 1892 advocated the election of the Democratic candidate, Grover Cleveland, for the presidency. From the 7th of March 1893 until his death at Washington on the 28th of May 1895, he was secretary of state in President Cleveland's cabinet.

GRÉTRY'S LAW, in economics, the name suggested in 1857 by H. D. Macleod for the principle of currency which may be briefly summarized—"bad money drives out good." Macleod gave it this name, which has been universally adopted, under the impression that the principle was first explained by Sir Thomas Gresham in 1558. In reality it had been well set forth by earlier economic writers, notably Oresme and Copernicus. Macleod states the law in these terms: the worst form of currency in circulation regulates the value of the whole currency and drives all other forms of currency out of circulation. Gresham's law applies where there is under-weight or debased currency in circulation with full-weight coin of the same metal; where there are two metals in circulation, and one is undervalued as compared with the other, and where inconvertible paper money is put into circulation side by side with a metallic currency. See further Bimetallism; Money.

GRÉRET, JEAN BAPTISTE LOUIS (1709-1777), French poet and dramatist, was born at Amiens on the 20th of August 1709. His poem Vert Vert is his main title to fame. He spent, however, the last twenty-five years of his life in regretting the failure of his verses, which were to become the mainstay of future French poetry. He was brought up by the Jesuits of Amiens. He was accepted as a novice at the age of sixteen, and sent to pursue his studies at the Collège Louis le Grand in Paris. After completing his course he was appointed, being then under twenty years of age, to a post as assistant master in a college at Rouen. He published Vert Vert at Rouen in 1734. It is a story, in itself exceedingly humorous, showing how a parrot, the delight of a convent, whose talk was all of prayers and pious ejaculations, was conveyed to another convent as a visitor to please the nuns. On the way he falls among bad companions, forgets his convent language, and shocks the sisters on arrival by profane swearing. He is sent back in disgrace, punished by solitude and plain bread, presently repents, reforms and is killed by kindness. The story, however, is nothing. The treatment of the subject, the atmosphere which surrounds it, the delicacy in which the little prattling ways of the nuns, their jealousies, their tiny trifles, are presented, takes the reader entirely by surprise. The poem stands absolutely unrivalled, even among French contes en vers.

Gresset found himself famous. He left Rouen, went up to Paris, where he found refuge in the same garret which had sheltered him when a boy at the Collège Louis le Grand, and there wrote his second poem, La Charivari. It was followed by the Carême improvisé, the L'Avare vivant and Les Ombres.

Then trouble came upon him; complaints were made to the fathers of the alleged licentiousness of his verses, the real cause of complaint being the ridicule which Vert Vert seemed to throw upon the whole race of nuns and the anti-clerical tendency of the other poems. An example, it was urged, must be made; Gresset was expelled the order. Men of robust mind would have been glad to get rid of such a yoke. Gresset, who had never been taught to stand alone, went forth weeping. He went to Paris in 1740 and there produced Édouard III, a tragedy (1749) and Sidonie (1745), a comedy. These were followed by Le Méchant which still keeps the stage, and is qualified by Brunettière as the best verse comedy of the French 18th century theatre, not excepting even the Mêtronomie of Alexis Piron. Gresset was admitted to the Academy in 1748. And then, still young, he retired to Amiens, where his relapse from the discipline of the church became the subject of the deepest remorse. He died at Amiens on the 16th of June 1777.

The best edition of his poems is A. A. Rédournard's (1811). See Juies-Wors (1925) by L. Gresset.
GREUZE, J. B.

applause. It is said that the study of the score of one of Monsigny’s operas, lent to him by a secretary of the French embassy in Rome, decided Grétry to devote himself to French comic opera. On New Year’s day 1767 he accordingly left Rome, and after a short stay at Geneva (where he made the acquaintance of Voltaire, and produced another operetta) went to Paris. There for two years he had to contend with the difficulties incident to his position, and the insecurity of his situation. He was hurried in and out of the city, and his house was continually visited by friends, and by the intercession of Count Creutz, the Swedish ambassador, Grétry obtained a libretto from Marmontel, which he set to music in less than six weeks, and which, on its performance in August 1768, met with unparalleled success. The name of the opera was Le Huron. Two others, Lucile and Le Tableau parlant, soon followed, and thenceforth Grétry’s position as the leading composer of comic opera was safely established. Altogether he composed some fifty operas. His masterpieces are Zémire et Azor and Richard Cœur de Lion—the first produced in 1771, the second in 1784. The latter in an indirect way became connected with a great historic event. In it occurs the celebrated romance, O Richard, ô mon roi, Vainqueur abandoned, which was sung at the banquet—“fatal as that of Thyestes,” remarks Carlyle—given by the bodyguard to the officers of the Versailles garrison on October 3, 1789. The Marseillaise not long afterwards became the reply of the people to the expression of loyalty borrowed from Grétry’s opera. The composer himself was not uninfluenced by the great events he witnessed, and the titles of some of his operas, such as La Rosière républicaine and La Fête de la ration, sufficiently indicate what political beliefs he held, but they are mere pièces de circonstance, and the republican enthusiasm displayed is not genuine. Little more successful was Grétry in his dealings with classical subjects. His genuine power lay in the delineation of character and in the expression of tender and typically French sentiment. The structure of his concerted pieces on the other hand is frequently flimsy, and his instrumentation so feeble that the orchestral parts of some of his works had to be rewritten by other composers, in order to make them acceptable to modern audiences. During the revolution Grétry lost much of his property, but the successive governments of France vied in favouring the composer, regardless of political differences. From the old court he received distinctions and rewards of all kinds; the republic made him an inspector of the conservatoire; Napoleon granted him the cross of the legion of honour and a pension. Grétry died on the 24th of September 1813, at the Hermitage in Montmorency, formerly the house of Rousseau. Fifteen years after his death Grétry’s heart was transferred to his birthplace, permission having been obtained after a tedious lawsuit. In 1842 a colossal bronze statue of the composer was set up at Liège.

See Michael Brenet, Vie de Grétry (Paris, 1883); Joseph de Binon, Notice historique sur la vie et les ouvrages de Grétry (Paris, 1814); A. Grétry (his nephew), Grétry en famille (Paris, 1814); Felix van Hulst, Grétry (Liège, 1842); L. D. S. Notice biographique sur Grétry (Bruxelles, 1869).

GREUZE, JEAN BAPTISTE (1725-1805), French painter, was born at Tournus, in Burgundy, on the 21st of August 1725, and is generally said to have formed his own talent; this is, however, true only in the most limited sense, for at an early age his inclinations, though thwarted by his father, were encouraged by a Lyon merchant named Grand, or Grangaud, during his lifetime considerable reputation as a portrait-painter. Grandon not only persuaded the father of Greuze to give way to his son’s wishes, and permit the lad to accompany him as his pupil to Lyons, but, when at a later date he himself left Lyons for Paris—where his son-in-law Grétry the celebrated composer enjoyed the height of favour—Grandon carried young Greuze with him. Settled in Paris, Greuze worked from the living model in the school of the Royal Academy, but did not attract the attention of his teachers; and when he produced his first picture, ‘Le Père de famille explicant la BIBLE aux enfants,’ which they bought with all the zeal of which they were capable, they little suspected what his future was to be. By other and more remarkable works of the same class Greuze soon established his claims beyond contest, and won for himself the notice and support of the well-known connoisseur La Live de Julluy, the brother-in-law of Madame d’Épinay. In 1755 Greuze exhibited his “Aveugle trompé,” upon which, presented by Pigalle the sculptor, he was immediately agréé by the Academy. Towards the close of the same year he left France for Italy, in company with the Abbé Louis Gougenot, who had deserted from the magistrature—although he had obtained the post of “conseiller au Châtelet”—in order to take up the petit collet. Gougenot had some acquaintance with the arts, and was highly valued by the Academicians, who, during his journey with Greuze, elected him an honorary member of their body on account of his studies in mythology and allegory; his acquirements in these respects are said to have been largely utilized by them, but to Greuze they were of doubtful advantage, and he lost rather than gained by this visit to Italy in Gougenot’s company. He had undertaken it probably in order to silence those who taxed him with ignorance of “great models of style,” but the Italian subjects which formed the entirety of his contributions to the Salon of 1757 showed that he had been put on a false track, and he speedily returned to the source of his first inspiration. In 1759, 1761 (“L’Accordée de village”—Louvre), and 1763 Greuze exhibited with ever-increasing success; in 1765 he reached the zenith of his powers and reputation. In that year he was represented with no less than thirteen works, amongst which may be cited “La Jeune Fille qui pleure son oseau mort,” “La Bonne Mère,” “Le Mauvais fils puni” (Louvre) and “La Malédiction paternelle” (Louvre). The Academy took occasion to confer on Greuze for his diploma picture. In the following year, on the 13th of March 1805, he died in the Louvre in great poverty. He had been in receipt of considerable wealth, which he had dissipated by extravagance and bad management, so that during his closing years he was forced even to solicit commissions which his enfeebled powers no longer enabled him to carry out with success. The brilliant reputation which Greuze acquired seems to have been due, not to his acquirements as a painter—for his practice is evidently that current in his own day—but to the character of the subjects which he treated. That return to nature which inspired the neoclassicists was, it is true, not the process of a sentimental civilization demanded expression in art. Diderot, in Le Fils naturel et le père de famille, tried to turn the vein of domestic drama to account on the stage; that which he tried and failed to do Greuze, in painting, achieved with extraordinary success, although his works, like the plays of Diderot, were affected by that very artificiality against which they protested. The touch of melodramatic exaggeration, however, which runs through them finds an apology in the firm and brilliant play of line, in the freshness and vigour of the flesh tints, in the enticing softness of expression (often obtained by almost an abuse of mejl), by the alluring air of health and youth, by the sensuous attractions, in short, with which Greuze invests his lessons of bourgeois morality. As Diderot said of “La Bonne Mère,” “ça prêche la population;” and a certain piquancy of contrast is the result which never
fails to obtain admittance. "La Jeune Fille à l'agneau" fetched, I
decided, at the Portalet sale in 1865, no less than 1,000,000 francs.
One of Greuze's pupils, Madame De Lux,imitated with success
the manner of her master; her daughter and granddaughter,
Madame de Valory, also inherited some traditions of his talent.
Madame de Valory published in 1813 a comédie-vaudeville,
Greuze, ou l'accordé de village, to which she prefixed a Notice
of her grandfather's life and works, and the Salons of Diderot also
contain, besides many other particulars, the story at full length
of Greuze's quarrel with the Academy. These most
famous of Greuze's predecessors were entirely entrusted by Greuze
with the reproduction of his productions, but there are also excellent
prints by other engravers, notably by Cars and Le Bas.
See also Normand, J. B. Greuze (1892).
GREVILLE, CHARLES CAVENDISH FULKE (1794-1865),
English diarist, a great-grandson by his father of the 6th earl of
Warwick, and son of Lady Charlotte Bentinck, daughter of the
duke of Portland, formerly a leader of the Whig party, and
first minister of the crown, was born on the 2nd of April 1794.
Much of his childhood was spent at his grandfather's house
at Bulstrode. He was one of the pages of George III., and
was educated at Eton and Christ Church, Oxford; but he left the
university early, having been appointed private secretary to
Earl Bathurst before he was twenty. The interest of the duke
of Portland had secured for him the secretariatship of the island
of Jamaica, which was a sinecure office, the duties being per-
formed by a deputy, and the reversion of the clerkship of
the council. Greville entered upon the discharge of the duties
of clerk of the council in ordinary in 1821, and continued to perform
them for nearly forty years. He therefore served under three
successive sovereigns,—George IV., William IV., and Victoria,—
and although no political or confidential functions are attached
to that office, it is one which brings a man into habitual inter-
course with the chiefs of all the parties in the state. Well-born,
well-bred, handsome and accomplished, Greville led the easy
life of a man of fashion, taking an occasional part in the transac-
tions of his day and much consulted in the affairs of private life.
Until 1855 when he sold his stud he was an active member of
the turf, and he trained successively with Lord George Bentinck,
and with the duke of Portland. But the celebrity which now
attaches to him is due to the posthumous publications of a portion of a
Journal or Diary which it was his practice to keep
during the greater part of his life. These papers were
given by him to his friend Mr Henry Reeve a short time before
his death (which took place on the 18th of January 1865), with
an injunction that they should be published, as far as was
feasible, at not too remote a period after the writer's death.
The journals of the reigns of George IV. and William IV. (extending
from 1820 to 1837) were accordingly so published in obedience
to his directions about ten years after that event. Few publica-
tions have been received with greater interest by the public;
five large editions were sold in little more than a year, and the
demand in America was as great as in England. These journals
were regarded as a faithful record of the impressions made on
the mind of a competent observer, at the time, by the events he
witnessed and the persons with whom he associated. Greville
did not stoop to collect or record private scandal. His object
appears to have been to leave behind him some of the materials
of history, by which the men and actions of his own time would
be judged. He records not so much public events as the private
courses which led to them and perhaps no English memoir-
writer has left behind him a more valuable contribution to the
history of the 19th century. Greville published anonymously, in
1845, a volume of the Past and Present Policy of England to
Ireland, in which he advocated the payment of the Roman
Catholic clergy; and he was also the author of several pamphlets
on the events of his day.
His brother, HENRY GREVILLE (1807-1872), attached to
the British embassy in Paris from 1834 to 1844, also kept a diary,
of which part was published by Viscountess Esefield, Leaves from
his thesis being Disputatio medico-physica... de liqueure nervoso. He began observations on the anatomy of plants in 1664, and in 1670 his essay, The Anatomy of Vegetables begun, was communicated to the Royal Society by Bishop Wilkins, on whose recommendation he was in the following year elected a fellow. In 1672, when the essay was published, he settled in London, and soon acquired an extensive practice as a physician. In 1673 he published his Idea of a Phylealogical History, which consisted of papers he had communicated to the Royal Society in the preceding year, and in 1677 he succeeded Henry Oldenburg as secretary of that society. He edited the Philosophical Transactions in 1678-1679, and in 1681 he published "by request" a descriptive catalogue of the rarities preserved at Gresham College, with which were printed some papers he had read to the Royal Society on the Comparative Anatomy of Stomachs and Guts. In 1682 appeared his great work on the Anatomy of Plants, which also was largely a collection of previous publications. It was divided into four books, Anatomy of Vegetables begun, Anatomy of Roots, Anatomy of Trunks and Anatomy of Leaves, Flowers, Fruits and Seeds, and was illustrated with eighty-two plates, while appended to it were seven papers mostly of a chemical character. Among his other publications were Sea-water made Fresh (1684), the Nature and Use of the Salt contained in Epsom and such other Waters (1697), which was a rendering of his Tractus de salis... usu (1605), and Cosmologia sacra (1701). He died suddenly on the 29th of March 1712. Linnaeus named a genus of trees Grewia (nat. ord. Tiliaceae) in his honour.

GREY, CHARLES GREY, 2nd Earl (1704–1845), English statesman, was the eldest surviving son of General Sir Charles Grey, afterwards 1st Earl Grey. He was born at his father's residence, Fallowdon, near Alnwick, on the 13th of March 1704. General Grey (1720–1807), who was a younger son of the house of Grey of Howick, one of the most considerable territorial families in Northumberland, had already begun a career of active service which, like the political career of his son, covered nearly half a century. Before the latter was born, General Grey had served on the staff of Prince Ferdinand of Brunswick in the Seven Years' War and had been wounded at Minden. While the son was making verses at Eton, the father was serving against the revolted colonists in Pennsylvania and New Jersey, and while the young member for Northumberland was denouncing Pitt's war against the Convention, the veteran soldier was destroying the remnant of the French colonial empire by the capture of Martinique and Guadeloupe. When Napoleon threatened an invasion, General Grey took the command of the southern district, and at the peace of Amiens he was rewarded with a peerage, as Baron Grey of Alnwick, being created in 1806 Earl Grey and Viscount Howick. His elder brother, Sir Henry Grey of Howick, the head of the family, had supported the government in parliament. But the political career of young Grey, who was heir-presumptive to the family estates, took a different complexion.

Young Grey expected to reoccupy the seat which had been his uncle's; and his early years were spent in preparation for a parliamentary career. He was sent to Eton, and proceeded thence to Cambridge. William Pitt, a youth five years older, was then in residence as a master of arts, studiously paying court to the Whigs of the university; and at the general election of 1780 he came forward as a candidate for the academical seat. His name stood last on the poll, but he was brought in elsewhere, and his first speech proved him a man of the first mark. The unparalleled successes which followed portended grave changes. Pitt's elevation to the premiership, his brilliant and hard-fought battle in the house, and his complete rout of the Whig party at the general election of 1784, when he came in for Cambridge at the head of the poll, threatened the great territorial interest with nothing less than extinction. It was to this interest that Grey belonged; and hence, when at length returned for Northumberland in 1786, he at once came forward as a vigorous assailant of the ministry. He was defeated in 1790 and 1796, but in 1797 he was returned for Middlesex, and associated with Fox, Burke and Sheridan as a manager in the Hastings impeachment. During the nineteen years which remained of the career of Fox, he followed the great Whig statesman with absolute fidelity, and succeeded him as leader of the party. The shortcomings of Fox's statesmanship were inherited by Grey. Both were equally devoid of political originality, shunned the severer labours of the politician, and instinctively feared any deviation from the traditions of their party. Such men cannot save a party in its decadence, and the history of Fox and Grey has been aptly termed the history of the decline and fall of Whiggism.

The stunning blow of 1784 was the first incident in this history. Its full significance was not at once perceived. An opposition, however weak in the beginning, generally has a tendency to revive, and Grey's early successes in the house helped to revive the Foxites. The European situation became favourable to this revival. The struggle in France for popular rights, culminating in the great Revolution, was watched by Fox with interested sympathy. He affected to regard the domination of Pitt as the domination of the crown, and as leading logically to absolutism, and saw in that popular sympathy for the French Revolution which naturally arose in England an instrument which might be employed to overthrow this domination.

But Pitt gathered the fruits of the windfall. The spread of "Jacobinism," or "French principles," became the pretext on which the stronger half of the opposition went over to the government. Burke led the movement in the Commons, the duke of Portland and Lord Fitzwilliam in the Lords, and with this second incident in the Whig decline began the difficulties of Grey's career. The domination of the premier had already stirred the keenest resentment in the younger and more ambitious members of the Whig party. Freed from the restraint of the steadier politicians under Burke and Portland, the residuum under Fox fell into a series of grave mistakes. Of this residuum Grey became the moving spirit, for though Fox did not check their activity, he disclaimed the responsibility of their policy. Fox had refused to condemn "French principles," and denounced the war with France; but he would take no part in exciting agitation in England. It was otherwise with the restless spirits among whom Grey was found. Enraged by the attitude of Pitt, which was grounded on the support of the constituencies as they then stood, the residuum plotted an ill-timed agitation for parliamentary reform.

The demand for parliamentary reform was as yet a rudimentary stage. Forty years later it had become the demand of an unenfranchised nation, disabused by a sudden spread of political and economical knowledge. It was as yet but the occasional instrument of the scheming politician. Chatham had employed the cry in this sense. The Middlesex agitators had done the same; even the premier of the time, after his accession to power, had sought to strengthen his hands in the same way. But Pitt's hands were now strengthened abundantly whereas the opposition had nothing to lose and much to gain by such a measure. The cry for reform thus became their natural expedient. Powerless to carry reform in the House, they sought to overawe parliament by external agitation, and formed the Society of the Friends of the People, destined to unite the forces of all the "patrician" societies which already existed in the country, and to pour their violence irresolutely on a terrified parliament. Grey and his friends were enrolled in this portentous association, and presented in parliament its menacing petitions. Such petitions, which were in fact violent impeachments of parliament itself, proceeding from voluntary associations having no corporate existence, had been hitherto unknown in the English parliament. They had been well known in the French assembly. They had heralded and furthered the victory of the Jacobins, the dissolution of the constitution, the calling of the Convention and the fall of the monarchy.

The Society of the Friends of the People was originally an after-dinner folly, extemporized at the house of a man who afterwards gained an eardrum by denouncing it as seditious. Fox suggested the idea; Pitt did not contradict it; but Grey was overborne by the fierce Jacobinism of Lauderdale, and avowed himself the parliamentary mouthpiece of this dangerous
agitation. But Pitt, strong in his position, cut the ground from under Grey's feet by suppressing the agitation with a strong hand. The suspension of the Habeas Corpus Act, the Gagging Acts and the state prosecutions form a painful historical episode. But the discredit belongs as much to Grey and Lauderdale as to Pitt. Grey always spoke regretfully of his share in the movement. "One word from Fox," he said, "would have kept me out of all the mess of the Friends of the People. But he never spoke it." It was Grey who moved the impeachment of Pitt, and he next promoted the equally foolish "Secession." Since the parliament did not properly represent the nation, and refused to reform itself or to impeach the minister, nothing remained but to disown it; and the opposition announced their intention of "seceding," or systematically absenting themselves from their places in parliament. This futile movement was originated by Grey, Lauderdale, and the duke of Bedford. It obtained a somewhat wider support. It suited the language of some dispirited politicians like Fox, and the avarice of some lawyers in large practice like Enkin; but sensible politicians at once condemned it. It directly ignored parliamentary government, and amounted to nothing but a pettifogging of revolution. "Secession," said Lord Lansdowne, with characteristic shrewdness, "either means rebellion, or it is nonsense." Pitt easily dashed this feeble weapon from the hands of his opponents. He roused jealousy in the absence by raising the partes and the patriotism of the rest, and thus gradually brought them back. Grey himself reappeared to protest against the union with Ireland.

When Pitt died in 1806 nothing could prevent the reunited opposition from voting Grey for prime minister. In the Broad-bottom ministry was formed under Fox. On his death Grenville became premier, and Grey, now Lord Howick, foreign secretary, and leader of the House of Commons. Disunion, always the bane of English Liberalism, lurked in the coalition, and the Foxites and Grenvillites were only ostensibly at one. Grey opposed the war policy of Grenville; and this policy was not more successful than it had been in the hands of Pitt. And the change from the leadership of Fox to that of Grenville was only too perceptible. Both in court and country Grenville affected the role of Pitt, and assumed a stiff and peremptory attitude which ill became him. An ill-advised dissolution weakened their majority; they lost ground by the "delicate investigation" into the conduct of the princess of Wales; Lord Henry Petty's budget was too specious to command confidence; and the king, fully aware of their weak situation, resolved to get rid of them. When they proposed to concede a portion of the Catholic claims, George refused and demanded of them an undertaking never to propose such a measure again. This was refused, and the Grenville-Grey cabinet retired in March 1807. In the same year Grey's father died, and Grey went to the Upper House. Opposition united Grey and Grenville for a time, but the part were soon justified for the old war question. When Napoleon returned from Elba in 1815, and once more seized the government of France, the same question arose which had arisen in 1792. Was England to go to war for the restoration of the Bourbons? Grenville followed the traditions of Pitt, and supported the ministry in at once renewing hostilities. Grey followed those of Fox, and maintained the right of France to choose her own governors, and the impossibility of checking the reaction in the emperor's favour. The victory of Waterloo put an end to the dispute, but the dissolution being on the point of occurring, the termination of the war, and the cessation of all action in common, reduced the power of the opposition to nothing. Grenville retired from public life, and his adherents reinforced the ministry. Little remained for the Whigs to do. But the persecution of the queen afforded an opportunity of showing that the ministry were not omnipotent; and the part taken on that occasion by Grey won him at once the increased respect of the nation and the undying aversion of George IV. It sealed the exclusion of himself and his few friends from office during the king's life; and when in 1827 Grey came forth to demand the resignation of the ministry of Canning, he declared that he stood alone in the political world. His words were soon justified, for when Lord Goderich resigned, the remnant which had hitherto supported Grey, hastened to support the ministry of the duke of Wellington.

We now reach the principal episode in Grey's career. In 1827 he seemed to stand forth the solitary and powerless relic of an extinct party. In 1832 we find that party restored to its old numbers and activity, supreme in parliament, popular in the nation, and Lord Grey at its head. The duke of Wellington's foolish declaration against parliamentary reform, made in a season of great popular excitement, suddenly deprived him of the confidence of the country, and a coalition of the Whigs and Canningites became inevitable. The Whigs had in 1827 supported the Canningites; the latter now supported the Whigs, of whom Grey remained the traditional head. George IV. was dead, and no obstacle existed to Grey's elevation. Grey was sent for by William IV. in November 1830, and formed a coalition cabinet, pledged to carry on the work in which the duke of Wellington had faltered. But Grey himself was the mere instrument of the times. An old-fashioned Whig, he had little personal sympathy with the popular cause, though he had some confidence indicated a certain measure of reform as necessary. When he took office, he guessed neither the extent to which the Reform Act would go, nor the means by which it would be carried. That he procured for the country a measure of constitutional reform for which he had agitated in his youth was little more than a coincidence. In his youth he had put himself at the head of a frantic agitation against parliament, because he there found himself powerless. In his old age the case was reversed. Suddenly raised to a position of authority in the country, he was able to check the growth of a formidable agitation which now threatened it and by a forced reform saved it from revolution. In his youth he had assailed Pitt's administration because Pitt's administration threatened with extinction the political monopoly of that landed interest to which he belonged. In his old age, on the contrary, unable to check the progress of the wave, he swam with it, and headed the movement which compelled that landed interest to surrender its monopoly.

The second reading of the first Reform Bill was carried in the Commons by a majority of one. This was equivalent to a defeat, and further failures precipitated a dissolution. The mood in which the bold action of the ministry had won was soon plainly proved, for the second reading was carried in the new parliament by a majority of 136. When the bill had at length passed the Commons after months of debate, it was Grey's task to introduce it to the Lords. It was rejected by a majority of 41. The safety of the country now depended on the prudence and courage of the ministry. The resignation of Grey and his colleagues was dreaded even by the opposition, and they remained in office with the intention of introducing a third Reform Bill in the next session. The last months of 1831 were the beginning of a political crisis such as England had not seen since 1688. The two extreme parties, the Ultra-Radicals and the Ultra-Tories, were ready for civil war. Between them stood the ministry and the majority of intelligent peace-loving Englishmen; and their course of action was soon decided. The bill must be passed, and there were but two ways of passing it. One was to declare the consent of the House of Lords unnecessary to the measure, the other to create, if necessary, new peers in sufficient number to outvote the opposition. These two expedients did not in reality differ. To swamp the house in the way proposed would have been to destroy it. The question whether the ministry should demand the king's consent to such a creation, if necessary, was debated in the cabinet in September. Brougham proposed it, and gradually a majority of the cabinet were won over. Grey had at first refused to employ even the threat of so unconstitutional a device as a means to the proposed end. But his continued refusal would have broken up the ministry, and the breaking up of the ministry must now have been the signal for revolution. The second reading in the Commons was passed in December by a majority of 162, and on New-Year's day 1832 the majority of the cabinet resolved on demanding power to carry it in the Lords by a creation of peers. Grey carried the resolution to the king.
Some time still remained before the bill could be committed and read a third time. It was not until the 9th of April that Grey moved the second reading in the Lords. A sufficient number of the opposition temporized; and the second reading was allowed to pass by a majority of nine. Their intention was to mutilate the bill in committee. The Ultra-Tories, headed by the duke of Wellington, had expressed their protest against the second reading, but they were now politically powerless. The struggle had become a struggle on the one hand for the whole bill, to be carried by a creation of peers, and on the other for some mutilated measure. Grey's instinct divined that the crisis was approaching. Either the king must consent to swamp the House, or the ministry must cease to stand in the breach between the peers and the country. The king, a weak and inexperienced politician, had in the meantime been wrung upon by the temporizing leaders in the Lords. He was induced to believe that if the Commons should reject the mutilated bill when it was returned to them, and the ministry should consequently retire, the mutilated bill might be reintroduced and passed by a Tory ministry. He was deaf to all representations of the state of public opinion; and to the surprise of the ministry, and the terror and indignation of every man of sense in the country, he rejected their proposal and accepted their resignation, May 9, 1832. The duke of Wellington undertook the hopeless task of constructing a ministry which should pass a restricted or sham Reform Bill. The only man who could have made the success of such a ministry even possible was Lord Grey himself, with his principles, his conscience and good sense, forbade the attempt. He refused, and after a week of the profoundest agitation throughout the country, the king, beaten and mortified, was forced to send for Grey and Brougham. On being told that his consent to the creation of peers was the only condition on which they could undertake the government, he angrily and reluctantly yielded. The chancellor, with cool forethought, demanded this consent in writing. Grey thought such a demand harsh and unnecessary. "I wonder," he said to Brougham, when the interview was over, "you could have had the heart to press it." But Brougham was inexorable, and the king signed the following paper: "The king grants permission to Earl Grey, and to his chancellor, Lord Brougham, to create such a number of peers as will be sufficient to ensure the passing of the Reform Bill, first calling up peers' eldest sons.—William R., Windsor, May 17, 1832."

Grey had now won the game. There was no danger that he would have to resort to the expedient which he was authorized to employ. The introduction of sixty new peers would have destroyed the opposition, but it would have been equivalent to the abolition of the House. The king made himself inefficient, and had been unwilling to order his peers to pass the bill to pass, and thus the dignity of both king and peerage would be saved. The duke of Wellington headed this movement on the part of the opposition; and the third reading of the bill was carried in the Lords by a majority of 84.

It is well known that in after years both Grey and Brougham disclaimed any intention of executing their threat. If this were so, they must have merely pretended to a danger which they secretly feared to face, and intended to avoid; and the credit of their names is not assailed by this partial admission of guilt. But the king, Wellington and the peers who secided with him. To argue such cowardice in them from statements made when the crisis was long past, and when they were naturally willing to palliate the rough policy which they were forced to adopt, would be to set up a needless and unjustifiable paradox. Nothing else in the career of either Grey or Brougham leads us to suppose them capable of the moral baseness of yielding up the helm of state, in an hour of darkness and peril, to reckless and unskilled hands. Such would have been the result if they had lacked the determination to carry out their programme to the end. The influence of every statesman in the country would then have been extinguished, and the United Kingdom would have been absolutely in the hands of O'Connell and Orator Hunt.

Grey took but little part in directing the legislation of the reformed parliament. Never anxious for power, he had executed the arduous task of 1831-1832 rather as a matter of duty than of inclination, and wished for an opportunity of retiring. Such an opportunity very shortly presented itself. The Irish policy of the ministry had not conciliated the Irish people, and O'Connell denounced them with the greatest bitterness. On the renewal of the temporary Government Bill, the ministry decided a question whether to continue to the lord-lieutenant the power of suppressing public meetings. Littleton, the Irish secretary, was for abolishing it; and with the view of conciliating O'Connell, he informed him that the ministry intended to abandon it. But the result proved him to have been mistaken, and O'Connell, with some reason supposing himself to have been duped, called on Littleton to resign his secretaryship. It had also transpired in the discussion that Lord Althorp, the leader of the House of Commons, was privately opposed to retaining those clauses in which it was his duty to push through the house. Lord Althorp therefore resigned, and Grey, who had lately passed his seventieth year, took the opportunity of resigning also. It was his opinion, it appeared, which had overborne the cabinet in favour of the public meeting clauses; and his voluntary withdrawal enabled Lord Althorp to return to his post and to proceed with the bill in its milder form. Grey was succeeded by Lord Melbourne; but no other change was made in the cabinet. Grey took no further part in politics. During most of his remaining years he continued to live in retirement at Howick, where he died on the 1st of July 1845, in his eighty-second year. By his wife Mary Elizabeth, only daughter of the first Lord Ponsonby, whom he married on the 18th of November 1794, he became the father of ten sons and five daughters. Grey's eldest son Henry (q.v.) became the 3rd Earl, and among his other sons were General Charles Grey (1804-1870) and Admiral Frederick Grey (1805-1878). In public life, Grey could always be upon occasion bold, strenuous and self-sacrificing; but he was little disposed for the active work of the politician. He was not one of those who took the statesman's duty "as a pleasure he was to enjoy." A certain stiffness and reserve were in him a part of his character, and it was his oratory of the kind which stirs enthusiasm and delight. A tall, stately figure, fine voice and calm aristocratic bearing reminded the listener of Pitt rather than of Fox, and his speeches were constructed on the Attic rather than the Asiatic model. Though simple and straightforward, they never lacked either point or dignity; and they were admirably adapted to the audience to which they were addressed. The scrupulous uprightness of Grey's political and private character completed the ascendancy which he gained; and no politician could be named who, without being a statesman of the highest class, had not a nobility of principle, a tenacity of purpose, and a spirit of thorough straightforwardness and grit, and as one who would maintain British interests independently of party; and he shared with Mr. Asquith the reputation of being the ablest of the Imperialists who followed Lord Rosbery. Though outside foreign affairs he played but a small part in the period of Liberal opposition between 1855 and 1905, he retained public confidence as one who was indispensable to a Liberal administration. When Sir Henry Campbell-Bannerman's cabinet was formed in December 1905 he became foreign minister, and he maintained this office when in April 1908 Mr. Asquith became prime minister.

GREY, SIR GEORGE (1812-1898), British colonial governor and statesman, only son of Lieutenant-Colonel Grey of the 30th Foot, was born in Lisbon on the 14th of April 1812, eight days after the death of his father at the storming of Badajoz.
He passed through Sandhurst with credit, and received his commission in 1829. His lieutenancy was dated 1832, and his captaincy in 1839, in which year he sold out and left the army. In the early ’thirties he was quartered in Ireland, where the wretchedness of the poorer classes left a deep impression on his mind. In 1836 the Royal Geographical Society accepted his offer to explore the north-west region of West Australia, and accordingly he landed at Hanover Bay at the end of 1837. The surrounding country he found broken and difficult, and his hardships were aggravated by the tropical heat and his ignorance of the continent. In a skirmish with the natives, in which he was severely wounded near the bay, he showed great courage, and put the assailants to flight, shooting the chief, who had wounded him. After a brave endeavour to continue his journey his wounded force compelled him to retreat to the coast, whence he sailed to Mauritius to recruit. Next year he again essayed exploration, this time on the coast to the north and south of Shark’s Bay. He had three whale-boats and an ample supply of provisions, but by a series of disasters his stores were spoilt by storms, his boats wrecked in the surf, and the party had to tramp on foot from Gantheaume Bay to Perth, where Grey, in 1839, walked in about the only clothing they did not know. In 1839 he was appointed governor-resident at Albany, and during his stay there married Harriett, daughter of Admiral Spencer, and also prepared for publication an account, in two volumes, of his expeditions. In 1840 he returned to England, to be immediately appointed by Lord John Russell to succeed Colonel Gawler as governor of South Australia. Reaching the colony in May 1841, he found it in the depths of a depression caused by mismanagement and insane land speculation. By rigorously reducing public expenditure, and forcing the settlers to quit the town and betake themselves to tilling their lands, and with the opportune help of valuable copper discoveries, Grey was able to aid the infant colony to emerge from the slough. So striking were his energy and determination that when, in 1845, the little settlements in New Zealand were found to be involved in a native war, and on the verge of ruin, he was sent to save them. The Maori chiefs in open rebellion were defeated, and made their submission. Another powerful leader suspected of fomenting discontent was arrested, and friendly chieftains were subsidized and honored. Bands of the natives were employed in making government roads, and were paid good wages. The governor gained the veneration of the Maori tribes, in whose welfare he took a close personal interest, and of whose legends and myths he made a valuable and scholarly collection, published in New Zealand in 1853 and reprinted thirty years afterwards. With peace prosperity came to New Zealand, and the colonial office desired to give the growing settlements full self-government. Grey, arguing that this would renew war with the Maori, returned the constitution to Downing Street. But though the colonial office sustained him, he became involved in harassing disputes with the colonists, who organized an active agitation for autonomy. In the end a second constitution, partly framed by Grey himself, was granted them, and Grey, after eight years of despotistic but successful rule, was transferred to Cape Colony. He had been knighted for his services, and had undoubtedly shown strength, dexterity and humanity in dealing with the whites and natives. In South Africa his success continued. He thwarted a formidable Zafir rebellion in the Eastern Provinces, and pushed on the work of settlement by bringing out men from the German Legion and providing them with homes. He gained the respect of the British, the confidence of the Boers, the admiration and the trust of the natives. The Dutch of the Free State and the Basuto chose him as arbitrator of their quarrels. When the news of the Indian Mutiny reached Cape Town he strained every nerve to help Lord Canning, despatching men, horses, stores and £50,000 in specie to Bombay. He persuaded a detachment, then on its way round the Cape as a reinforcement for Lord Elgin in China, to divert its voyage to Calcutta. Finally, in 1859, Grey almost reached what would have been the culminating point of his career by federating South Africa. Persuaded by him, the Orange Free State passed resolutions in favour of this great step, and their action was welcomed by Cape Town. But the colonial office disapproved of the change, and when Grey attempted to persevere with it Sir Edward Bulwer Lytton recalled him. A change of ministry during his voyage to England displaced Sir Edward Bulwer Lytton. But though the duke of Newcastle reinstated Grey, it was with instructions to let federation drop. In 1861 the colonial office sent him, for the fourth time in succession, to take up a post of exceptional difficulty by again entrusting him with the governorship of New Zealand, where an inglorious native war in Taranaki had just been succeeded by an armed truce. Grey did his best to make terms with the Maori king and the land league of tribes formed to stop further sales of land to the whites. But the Maori had got guns and powder, and were suspicious and truculent. In vain Grey, supported by Bishop Selwyn and by Fox and the peace party among the settlers, strove to avert war. It came in 1863, and spread from province to province. Ten thousand regulars and as many colonial riflemen were employed to put it down. The imperial troops were badly handled, and Grey, losing patience, became involved in bitter disputes with his commanders. As an example to the former he himself attacked and captured Weraoo, the strongest of the Maori stockades, with a handful of militia, a feat which delighted the colonists, but made him as much disliked at the war office as he now was at Downing Street. Moreover, Grey had no longer real control over the islands. New Zealand had become a self-governing colony, and though he vindicated the colonists generally when tedious imputations of cruelty and land-grabbing were freely made against them in London, he crossed swords with his ministers when the latter confiscated three million acres of tribal land belonging to the insurgent Maori. Yet through all these troubles progress was made; many successes were gained in 1866, chiefly by the colonial militia, and a condition of something like tranquillity had been reached in 1867, when he received a curt intimation from the duke of Buckingham that he was about to be superseded. The colonists, who believed he was sacrificed for upholding their interests and good name, bade farewell to him in 1868 in an outburst of gratitude and sympathy; but his career as a colonial governor was at an end. Returning to England, he tried to enter public life, delivered many able speeches advocating what later came to be termed Imperialism, and stood for Newark. Discouraged, however, by the official Liberals, he withdrew and turned again to New Zealand. In 1872 he was given a pension of £1000 a year, and settled down on the island of Kauai, not far from Auckland, which he bought, and where he passed his leisure in planting, gardening and collecting books. In 1875, on the invitation of the Auckland settlers, he became superintendent of their province, and entered the New Zealand House of Representatives to resist the abolition of the provincial councils of the colony, a change then being urged on by Sir Julius Vogel in alliance with the Centrist Party. In this he failed, but his eloquence and courage drew round him a strong Radical following, and gave him the premiership in 1877. Manhood suffrage, triennial parliaments, a land-tax, the purchase of large estates and the popular election of the governor, were leading points of his policy. All these reforms, except the last, he lived to see carried; none of them were passed by him. A commercial depression in 1879 shook his popularity, and on the fall of his ministry in 1879 he was deposed, and for the next fifteen years remained a solitary and pathetic figure in the New Zealand parliament; repeatedly offered a peerage, he never listened to it, and again invited to lead. In 1891 he came before Australia as one of the New Zealand delegates to the federal convention at Sydney, and characteristically made his mark by standing out almost alone for “one man one vote” as the federal franchise. This point he carried, and the Australians thronged to bear him, so that his visits to Victoria and South Australia were personal triumphs. When, too, in 1894, he quitted New Zealand for London, some repatriation was at last made him by the imperial government; he was called to the privy council, and graciously received by Queen Victoria on his visit to Windsor. Thereafter
GREY, 3RD EARL—GREY, LADY JANE

be lived in London, and died on the 20th of September 1898. He was given a public funeral at St Paul's. Grey was all his life a collector of books and manuscripts. After leaving Cape Colony, he gave his library to Cape Town in 1862; his subsequent collection, which numbered 12,000 volumes, he presented to the citizens of Auckland in 1887. In gratitude the people of Cape Town erected a statue of him opposite their library building.

_Lives of Sir George Grey have been written by W. L. and L. Rees (1892), Professor G. C. Henderson (1907) and J. Collier (1861) (W. P. R.).

GREY, HENRY GREY, 3RD EARL (1802–1894), English statesman, was born on the 28th of December 1802, the son of the 2nd Earl Grey, prime minister at the time of the Reform Bill of 1832. He entered parliament in 1826, under the title of Viscount Howick, as member for Winchelsea, which constituency he left in 1831 for Northumberland. On the accession of the Whigs to power in 1830 he was made under-secretary for the colonies, and laid the foundation of his intimate acquaintance with colonial questions. He belonged at the time to the more advanced party of colonial reformers, sharing the views of Edward Gibbon Wakefield on questions of land and emigration, and resigned in 1834 from dissatisfaction that slave emancipation was made gradual instead of immediate. In 1835 he entered Lord Melbourne's cabinet as secretary at war, and effected some valuable administrative reforms, especially by suppressing malpractices detrimental to the troops in India. After the partial reconstruction of the ministry in 1839 he again resigned, disapproving of the more advanced views of some of his colleagues. These repeated resignations gave him a reputation for crotchety- ness, which he did not decrease by his disposition to embarrass his old colleagues by his action on free trade questions in the session of 1841. During the exile of the Liberals from power he went still farther on the path of free trade, and anticipated Lord John Russell's declaration against the corn laws. When, on Sir Robert Peel's resignation in December 1845, Lord John Russell was called upon to form a ministry, Howick, who had become Earl Grey by the death of his father in the preceding July, refused to enter the new cabinet if Lord Palmerston were foreign secretary (see J. R. Thurfitt in vol. i. and Hon. F. H. Baring in vol. xxii. of the English Historical Review). He was greatly censured for perverseness, and particularly when in the following July he accepted Lord Palmerston as a colleague without remonstrance. His conduct, nevertheless, afforded Lord John Russell an escape from an embarrassing situation. Becoming colonial secretary in 1846, he found himself everywhere confronted with arduous problems, which in the main he encountered with success. His administration formed an epoch. He was the first minister to proclaim that the colonies were to be governed for their own benefit and not for the mother-country. The first truly self-governing constitution had been in operation so far as then seemed possible; the first to introduce free trade into their relations with Great Britain and Ireland. The concession by which colonies were allowed to tax imports from the mother-country _ad libitum_ was not his; he protested against it, but was overruled. In the West Indies he suppressed, if he could not overcome, discontent; in Ceylon he put down rebellion; in New Zealand he suspended the constitution he had himself accorded, and yielded everything into the masterful hands of Sir George Grey. The least successful part of his administration was his treatment of the convict question at the Cape of Good Hope, which seemed an exception to his rule that the colonies were to be governed for their own benefit and in accordance with their own wishes, and subjected him to a humiliating defeat. After his retirement he wrote a history and defence of his colonial policy in the form of letters to Lord John Russell, a dry but instructive book (Colonial Policy of Lord John Russell's Administration, 1853). He resigned with his colleagues in 1852. No room was found for him in the Coalition Cabinet of 1855, and although during the Crimean struggle public opinion pointed to him as the fittest man as minister for war, he never again held office. During the remainder of his long life he exercised a vigilant criticism on public affairs. In 1858 he wrote a work (republished in 1864) on parliamentary reform; in 1888 he wrote another on the state of Ireland; and in 1892 one on the United States tariff. In his latter years he was a frequent contributor of weighty letters to _The Times_ on land, tithes, currency and other public questions. His principal parliamentary appearances were when he moved for a committee on Irish affairs in 1866, and when in 1878 he passionately opposed the policy of the Beaconsfield cabinet in India. He nevertheless supported Lord Beaconsfield at the dissolution, regarding Mr Gladstone's accession to power with much greater alarm. He was a determined opponent of Mr Gladstone's Home Rule policy. He died on the 9th of October 1894. None ever doubted his capacity or his conscientiousness, but he was generally deemed impracticable and disagreeable. Prince Albert, however, who expressed himself as ready to subscribe to all Grey's principles, and applauded him for having principles, told Stockmar that, although dogmatic, he was amenable to argument; and Sir Henry Taylor credits him with "more freedom from littlenesses of feeling than I have met before in any public man." His chief defect was perceived, and it will appear that even if the crown of England had ever fallen into the female line of descent from Henry VII., she could not have put in a rightful claim unless the issue of his elder daughter, Margaret, had become extinct. But Margaret had married James IV. of Scotland; and, though her descendant, James VI., was ultimately called to the English throne, Henry VIII. had placed her family after that of his second sister in the succession; so that, failing the lawful issue of Henry himself, Lady Jane would, according to this arrangement, have become queen. It was to these circumstances that she owed her exceptional position in history, and became the victim of an ambition which was not her own.

She was born at her father's seat named Bradgate in Leicester- shire about the year 1537. Her parents, though severe disciplinarians, bestowed more than ordinary care upon her education, and she herself was so teachable and delighted so much in study that she became the marvel of the age for her acquirements. She not only excelled in needlework and in music, both vocal and instrumental, but while still very young she had thoroughly mastered Latin, Greek, French and Italian. She was able to speak and write both French and Latin with an accuracy that satisfied even such critics as Ascham and her tutor Dr Aylmer, afterwards bishop of London. She also acquired some knowledge of at least three Oriental tongues, Hebrew, Chaldee and Arabic. In Ascham's _Schoolmaster_ is given a touching account of the devotion with which she pursued her studies and the harshness she experienced from her parents. The love of learning was her solace; in reading Demosthenes and Plato she found a refuge from domestic unhappiness. When about ten years old she was placed for a time in the household of Thomas, Lord Seymour, who, having obtained her wardship, induced her parents to let her stay with him, even after the death of his wife, Queen
Unfortunately, owing to the general dislike of the queen's marriage with Philip of Spain, Sir Thomas Wyatt soon after raised a rebellion in which the duke of Suffolk and his brothers took part, and on its suppression the queen was persuaded that it was unsafe to spare the lives of Lady Jane and her husband any longer. On hearing that they were to die, Lady Jane declined a parting interview with her husband lest it should increase their pain, and prepared to meet her fate with Christian fortitude. She and her husband were executed on the same day, on the 12th of February 1554, her husband on Tower Hill, and herself within the Tower an hour afterwards, amidst universal sympathy and compassion.

GREY DE WILTOn and GREY DE RUTHYN. The first Baron Grey de Wiltin was Reginald de Grey, who was summoned to parliament as a baron in 1295 and who died in 1306. Reginald's son John, the 2nd baron (1266-1323), was one of the lords protectors in 1310 which in effect gave him reign in England. There were at least six other barons of that name, all having the surname Grey. They were descended from John's eldest son Henry (d. 1342), while a younger son Roger (d. 1355) was the ancestor of the barons Grey de Ruthyn.

WILLIAM, 13th LORD GREY DE WILTON (d. 1562), who succeeded to the title on the death of his brother Richard, about 1520, won great fame as a soldier by his conduct in France during the concluding years of Henry VIII.'s reign, and was one of the leaders of the victorious English army at the battle of Ptıké in 1547. He was then employed on the Scottish marches and in Scotland, and in 1549 he rendered good service in suppressing the rebellion in Oxfordshire and in the west of England; in 1551 he was imprisoned as a friend of the fallen protector, the duke of Somerset, and he was concerned in the attempt made by John Dudley, duke of Northumberland, to place Lady Jane Grey on the English throne in 1553. However, he was pardoned by Queen Mary and was entrusted with the defence of Guines. Although indifferently supported he defended the town with great gallantry, but in January 1558 he was forced to surrender and for some time he remained a prisoner in France. Under Elizabeth, Grey was again employed on the Scottish border, and he was responsible for the pertinacious but unavailing attempt to capture Leith in May 1560. He died at Cheshunt in Hertfordshire on the 14th/25th of December 1562.

He was described by William Cecil as "a noble, valiant, painful and careful gentleman," and his son and successor, Arthur, wrote *A Catalogue of the Armies of William, Lord Grey of Wilton, K.G.* This has been edited by Sir P. de M. Grey Egerton for the Camden Society (1847).

Grey's eldest son ARTHUR, 14th LORD GREY DE WILTON (1556-1593), was during early life with his father in France and in Scotland; he fought at the battle of St Quentin and helped to defend Guines and to assault Leith. In July 1580 he was appointed lord deputy of Ireland, and after an initial defeat in Wicklow was successful in reducing many of the rebels to a temporary submission. Perhaps the most noteworthy event during his tenure of this office was the massacre of 600 Italians and Spaniards at Smerrick in November 1580, an action for which he was responsible. Having incurred a heavy burden of debt Grey frequently implored the queen to recall him, and in August 1582 he was allowed to return to England (see E. Spenser, *View of the State of Ireland*, edited by H. Morley, 1890, and R. Bagwell, *Ireland under the Tudors*, vol. iii., 1890). While in Ireland Grey was served as secretary by Edmund Spenser, and in book v. of the *Faerie Queene* the poet represents his patron as a knight of very noble qualities named Aragall. As one of the commissioners who tried Mary queen of Scots, Grey defended her action in during the captivity of the Queen. He also took part in the preparations for the defence of England against the Spaniards in 1588. His
account of the defence of Guanes was used by Holinshed in his Chronicles.

When he died on the 14th of October 1593 he was succeeded as 15th baron by his son Thomas (d. 1614), who while serving in Ireland incurred the enmity of Robert Devereux, earl of Essex, and of Henry Wriothesley, earl of Southampton; and after fighting against Spain in the Netherlands he was a member of the court which sentenced these two noblemen to death in 1601. On the accession of James I. he was arrested for his share in the "Bewe" plot, an attempt made by William Watson and others to murder the king. He was tried and pronounced to die; but the sentence was not carried out and he remained in prison until his death on the 9th of July 1614. He displayed both ability and courage at his trial, remarking after sentence had been passed, "the house of Wilton hath spent many lives in their prince's service and Grey cannot beg his." Like his father Grey was a strong Puritan. He left no children and his barony became extinct.

In 1784 Sir Thomas Egerton, Bart., a descendant in the female line of the 14th baron, was created Baron Grey de Wilton. He died without sons in September 1814, when his barony became extinct; but the titles of Viscount Grey de Wilton and earl of Wilton, which had been conferred upon him in 1801, passed to Thomas Grosvenor (1799–1882), the second son of his daughter Eleanor (d. 1846), and his husband Robert Grosvenor, 1st marquess of Westminster. Thomas took the name of Egerton and his descendants still hold the titles.

Roger Grey, 1st Baron Grey de Ruthyn, who was summoned to parliament as a baron in 1324, saw much service as a soldier before his death on the 6th of March 1353. The second baron was his son Reginald, whose son Reginald (c. 1362–1440) succeeded to the title on his father's death in July 1388. In 1410 after a long dispute the younger Reginald won the right to bear the arms of the Hastings family. He was one of the few noblemen both of Richard II. and Henry IV., and his chief military exploits were against the Welsh, who took him prisoner in 1402 and only released him upon payment of a heavy ransom. Grey was a member of the council which governed England during the absence of Henry V. in France in 1415; he fought in the French wars in 1420 and 1421 and died on the 30th of September 1440. His eldest son, Sir John Grey, K.G. (d. 1439), who predeceased his father, fought at Agincourt and was deputy of Ireland in 1427. He was the father of Edmund Grey (d. 1480), who succeeded his grandfather as Lord Grey de Ruthyn in 1440 and was created earl of Kent in 1465.

One of Reginald Grey's younger sons, Edward (1415–1457), succeeded his maternal grandfather as Baron Ferrers of Groby in 1445. He was the ancestor of the earls of Stamford and also of the Grey family of Ratho.

The barony of Grey de Ruthyn was merged in the earldom of Kent until the death of Henry, the 8th earl, in November 1639. It was restored to the Grey family in the next generation; Sir George Grey, of Longueville, born 1643, through whose daughter Susan (d. 1670) it came to the family of Yelverton, who were earls of Sussex from 1717 to 1799. The next holder was Henry Edward Gould (1780–1810), a grandson of Henry Yelverton, earl of Sussex; and through Gould's daughter Barbara, marchioness of Hastings (d. 1858), it passed to the last marquess of Hastings, on whose death in 1868 the barony fell into abeyance, this being terminated in 1885 in favour of Hastings' sister Bertha (d. 1887), the wife of Augustus Wykeham Clifton. Their son Rawdon George Grey Clifton (b. 1858), succeeded his mother as 24th holder of the barony.

Greymouth, a seataport of New Zealand, the principal port on the west coast of South Island, in Grey county. Pop. (1906) 4369. It stands on the small estuary of the Grey or Mawhera river, has a good harbour, and railway communication with Hokitika, Reefton, &c., while the construction of a line to connect with Christchurch and Nelson was begun in 1887. The district is both auriferous and coal-bearing. Gold-dredging is a rich industry, and the coal-mines have attendant industries in coke, bricks and fire-clay. The timber trade is also well developed. The neighbouring scenery is picturesque, especially among the hills surrounding Lake Brunner (15 m. S.E.).

Greytown (San Juan del Norte), the principal seaport on the Caribbean coast of Nicaragua, in the extreme south-eastern corner of the republic, and at the mouth of the northern channel of the San Juan river delta. Pop. (1905) about 2900. The town occupies the seaward side of a narrow peninsula, formed by the windings of the river. Most of its houses are raised on piles 2 or 3 ft. above the ground. The neighbourhood is unhealthy and unsuited for agriculture, so that almost all food-stuffs must be imported, and the cost of living is high. Greytown has suffered severely from the accumulation of sand in its once fine harbour. Between 1832 and 1848 Point Arenas, the seaward end of the peninsula, was enlarged by a sandbank more than 1 m. long; between 1850 and 1875 the depth of water over the bar decreased from about 25 ft. to 5 ft., and the entrance channel, which had been navigable, was almost closed. Subsequent attempts to improve the harbour by dredging and building jetties have only had partial success; but Greytown remains the headquarters of Nicaraguan commerce with Europe and eastern America. The village called America, 1 m. N., was built as the eastern terminus of a proposed interoceanic canal.

The harbour of San Juan, discovered by Columbus, was brought into further notice by Captain Diego Machuca, who in 1520 sailed down the river from Lake Nicaragua. The date of the first Spanish settlement on the spot is not known, but in the 17th century there were fortifications at the mouth of the river. In 1796 San Juan was made a port of entry by royal charter, and new defences were erected in 1821. In virtue of the protectorate claimed by Great Britain over the Mosquito Coast (q.v.), the Mosquito Indians, aided by a British force, seized the town in 1848 and occupied it until 1860, when Great Britain ceded its protectorate to Nicaragua by the treaty of Managua. This treaty secured religious liberty and trial by jury for all civil and criminal charges in Greytown; its seventh article declared the port free, but was never enforced.

Greywacke, or Greywacke (a German word signifying a grey earthy rock), the designation, formerly more generally used by English geologists than at the present day, for impure, highly composite, gritty rocks belonging to the Palaeozoic systems. They correspond to the sandstones, grits and fine conglomerates of the later periods. Greywackes are mostly grey, brown, yellow or black, dull-coloured, sandy rocks which may occur in thick or thin beds along with slates, limestones, &c., and are abundant in Wales, the south of Scotland and the Lake district of England. They contain a very great variety of minerals, of which the principal are quartz, orthoclase and plagioclase, calcite, iron oxides and graphic carbonate matters, together with (in the coarser kinds) fragments of such rocks as felsite, chert, slate, gneiss, various schists, quartzite. Among other minerals found in them are biotite and chlorite, tourmaline, epidote, apatite, garnet, hornblende and augite, sphene, pyrites. The cementing material may be siliceous or argillaceous, and is sometimes calcareous. As a rule greywackes are not fossiliferous, but organic remains may be common in the finer beds associated with them. Their component particles are usually not much rounded by attrition, and the rocks have often been considerably indurated by pressure and mineral changes, such as the introduction of interstitial silica. In some districts the greywackes are cleaved, but they show phenomena of this kind much less perfectly than the slates. Although the group is so diverse that it is difficult to characterize mineralogically, it has a well-established place in petrographical classifications, because these peculiar composite arenaceous deposits are very frequent among Silurian and Cambrian rocks, and rarely occur in Secondary or Tertiary systems. Their essential features are their gritty character and their complex composition. By increasing metamorphism greywackes frequently pass into mica-schists, chloritic schists and sedimentary gneisses.

(G. S. F.)

Gríbeauval, Jean Baptiste de (1715–1780), French artillery general, was the son of a magistrate of Amiens and was born there on the 15th of September 1715. He entered the French royal artillery in 1732 as a volunteer, and became an officer in 1735. For nearly twenty years regimental duty and scientific work occupied him, and in 1752 he became captain of a company of miners. A few years later he was employed in a military mission in Prussia. In 1757, being then a lieutenant—
colonel, he was sent to the Austrian army on the outbreak of the Seven Years' War, and served as a general officer of artillery. The siege of Glatz and the defence of Schweidnitz were his principal exploits. The empress Maria Theresa rewarded him for his work with the rank of lieutenant field-marshal and the cross of the Maria Theresa order. On his return to France he was made maréchal de camp, in 1764 inspector of artillery, and in 1765 lieutenant-general and commander of the order of St Louis. For some years after this he was in disfavour at court, and he became first inspector of artillery only in 1776, in which year he also received the grand cross of the St Louis order. He was now able to carry out the reforms in the artillery arm which are still the weaknesses of the real. His works forming that order is Gribeauval's own Table des constructions des principaux attirails de l'artillerie... de M. de Gribeauval, and the règlement for the French artillery issued in 1776. He died in 1789.

See Puységur in Journal de Paris, supplement of the 8th of July 1789; Chevalier de Passac, Précis sur M. de Gribeauval (Paris, 1816); Veyrines, Gribeauval (Paris, 1889), and Hemébert, Gribeauval, Lieutenant-général des armées de la roy (Paris, 1896).

GRIBOYEDOV, ALEXANDER SERGEUEVICH (1795-1829), Russian dramatic author, was born in 1795 at Moscow, where he began his career as a private in the Russian army from which he obtained a commission in a hussar regiment, but resigned it in 1816.

Next year he entered the civil service, and in 1818 was appointed secretary of the Russian legation in Persia, whence he was transferred to Georgia. He had commenced writing early, and had produced on the stage at St Petersburg in 1816 a comedy in verse, translated from the French, called The Young Spouses, which was followed by other pieces of the same kind. But neither these nor the essays and verses which he wrote would have long been remembered but for the immense success gained by his comedy in verse, Coré et Uro, or Misfortune from Intelligence (Eng. trans. by N. Benarday, 1857). A satire upon Russian society, or, as a high official styled it, "A passquinade on Moscow," its plot is slight, its merits consisting in its accurate representation of certain social and official types—such as Famousoff, the lover of old abuses, the hater of reforms; his secretary, Molchanov, servile fawner upon all in office; the aristocratic young liberal and Anglomaniac, Repetillof; contrasted with them is who is the hero of the piece, Tchatsky, the ironical satirist, just returned from the west of Europe, who exposes and ridicules the weaknesses of the real. His words opening that order is of the young generation of 1820 which reached its climax in the military insurrection of 1825, and was then sternly silenced by Nicholas. Griboyedov spent the summer of 1823 in Russia, completed his play and took it to St Petersburg. There it was rejected by the censorship. Many copies were made and privately circulated, but Griboyedov never saw it published. The first edition was printed in 1833, four years after his death. Only once did he see it on the stage, when it was acted by the officers of the garrison at Erivan. Soured by disappointment he returned to Georgia, made himself useful by his linguistic knowledge to his relative Count Paskievitch-Erivensky during a campaign against Persia, and was sent to St Petersburg with the treaty of 1828. Brilliantly received there, he thought of devoting himself to literature, and commenced a romantic drama, A Georgian Night. But he was suddenly sent to Persia as minister-plenipotentiary. Soon after his arrival at Tehran a tumult arose, caused by the anger of the populace against some Georgian and Armenian captives—Russian subjects—who had taken refuge in the Russian embassy. It was stormed, Griboyedov was killed (February 11, 1828), and his body was for three days so ill-treated by the mob that it was at last recognised only by an old scar on the hand, due to a wound received in a duel. It was taken to Tiflis, and buried in the monastery of St David. There a monument was erected to his memory by his widow, to whom he had been but a few months married.
the range of the appeal in Chopin is far wider, nor has the national movement inaugurated by Grieg shown promise of great development. He is rather to be regarded as the pioneer of a musical mission which has been perfectly carried out by himself alone.

See Max Friedlaender (Leipzig, 1832), for a vivid impression of this bright young Skeu and pleasant humorous face; and Brokman, proud of his pupil, made him translate a chapter from a Hebrew Bible first into Latin and then into Danish, for the entertainment of the scholarly monarch. In 1654 young Schumacher went abroad for eight years, to complete his education. From Germany he proceeded to the Netherlands, staying at Leiden, Utrecht and Amsterdam, and passing in 1657 to Queen's College, Oxford, where he lived three years. The epoch-making events which occurred in England, while he was at Oxford profoundly interested him, and coinciding with the Revolution in Denmark, which threw open a career to the middle classes, convinced him that his proper sphere was politics. In the autumn of 1660 Schumacher visited Paris, shortly after Mazarin's death, when the young Louis XIV. first seized the reins of power. Schumacher seems to have been profoundly impressed by the administrative superiority of a strong centralised monarchy in the hands of an energetic monarch who knew his own mind; and, in politics, as in manners, France ever afterwards was his model. The last year of his travels was spent in Spain, where he obtained a thorough knowledge of the Castilian language and literature. His travels, however, if they enriched his mind, relaxed his character, and he brought home easy morals as well as exquisite manners.

On his return to Copenhagen, in 1662, Schumacher found the monarchy established on the ruins of the aristocracy, and eager to buy the services of every man of the middle classes who had superior talents to offer. Determined to make his way in this "new Promised Land," the young adventurer contrived to secure the protection of Kristoffer Gabel, the king's confidant, and in 1663 was appointed the king's librarian. By a romantic friendship with the king's bastard, Count Ulric Frederick Gyldenløve, consolidated his position. In 1665 Schumacher obtained his first political post as the king's secretary, and the same year composed the memorable Kongelov (see Denmark, History). He was now a personage at court, where he won all hearts by his amiability and gaiety; and in political matters also his influence was beginning to be felt.

On the death of Frederick III. (February 9th, 1670) Schumacher was the most trusted of all the royal counsellors. He was elevated to the nobility, to the new throne of Walrus ivory embellished with three silver life-sizes, and of the new regalia, both of which treasures he had, by the king's command, concealed in a vault beneath the royal castle. Frederick III. had also confided to him a sealed packet containing the Kongelov, which was to be delivered to his successor alone. Schumacher had been recommended to his son by Frederick III. on his deathbed. "Make him a great man, but do it slowly!" said Frederick, who thoroughly understood the characters of his son and of his minister. Christian V. was, moreover, deeply impressed by the confidence which his father had ever shown to Schumacher. When, on the 9th of February 1672, Schumacher delivered the Kongelov to Christian V., the king bade all those about him withdraw, and after being clostet a good hour with Schumacher, appointed him his "Obergeheimsekretär." His promotion was now almost disquietingly rapid. In May 1670 he received the titles of excellency and privy councillor; in July of the same year he was ennobled under the name of Griffenfeld, deriving his title from the gold griffin with outspread wings which surmounted his escutcheon; in November 1673 he was created a baron of the imperial body of nobility, important with the "Unterhaus." In the course of the next few months he gathered into his hands every branch of the government: he had reached the apogee of his short-lived greatness.

But if his offices were manifold, so also were his talents. Seldom has any man united so many and such various gifts in his own person and carried them so easily—a playful wit, a vivid imagination, oratorical and literary eloquence and, above all, a profound knowledge of human nature both male and female,
of every class and rank, from the king to the meanest citizen. He had captured the accomplished Frederick III. by his literary graces and ingenious speculations; he won the obsequious and ignorant Chris-im V. by saving him trouble, by acting and thinking for him, and at the same time making him believe that he was thinking and acting for himself. Moreover, his commanding qualities were coupled with an organizing talent which made itself felt in every department of the state, and with a marvellous adaptability which made him an ideal diplomatist.

On the 25th of May 1671 the dignities of count and baron were introduced into Denmark "to give lustre to the court"; a few months later the order of the chivalry; and finally, because of widespread and frequent expressions of worship by marks of favour. Griffenfeld was the originator of these new institutions. To him monarchy was the ideal form of government. But he had also a political object. The aristocracy of birth, despite its reverses, still remained the elite of society; and Griffenfeld, the son of a burgess as well as the protagonist of monarchy, was its most determined enemy. The new harmonies and countships, owing their existence entirely to the crown, introduced a strong solvent into aristocratic circles. Griffenfeld saw that, in future, the city, the chancellery would be the first everywhere. Much was also done to promote trade and industry, notably by the revival of the Kammer Kollegium, or board of trade, and the abolition of some of the most harmful monopolies. Both the higher and the provincial administrations were thoroughly reformed with the view of making them more centralized and efficient; and the positions and duties of the various magistrates, who now also received fixed salaries, were for the first time exactly defined. But what Griffenfeld could create, Griffenfeld could dispense with, and it was not long before he began to encroach upon the jurisdiction of the new departments of state by private conversations with their chiefs. Nevertheless it is indisputable that, under the single direction of this master-mind, the Danish state was now able, for a time, to utilize all its resources as it had never done before.

In the last three years of his administration, Griffenfeld gave himself entirely to the conduct of the foreign policy of Denmark. It is difficult to form a clear idea of this, first, because his influence was perpetually traversed by opposite tendencies; in the second place, because the force of circumstances compelled him, again and again, to shift his standpoint, and finally because personal considerations largely intermingled with his foreign policy, and made it more elusive and ambiguous than it need have been. Briefly, Griffenfeld aimed at restoring Denmark to the rank of a great power. He proposed to accomplish this by carefully nursing her resources, and in the meantime securing and enriching her by alliances, which would bring in large subsides while imposing a minimum of obligations. Such a conditional and tentative policy, on the part of a second-rate power, in a period of universal tension and turmoil, was most difficult; but Griffenfeld did not regard it as impossible. The first postulate of such a policy was peace, especially peace with Denmark's most dangerous neighbour, Sweden. The second postulate was a sound financial basis, which he expected the wealth of France to supply in the shape of subsidies to be spent on armaments. Above all things Denmark was to beware of making enemies of France and Sweden at the same time. An alliance, on fairly equal terms, between the three powers, would, in these circumstances, be the consummation of Griffenfeld's " system "; an alliance with France to the exclusion of Sweden would be the next best policy; but an alliance between France and Sweden, without the admission of Denmark, was to be avoided at all hazards. Had Griffenfeld's policy succeeded, Denmark might have recovered her ancient possessions to the south and east comparatively cheap. But again and again he was overruled. Despite his open protests and subterraneous counter-mingling, war was actually declared against Sweden in 1675, and his subsequent policy seemed so obscure and hazardous to those who did not possess the clue to the perhaps purposely tangled skein, that the numerous enemies whom his arrogance and superciliousness had raised up against him, resolved to destroy him.

On the 11th of March 1676, while on his way to the royal apartments, Griffenfeld was arrested in the king's name and conducted to the citadel, a prisoner of state. A minute scrutiny of his papers, lasting nearly six weeks, revealed nothing treasonable; but it provided the enemies of the fallen statesman with a deadly weapon against him in the shape of an entry in his private diary, in which he had imprudently noted that on one occasion Christian V. in a conversation with a foreign ambassador had "spoken like a child." On the 3rd of May Griffenfeld was tried not by the usual tribunal, in such cases the Højesteret, or supreme court, but by an extraordinary tribunal of 10 dignitaries, none of whom was particularly well disposed towards Griffenfeld. Griffenfeld, who was charged with simony, bribery, oath-breaking, malversation and lèse-majesté, conducted his own defence under every imaginable difficulty. For forty-six days before his trial he had been closely confined in a dungeon without lights; books or writing materials. Every legal assistance was illegally denied him. Nevertheless he proved more than a match for the forensic ability arrayed against him, and his first plea in defence is in a high degree dignified and manly. Finally, he was condemned to life imprisonment and the sentence was not only refused to sign the sentence, but remonstrated in private with the king against its injustice. And indeed its injustice was flagrant. The primary offence of the ex-chancellor was the taking of bribes, which no twisting of the law could convert into a capital offence, while the charge of treason had not been substantiated. Griffenfeld was pardoned on the scaffold, at the very moment when the axe was about to descend. On hearing that the sentence was commuted to life-long imprisonment, he declared that the pardon was harder than the punishment, and vainly petitioned for leave to serve his king for the rest of his life as a common soldier. For the next two and twenty years Denmark's greatest statesman lingered out his life in a lonely state-prison, first in the fortress of Copenhagen, and finally at Munkholm on Trondhjem fiord. He died at Trondhjem on the 12th of March 1699. Griffenfeld married Kitty Nansen, the granddaughter of the great Burgomaster Hans Nansen, who brought him half a million rix-dollars. She died in 1672, after bearing him a daughter.

GRiffin [O'Griobta, O'Greeva], Gerald (1803-1845), Irish novelist and dramatic writer, was born at Limerick of good family, on the 12th of December 1803. His parents emigrated in 1820 to America, but he was left with an elder brother, who was a medical practitioner at Adare. As early as his eighteenth year he undertook for a short time the editorship of a newspaper in Limerick. Having written a tragedy, Aguire, which was highly praised by his friends, he set out in 1823 for London with the purpose of "revolutionizing the dramatic taste of the time by writing for the stage." In spite of the recommendations of John Banim, he had a hard struggle with poverty. It was only by degrees that his literary work obtained any favour. The Novellas, an opera entirely in recitative, was produced at the English Opera House in 1826; and the success of Holland Tide Tales (1827) led to Tales of the Munster Festivals (3 vols., 1827), which were still more popular. In 1829 appeared his fine novel, The Collegians, afterwards successfully adapted for the stage by Dion Boucicault under the title of The Colleen Bawn. He followed up this success with The Invasion (1832), Tales of my Neighbourhood (1833), The Duke of Menmouth (1836), and Talis Qualis, or Tales of the Jury-room (1842). He also wrote a number of lyrics touched with his native melancholy. But he became doubtful as to the moral influence of his writings, and ultimately he came to the conclusion that his true sphere of duty was to be found within the Church. He was admitted into a society of the Christian Brothers at Dublin, in September 1838, under the name of Brother Joseph, and in the following summer.
he removed to Cork, where he died of typhus fever on the 12th of June 1840. Before adopting the monastic habit he burned all his manuscripts; but Gissippus, a tragedy which he had composed before he was twenty, accidentally escaped destruction, and in 1842 was put on the Drury Lane stage by Macready with great success.

The collected works of Gerald Griffin were published in 1842–1843 in eight volumes, with a Life by his brother William Griffin, M.D.; an edition of his Poetical and Dramatic Works (Dublin, 1895) by C. G. Duffy; and a selection of his lyrics, with a notice by George Sigerson, in the Treasury of Ireland, edited by Stopford A. Brooke and T. W. Rolleston (London, 1900).

Griffin, a city and the county-seat of Spalding county, Georgia, U.S.A., 43 m. S. of Atlanta, and about 970 ft. above the sea. Pop. (1890) 4593; (1900) 6857 (3256 negroes); (1910) 7478. It is served by the Southern and the Central of Georgia railways, and is the southern terminus of the Griffin & Chat- tanooga Division of the latter. The city is situated in a rich agricultural region, and just outside the corporate limits is an agricultural experiment station, established by the state but maintained by the Federal government. Griffin has a large trade in cotton and fruit. The principal industry is the manufacture of cotton and cotton-seed oil. Buggies, wagons, chairs and harness are among the other manufactures. The municipality owns and operates the water and electric-lighting systems.

Griffin was founded in 1840 and was chartered as a city in 1846.

Griffin, Griffin or Gryphon (from Gr. griffin, Lat. gryphus, Gr. γρύφω), in the natural history of the ancients, the name of an imaginary rapacious creature of the eagle and snake, represented with four legs, wings and a beak,—the fore part resembling an eagle and the hinder a lion. In addition, some writers describe the tail as a serpent. This animal, which was supposed to watch over gold mines and hidden treasures, and to be the enemy of the horse, was consecrated to the Sun; and the ancient painters represented the chariot of the Sun as drawn by griffins. According to Spanheim, those of Jupiter and Nemesis were similarly provided. The griffin of Scripture is probably the osprey, and the name is now given to a species of vulture. The griffin was said to inhabit Asiatic Scythia, where gold and precious stones were abundant; and when strangers approached to gather these the creatures leapt upon them and tore them in pieces, thus chastising human avarice and greed. The one-eyed Arimaspes waged constant war with them, according to Herodotus (iii. 16). Sir John de Mandeville, in his Travels, described a griffin as eight times larger than a lion.

The griffin is frequently seen as a charge in heraldry (see Heraldry, fig. 163); and in architectural decoration is usually represented as a four-footed beast with wings and the head of a leopard or tiger with horns, or with the head and neck of an eagle; in the latter case, but very rarely, with two legs. To what extent it owes its origin to Persian sculpture is not known, the capitals at Persepolis have sometimes leopard or lion heads with horns, and four-footed beasts with the beaks of eagles are represented in bas-reliefs. In the temple of Apollo Brandiace near Miletus in Asia Minor, the winged griffin of the capitals has leopards' heads with horns. In the capitals of the so-called lesser propylaea at Eleusis conventional eagles with two feet support the angles of the abacus. The greater number of those in conventional work are found in the temple of Antoninus and Faustina, and their tails develop into conventional foliage. A similar device was found in the Forum of Trajan. The best decorative employment of the griffin is found in the vertical supports of tables, of which there are two or three examples in Pompeii and others in the Vatican and the museums in Rome. In some of these the case the head is that of a lion at one end of the support and an eagle at the other end, and there is only one strongly developed paw; the wings circling round at the top form conspicuous features on the sides of these supports, the surfaces below being filled with conventional Greek foliage.

Griffith, Sir Richard John (1784–1878), Irish geologist, was born in Dublin on the 20th of September 1784. He obtained in 1799 a commission in the Royal Irish Artillery, but a year later, when the corps was incorporated with that of England, he retired, and devoted his attention to civil engineering and mining. He studied chemistry, mineralogy and mining for two years in London under William Nicholson (editor of the Journal of Nat. Phil.), and afterwards examined the mining districts in various parts of England, Wales and Scotland. While in Cornwall he discovered ores of nickel and cobalt in material that had been rejected as worthless. He completed his studies under Robert Jameson and others at Edinburgh, was elected a Fellow of the Royal Society of Edinburgh in 1830, and in 1837, with the newly established Geological Society of London in 1838, and in the same year he returned to Ireland. In 1839 he was appointed by the commissioners to inquire into the nature and extent of the bogs in Ireland, and the means of improving them. In 1832 he was elected professor of geology and mining engineer to the Royal Dublin Society. During subsequent years he made many surveys and issued many reports on mineral districts in Ireland, and these formed the foundation of his first geological map of the country (1815). In 1832 Griffith became engineer of public works in Cork, Kerry and Limerick, and was occupied until 1830 in repairing old roads and in laying out many miles of new roads. Meanwhile in 1825 he was appointed to carry out the perambulation or boundary survey of Ireland, the object of which was to ascertain and mark the boundaries of every county, barony, parish and townland in preparation for the ordnance survey. This work was finished in 1834. He was also called upon to assist in preparing a bill for the general valuation of Ireland; the act was passed in 1836, and he was appointed commissioner of valuation, a post which he held until 1843.

On "Griffith's valuation" the various local and public assessments were made. His extensive investigations furnished him with ample material for improving his geological map, and the second edition was published in 1835. A third edition on a larger scale (1 in. to 4 m.) was issued under the Board of Ordnance in 1839, and it was further revised in 1855. For this great work and his other services to science he was awarded the Wollaston medal by the Geological Society in 1854. In 1850 he was made chairman of the Irish Board of Works, and in 1858 he was created a baronet. He died in Dublin on the 2nd of September 1878.

Among his many geological works the following may be mentioned: Outline of the Geology of Ireland (1838); Notice respecting the Fossils of the Mountain Limestone of Ireland, as compared with those of Great Britain, and also with the Devonian System (1842); A Synopsis of the Characters of the Carboniferous Limestone Fossils of Ireland (1844) (with F. McCoy); A Synopsis of the Silurian Fossils of Ireland (1846) (with F. McCoy). See Memoirs in Quart. Journ. Geol. Soc. xxxiv. 396–420. See also Mag. Nat. Hist. (new ser.) xxv. 1599–1626.

Grille, a French term for an enclosure in either iron or bronze; there is no equivalent in English, "grating" applying more to a horizontal frame of bars over a sunk area, and "grate" to the iron bars of an open fireplace. The finest examples of the grille are those known as the rejas, which in Spanish churches form the enclosures of the chapels, such as the reja in the Capilla Real at Granada in wrought iron partly gilt (1522). Similar grilles are employed to protect the ground-floor windows of mansions not only in Spain but in Italy and Germany. In England the most beautiful example is that in front of Queen Anne's lamp in Westminster Abbey. Among all the finest grilles in Italy are the enclosures of the tombs of the Della Scalas at Verona (end of 13th century), in Germany the grille of the cenotaph of Maximilian at Innsbruck (early 16th century) and in France those which enclose the Place Stanislaus, the Place de la Carrière and the churches of Nancy, which were wrought by Jean Lamour in the middle of the 18th century. Generally, however, throughout Germany the wrought iron grilles are fine examples of forging, and they are employed for the enclosures of the numerous fountains, in the tympana of gates and for that of the windows. At Danzig in the Marienkirche are some fine examples in brass.

Grillparzer, Franz (1771–1872), the greatest dramatic poet of Austria, was born in Vienna, on the 15th of January 1791. His father, severe, pedantic, a staunch upholder of the liberal traditions of the reign of Joseph II., was an advocate.
of some standing; his mother, a nervous, finely-strung woman, belonged to the well-known musical family of Sonnleithner. After a desultory education, Grillparzer entered in 1807 the university of Vienna as a student of jurisprudence; but two years later his father died, leaving the family in straitened circumstances, and Franz, the eldest son, was obliged to turn to private tutoring. In 1813 he received an appointment in the court library, but as this was unpaid, he accepted after some months a clerkship that offered more solid prospects, in the Lower Austrian revenue administration. Through the influence of Graf Stadion, the minister of finance, he was in 1816 the youngest poet to the Hofburgtheater, and promoted to the Hofbamer (exchequer); in 1832 he became director of the archives of that department, and in 1836 retired from the civil service with the title of Hofrat. Grillparzer had little capacity for an official career and regarded his office merely as a means of independence.

In 1817 the first representation of his tragedy Die Ahnfrau made him famous, but before this he had written a long tragedy in iambics, Blanca von Castiliuen (1807-1809), which was obviously modelled on Schiller's Don Carlos; and even more promising were the dramatic fragments Spartacus and Alfred der Große (1809). Die Ahnfrau is a gruesome "fate-tragedy" in the trochaic measure of the Spanish drama, already made popular by Adolf Müllner in his Schuld; but Grillparzer's work is a play of real poetic beauties, and reveals an instinct for dramatic as opposed to merely theatrical effect, which distinguishes it from other "fate-dramas" of the day. Unfortunately its success led to the poet's being classed for the best part of his life with playwrights like Müllner and Houwald. Die Ahnfrau was followed by Sappho (1818), a drama of a very different type; in the classic spirit of Goethe's Tasso, Grillparzer unraveled the tragedy of poetic genius, the renunciation of earthly happiness imposed upon the poet by his higher mission. In 1821 appeared Das goldene Vlies, a trilogy which had been interrupted in 1819 by the death of the poet's mother—in a fit of depression she had taken her own life—and a subsequent visit to Italy. Opening with a powerful dramatic prelude in one act, Der Gastfreund, Grillparzer depicts in Die Argonauten Jason's adventures in his quest for the Fleece; while Medea, a tragedy of noble classic proportions, contains the culminating events of the story which had been so often dramatized before. The theme is similar to that of Sappho, but the scale on which it is represented is larger; it is again the tragedy of the heart's desire, the conflict of the simple happy life with that sinister power—be it genius, or ambition—which upsets the equilibrium of life. The end is bitter disillusionment, the only consolation renunciation. Medea, her revenge stilled, her children dead, bears the fatal Fleece back to Delphi, while Jason is left to realize the nothingness of human striving and earthly happiness.

For his historical tragedy König Ottakars Glück und Ende (1823, but owing to difficulties with the censor, not performed until 1835), Grillparzer chose one of the most picturesque events in Austrian domestic history, the conflict of Ottokar of Bohemia with Rudolph von Habsburg. With an almost modern realism he reproduced the motley world of the old chronicles, at the same time not losing sight of the needs of the theatre; the fall of Ottokar is but another text from which the poet preached the futility of endeavour and the vanity of worldly greatness. A second historical tragedy, Ein treuer Diener seines Herrn (1826, performed 1828), attempts to embody a more heroic gospel; but the subject—the superhuman self-effacement of Lanhkhus, the former Gie of Meran—was too uncompromising an illustration of Kant's categorical imperative of duty to be palatable in the theatre. With these historical tragedies began the darkest ten years in the poet's life. They brought him into conflict with the Austrian censor—a conflict which grated on Grillparzer's sensitive soul, and was aggravated by his own position as a servant of the state; in 1826 he paid a visit to Goethe in Weimar, and was able to compare the lightened conditions which prevailed in the little Saxon duchy with the intellectual thralldom of Vienna. To these troubles were added more serious personal worries. In the winter of 1820-1821 he had met for the first time Katharina Fröhlich (1801-1879), and the acquaintance rapidly ripened into love on both sides; but whether owing to a presentiment of mutual incompatibility, or merely owing to Grillparzer's conviction that life had no happiness in store for him, he shrank from marriage. Whatever the cause may have been, the poet was plunged into an abyss of misery and despair to which his diary bears heart-rending witness; his sufferings found poetic expression in the fine cycle of poems bearing the significant title Tristia ex Ponto (1826).

Yet to these years we owe the completion of two of Grillparzer's greatest dramas, Des Meeres und der Liebe Wellen (1831) and Der Traum, ein Leben (1834). In the former tragedy, a dramatization of the story of Hero and Leander, he returned to the Hellenic world of Sappho, and produced what is perhaps the finest of all German love-tragedies. His mastery of dramatic technique is here combined with a ripeness of poetic expression and with an insight into motive which suggests the modern psychological drama of Hebbel and Ibsen; the old Greek love-story of Musaeus and the hero's alliance and constant love which the poet had borrowed from the great Spanish poets, Lope de Vega and Calderon. Der Traum, ein Leben, Grillparzer's technical masterpiece, is in form perhaps even more Spanish; it is also more of what Goethe called a "confession." The aspirations of Rustan, an ambitious young peasant, are shadowed forth in the hero's dream, which takes up nearly three acts of the play; ultimately Rustan awakens from his nightmare to realize the truth of Grillparzer's own pessimistic doctrine that all earthly ambitions and aspirations are vanity; the only happiness is found in constant union with one's "herzsieligen Frieden und die schuldheifere Brust." Der Traum, ein Leben was the first of Grillparzer's dramas which did not end tragically, and in 1838 he produced his only comedy, Weh' dem, der lügt. But Weh' dem, der lügt, in spite of its humour of situation, its sparkling dialogue and the originality of its idea—namely, that the hero gains his end by invariably telling the truth, where his enemies as invariably expect him to be lying—was too strange to meet with approval in its day. Its failure was a blow to the poet, who turned his back for ever on the German theatre. In 1836 Grillparzer paid a visit to Paris and London, in 1843 to Athens and Constantinople. Thus came the Revolution which struck off the intellectual fetters under which Grillparzer and his contemporaries had groaned in Austria, but the liberation came too late for him. Honours were heaped upon him; he was made a member of the Academy of Sciences; Heinrich Laube, as director of the Burgtheater, reinstated his plays on the repertory; he was in 1861 elected to the Austrian Herrenhaus; his eightieth birthday was a national festival, and when he died in Vienna, on the 21st of January 1848, the mourning of the Austrian people was universal. With the exception of a beautiful fragment, Esther (1861), Grillparzer published no more dramatic poetry after the fasce of Weh' dem, der lügt, but at his death three completed tragedies were found among his papers. Of these, Die Jüdin von Toledo, an admirable adaptation from the Spanish, has won a permanent place in the German classical repertory; Ein Bruderswist im Hause Habsburg is a powerful historical tragedy and Libussa is perhaps the ripest, as it is certainly the deepest, of all Grillparzer's dramas; the latter two plays prove how much was lost by the poet's divorce from the theatre.

Although Grillparzer was essentially a dramatist, his lyric poetry is in the intensity of its personal note hardly inferior to his verse; and the bitterness of his later years found vent in biting and stinging epigrams that spared few of his greater contemporaries. As a prose writer, he has left one powerful short story, Der arme Spielmann (1848), and a volume of critical studies on the Spanish drama, which shows how completely he had succeeded in identifying himself with the Spanish point of view.

Grillparzer's brooding, unbalanced temperament, his lack of will-power, his pessimistic renunciation and the bitterness which his self-imposed martyrdom produced in him, made him peculiarly adapted to express the mood of Austria in the epoch of intellectual
thrudom that lay between the Napoleonic wars and the Revolution of 1848; his poetry reflects exactly the spirit of his people under the Metternich régime, and there is a deep truth behind the description of Der Traum, ein Leben as the Austrian Faust. His fame was in accordance with the general tenor of his life; even in Austria a true understanding for his genius was late in coming, and not until the century of 1891 did the German-speaking world realize that it possessed in him a dramatic poet of the first rank; in other words, that Grillparzer was no mere "Epigone" of the classic period, but a poet who, by a rare assimilation of the strength of his race, freed the imaginative depth of classicalism and the delicacy and grace of the Spaniards, had opened up new paths for the higher dramatic poetry of Europe.

GRIMALD (or GRIMOLD), NICHOLAS (1519-1562). English poet, was born in Huntingdonshire, the son probably of Giovanni Baptista Grimoldi, who had been a clerk in the service of Empson and Dudley in the reign of Henry VII. He was educated at Christ's College, Cambridge, where he took his B.A. degree in 1540. He then removed to Oxford, becoming a probationer-fellow of Merton College in 1541. In 1547 he was lecturing on rhetoric at Christ Church, and shortly afterwards became chaplain to Bishop Ridley, who, when he was in prison, desired Grillparzer to translate Lauretius Vallis's book against the alleged Denation of Constantine, and the De gestis Basiliensis Concilii of Aeneas Sylvius (Pius II). His connexion with Ridley brought him under suspicion, and he was imprisoned in the Marshalsea. It is said that he escaped the penalties of heresy by recanting his errors, and was despatched accordingly by his Protestant contemporaries. Grimald contributed to the original edition (June 1557) of Songs and Sonettes (commonly known as Tottel's Miscellany), forty poems, only ten of which are retained in the second edition published in the next month. He translated (1553) Cicero's De officiis as Marcus Tudius Ciceroes thee bokes of duties (2nd ed., 1555); a Latin paraphrase of Virgil's Georgics (printed 1591) is attributed to him, but most of the works assigned to him by Bale are lost. Two Latin tragedies are extant: Archipræstæ sive Johannes Baptistæ, printed at Cologne in 1548, probably performed at Oxford the year before, and Christus redivivus (Cologne, 1543), edited by Prof. J. M. Hart (for the Modern Language Association of America, 1886, separately issued 1899). It cannot be determined whether Grimald was familiar with Buchanan's Baptises (1542), or with J. Schoeppe's Johannes decretalium et Edictorum (1545), for granted a purely romantic motive for the catastrophe in the passionate attachment of Herodias to Herod, and constantly resorts to lyrical methods. As a poet Grimald is memorable as the earliest follower of Surrey in the production of blank verse. He writes sometimes simply enough, as in the lines on his own childhood addressed to his mother, but in general his style is more artificial, and his metaphors more studied than is the case with the other contributors to the Miscellany. His classical reading shows itself in the comparative terseness and smartness of his verses. His epitaph was written by Barnabe Googe in May 1562. See C. H. Herford, Studies in the Literary Relations of England and Germany (pp. 113-119, 1886). A Catalogue of printed books . . . by writers bearing the name of Grimaldi (ed. A. B. Grimald), printed 1883; and Arber's reprint of Tottel's Miscellany.

GRIMALDI, GIOVANNI FRANCESCO (1606-1680), Italian architect and painter, named II Bolognese from the place of his birth, was a relative of the Caracci family, under whom it is presumed he studied first. He was afterwards a pupil of Albani. He went to Rome, and was appointed architect to Pope Paul V., and was also patronized by succeeding popes. Towards 1648 he was appointed to the service of Cardinal Mazarin, and for about two years was employed in buildings for that minister and for Louis XIV., and in fresco-painting in the Louvre. His colour was strong, somewhat excessive in the use of green; his touch light. He painted history, portraits and landscapes—the last with predilection, especially in his advanced years—and executed engravings and etchings from his own landscapes and from those of Titian and the Caracci. Returning to Rome, he was made president of the Academy of St Luke; and in that city he died on the 28th of November 1680, in high repute not only for his artistic skill but for his upright and charitable deeds. His son Alessandro assisted him both in painting and in engraving. Paintings by Grimaldi are preserved in the Quirinal and Vatican palaces, and in the church of S. Martino a' Monti; there is also a series of his landscapes in the Colonna Gallery.

GRIMALDI, JOSEPH (1779-1837), the most celebrated of English clowns, was born in London on the 18th of December 1779, the son of an Italian actor. When less than two years old he was brought upon the stage at Drury Lane; at the age of three he began to appear at Sadler's Wells; and he did not finally retire until 1828. As the clown of pantomime he was considered without an equal, his greatest success being in Mother Goose, at Covent Garden (1866 and often revived). Grimaldi died on the 31st of May 1837. His Memoirs in two volumes (1838) were edited by Charles Dickens.

GRIMKÉ, SARAH MOORE (1792-1873) and ANGELINA EMILY (1805-1879), American reformers, born in Charleston, South Carolina—Sarah on the 6th of November 1792, and Angelina on the 20th of February 1805—were daughters of John Facheareu Grünké (1752-1819), an artillery officer in the Continental army, a jurist of some distinction, a man of wealth and culture and a slave-holder. Their older brother, Thomas Smith Grünké (1786-1834), was born in Charleston; graduated at Yale in 1807; was a successful lawyer, and in 1826-1830 was a member of the state Senate, in which he, almost alone of the prominent lawyers of the state, opposed nullification; he strongly advocated spelling-reform, temperance and absolute non-resistance, and published Addresses on Science, Education and Literature (1831). His early intellectual influence on Sarah was strong.

In her thirteenth year Sarah was godmother to her sister Angelina. Sarah in 1821 revisited Philadelphia, whither she had accompanied her father on his last illness, and there, having been already dissatisfied with the Episcopal Church and with the Presbyterian, she became a Quaker; so, too, did Angelina, who joined her in 1829. Both sisters (Angelina first) soon grew into a belief in immediate abolition, strongly censured by many Quakers, who were even more shocked by a sympathetic letter dated "8th Month, 50th, 1835" written by Angelina to W. L. Garrison, followed in 1836 by her Appeal to the Christian Women of the South, and at the end of that year, by an Epistle to the Clergy of the Southern States, written by Sarah, who now thoroughly agreed with her younger sister. In the same year, at the invitation of Elizur Wright (1804-1888), corresponding secretary of the American Anti-Slavery Society, Angelina, accompanied by Sarah, began giving talks on slavery, first in private and then in public, so that in 1837, when they set to work in Massachusetts, they had to secure the use of large halls. Their speaking from public platforms resulted in a letter issued by some members of the General Association of Congregational Ministers of Massachusetts, calling on the clergy to close their.
churches to women electors; Garrison denounced the attack on the Grimmel sisters and Wittcher ridiculed it in his poem, "The Pastoral Letter." Angelina pointedly answered Miss Beecher on the Slave Question (1837) in letters in the Liberator. Sarah, who had never forgotten that her studies had been curtailed because she was a girl, contributed to the Boston Spectator papers on "The Province of Woman" and published Letters on the Condition of Women and the Equality of the Sexes (1838)—the real beginning of the "woman's rights" movement in America, and at the time a cause of anxiety to Wittcher and others, who urged upon the sisters the prior importance of the antislavery cause. In 1838 Angelina married the compostor of the Gypsy Wm. Weld (1803-1895), a reformer and abolition orator and pamphleteer, who had taken part in the famous Lane Seminary debates in 1834, had left the Seminary for the lecture platform when the anti-slavery society was broken up by the Lane trustees, but had lost his voice in 1836 and had become editor of the publications of the American Anti-Slavery Society. 2 They lived, with Sarah, at Fort Lee, New Jersey, in 1838-1840, then on a farm at Belleville, New Jersey, and then conducted a school for black and white alike at Eagleswood, near Perth Amboy, New Jersey. After moving to New York, and on from New York to Massachusettes, the three were employed in Dr Lewis's school. There Sarah died on the 23rd of December 1873, and Angelina on the 26th of October 1879. Both sisters indulged in various "fads"—Graham's diet, bloomer-wearing, absolute non-resistance. Angelina did no public speaking after her marriage, save at Pennsylvania Hall (Philadelphia), destroyed by a mob immediately after her address there; but besides her domestic and school duties she was full of tender charity. Sarah at the age of 62 was still eager to study law or medicine, or to do something to aid her sex; at 75 she translated and abridged Lamar-tine's life of Jean de Arc.

See Catherine H. Birney, The Grimmel Sisters (Boston, 1885).

It was probably in 1774 that Grimm was introduced by Rousseau to Madame d'Épinay, with whom he soon formed a liaison which led to an irrecconcilable rupture between him and Rousseau. Rousseau was induced by his resentment to give in his Confessions a wholly mendacious portrait of Grimm's character. In 1775, after the death of Count Friesen, who was a nephew of Marshal Saxe and an officer in the French army, Grimm became secrétaire des commandements to the Duke of Orleans, and in this capacity he accompanied Marshal d'Estrees on the campaign of Westphalia in 1756-57. He was named envoy of the town of Frankfort at the court of France in 1759, but was deprived of his office for expressing the opinion that the Duke of Burgundy is the right heir to the Crown, which was accepted by Louis XV. He was made a baron of the Holy Roman Empire in 1775. His introduction to Catherine II. of Russia took place at St Petersburg in 1773, where he was in the suite of Wilhelmine of Hesse-Darmstadt on the occasion of her marriage to the czarевич Paul. He became minister of Saxe-Gotha at the court of France in 1776, but in 1777 he again left Paris on a visit to St Petersburg, where he remained for nearly a year in daily intercourse with Catherine. He acted as Paris agent for the empress in the purchase of works of art, and executed many diplomatic missions for her. In 1782 and 1783 and the following years he lost his two most intimate friends, Diderot and Diderot. In 1792 he emigrated, and in the next year settled in Gotha, where his poverty was relieved by Catherine, who in 1796 appointed him minister of Russia at Hamburg. On the death of the empress Catherine he took refuge with Mme d'Épinay's granddaughter, Émilie de Belsunce, comtesse de Bueil. Grimm had always interested himself in her, and had procured her dowry from the empress Catherine. She now received him with the utmost kindness. He died at Gotha on the 19th of December 1807.

The correspondence of Grimm was strictly confidential, and was not divulged during his lifetime. It embraces nearly the whole period from 1750 to 1790, but the later volumes, 1773 to 1790, were chiefly the work of his secretary, Jakob Heinrich Meister. At first he contented himself with enumerating the chief current views in literature and art and indicating very slightly the contents of the principal new books, but gradually his criticisms became more extended and trenchant, and he touched on nearly every subject—political, literary, artistic, social and religious—which interested the Parisian society of the time. He is the great French critic of the age, and he exhibits the foibles and selfishness of the society in which he moved; but he was unbiased in his literary judgments, and his time has only served to confirm his criticisms. In style and manner of expression he is thoroughly French. He is generally somewhat cold in his appreciation, but his literary taste is delicate and subtle; and it was the opinion of Sainte-Beuve that the quality of his thought in his best moments will compare not unfavourably even with that of Voltaire. His religious and philosophical opinions were entirely negative.

Grimm's Correspondance littéraire, philosophique et critique... depuis 1753 jusqu'en 1790, was edited, with many excisions, by B. A. Sandeau and published at Paris in 1812, in 6 vols. 8vo; deuxième partie, de 1776 à 1782, in 1812 in 5 vols. 8vo; and troisième partie, pendant une partie des années 1775 et 1776, et pendant les années 1782 à 1790 inclusivement, in 1813 in 5 vols. 8vo. A supplementary volume appeared in 1814; the whole correspondance was collected and published by M. Jules Taschereau, with the assistance of A. Chaudé, in a Nouvelle Edition, revue et mise dans un meilleur ordre, avec de notes et des éclaircissements, et où se sont réunis reliables, in 4 vols. 8vo. A third edition is that of M. Tourneux (16 vols., 1877-1882). Grimm's Memoire historique sur l'origine et les suites de mon attachement pour l'imprimerie Catherine II jusqu'à deu dés sa majesté impériale, la correspondance avec Grimm (1774-1796) were published by J. Grot in 1880, in the Collection of the Russian Imperial Historical Society. She treats him very familiarly, and calls him "her dear Grimm." At the hotel, he begged her to destroy her letters, but he refused, and after his death they were returned to St Petersburg. Grimm's side of the correspondence, however, is only partially preserved. He signs himself
GRIMM, J. L. C.

"Pleuror." Some of Grimm's letters, besides the official correspondence, are included in the edition of M. Tournoux; others are contained in the Erinnerungen einer Urgroßmutter of K. von Bechtolsheim, edited (Berlin, 1902) by Count C. Oberndorff. See also Mme d'Arblay's (1816) and Dr. C. Ernst's (1868) memoirs. The second edition of the celebrated folio, which was published at Marburg in 1816 (second ed., 1818), was enlarged by the addition of 1800 pages of notes (first ed., 1785). Grimm's Mekhior (1785-1863), with whom he was often at variance, was appointed superintendent of the Academy of Berlin (1828) and later, in 1851, was appointed professor of philology at the University of Leipzig (1852). He was a man of letters, a scholar, and a statesman, and his influence was widely felt.

Grimm, Jacob Ludwig Carl (1785-1863), German philologist and mythologist, was born on the 4th of January 1785 at Hanau, in Hesse-Cassel. His father, who was a lawyer, died while he was a child, and the mother was left with very small means; but her sister, who was lady of the chamber to the landgrave of Hesse, helped to support and educate her numerous family. Jacob, with his younger brother Wilhelm (born on the 24th of February 1786), was sent in 1798 to the public school at Cassel. In 1802 he proceeded to the university of Marburg, where he studied law, a profession for which he had been destined by his father. His brother joined him at Marburg a year later, having just recovered from a long and severe illness, and likewise began the study of law. Up to this time Jacob Grimm had been actuated only by a general thirst for knowledge and his energies had not found any aim beyond the practical one of making himself a position in life. The first definite impulse came from the lectures of Savigny, the celebrated investigator of Roman law, who, as Grimm himself says (in the preface to the Deutsche Grammatik), first taught him to realize what it meant to study any science. Savigny's lectures also awakened in him that love for historical and antiquarian investigation which forms the basis of all his work. Then followed personal acquaintance, and it was in Savigny's well-provided library that Grimm first turned over the leaves of Bodmer's edition of the Old German minnesingers and other early texts, and felt an eager desire to penetrate further into the obscurities and half-revealed mysteries of their language. In the beginning of 1805 he received an invitation from Savigny, who had removed to Paris, to help him in his literary work. Grimm passed a very happy time in Paris, strengthening his taste for the literatures of the middle ages by his studies in the Paris libraries. Towards the close of the year he returned to Cassel, where his mother and Wilhelm had settled, the latter having finished his studies. The next year he obtained a situation in the war office with the very small salary of 100 thalers. One of his grievances was that he had to exchange his stylish Paris suit for a stiff uniform and pigtail. But he had full leisure for the prosecution of his studies. In 1808, soon after the death of his mother, he was appointed superintendent of the private library of Jerome Buonaparte, king of Westphalia, into which Hesse-Cassel had been incorporated by Napoleon. Jerome appointed him an auditor to the state council, while he retained his other post. His salary was increased in a short interval from 2000 to 4000 francs, and his official duties were hardly more than nominal. After the expulsion of Jerome and the reinstatement of an elector, Grimm was appointed in 1813 secretary of legation, to accompany the Hessian minister to the headquarters of the allied army. In 1814 he was sent to Paris to demand restitution of the books carried off by the French, and in 1814-1815 he attended the congress of Vienna as secretary of legation. On his return he was again sent to Paris on the same errand as before. Meanwhile Wilhelm had received an appointment in the Cassel library, and in 1816 Jacob was made second librarian under Völkel. On the death of Völkel in 1828 the brothers expected to be advanced to the first and second librarianships, respectively, and were much dissatisfied when the first place was given to Rommel, keeper of the archives. So they removed next year to Göttingen, where Jacob received the appointment of professor and librarian, Wilhelm that of under-librarian. Jacob Grimm lectured on legal antiquities, historical grammar, literary history, and dialectics, expounding Old German poems, and commented on the German and Roman Tacitus. At this period he discovered his love for philology and lively in figure, with a harsh voice, speaking a broad Hessian dialect. His powerful memory enabled him to dispense with the manuscript which most German professors rely on, and he spoke extempore, referring only occasionally to a few names and dates written on a slip of paper. He himself regretted that he had begun the work of teaching so late in life; and as a lecturer he was not successful: he had no idea of digesting his facts and teaching them to the comprehension of his hearers; and even the brilliant, terse and eloquent passages which abound in his writings lost much of their effect when jerked out in the midst of a long array of dry facts. In 1837, being one of the seven professors who signed a protest against the king of Hanover's abrogation of the constitution established some years before, he was dismissed from his professorship, and banished from the kingdom of Hanover. He returned to Cassel together with his brother, who had also signed the protest, and remained there till, in 1840, they accepted an invitation from the king of Prussia to remove to Berlin, where they both received professorships, and were elected members of the Academy of Sciences. Not being under any obligation to lecture, Jacob seldom did so, but together with his brother worked at the great dictionary. During their stay at Cassel Jacob regularly attended the meetings of the academy, where he read papers on the most varied subjects. The best known of these are those on Lachmann, Schiller, and his brother Wilhelm (who died in 1859), on old age, and on the origin of language. He also described his impressions of Italian and Scandinavian travel, interspersing his more general observations with linguistic details, as is the case in all his works. Grimm died in 1863, working up to the last. He was never ill, and worked on all day, without haste and without pause. He was not at all impatient of interruption, but seemed rather to be refreshed by it, returning to his work without effort. He wrote for the press with great rapidity, and hardly ever made corrections. He never revised what he had written, remarking with a certain wonder of his brother, "Wilhelm reads his manuscripts over again before sending them to press!" His temperament was uniformly cheerful, and he was easily amused. Outside his own special work he had a marked taste for botany. The spirit which animated his work is best described by himself at the end of his autobiography. "Nearly all my labours have been devoted, either directly or indirectly, to the investigation of our earlier language, poetry and laws. These studies may have appeared to many, and may still appear, useless; to me they have always seemed a noble and earnest task, definitely and inseparably connected with our common fatherland, and calculated to foster the love of it. My principle has always been in these investigations to under-value nothing, but to utilize the small for the illustration of the great, the popular tradition for the elucidation of the written monuments." The purely scientific side of Grimm's character developed slowly. He seems to have felt the want of definite principles of etymology without being able to discover them, and indeed even in the first edition of his grammar (1819) he seems to be often groping in the dark. As early as 1815 we find A. W. Schlegel reviewing the Altdutsche Wilder (a periodical published by the two brothers) very severely, condemning the lawless etymological combinations it contained, and insisting on the necessity of strict philological method and a fundamental investigation of the laws of language, especially in the correspondence of sounds. This criticism is said to have had a considerable influence on the direction of Grimm's studies. The first work he published, Über den altdutschen Meistersang (1811), was of a purely literary character. Yet even in this essay Grimm showed that Minnesang and Meistersang were really one form of poetry, of which they merely represented different stages of development, and also announced his important discovery of the unvariable division of the Lied into three strophic parts. His text-editions were mostly prepared in common with his brother. In 1812 they published the two ancient fragments of the Hildebrandslied and the Weissenbrunner Gebet, Jacob having recovered the two old manuscripts, and changed the alliteration in these poems. However, Jacob had little taste for text-editing, and, as he himself confessed, the evolving of a
to include all the languages in his grammar; but he soon found that Old High German postulated Gothic, that the later stages of German could not be understood without the help of the Low German dialects, including English, and that the rich literature of Scandinavia could as little be ignored. The first edition of the second part of the Odder, which appeared in 1819, and is now extremely rare, treated of the inflections of all these languages, together with a general introduction, in which he vindicated the importance of an historical study of the German language against the a priori, quasi-philosophical methods then in vogue.

In 1822 this volume appeared in a second edition—really a new work, for, as Grimm himself says in the preface, it cost him little reflection to mow down the first crop to the ground. The wide distance between the two stages of Grimm's development in these two editions is significantly shown by the fact that while the first edition gives only the inflections, in the second volume phonology takes up no fewer than 600 pages, more than half of the whole volume. Grimm had, at last, awakened to the full conviction that all sound philology must be based on rigorous adhesion to the laws of sound-change, and he never afterwards swerved from this principle, which gave to all his investigations, even in their boldest flights, that iron-bound consistency, and that force of conviction which distinguish science from dilettantism; up to Grimm's time philology was nothing but a more or less laborious and conscientious dilettantism, with occasional flashes of scientific inspiration; he made it into a science. His advances must be due to the influence of the contemporary Rask. Rask was born two years later than Grimm, but his remarkable precocity gave him somewhat the start. Even in Grimm's first editions his Icelandic paradigms are based entirely on Rask's grammar, and in his second edition he relied almost entirely on Rask for Old English. His debt to Rask can only be estimated at its true value by comparing his treatment of Old English in the two editions; the difference is very great. Thus in the first edition he declines dea, dagis, plural dagas, not having observed the law of sound-change pointed out by Rask. There can be little doubt that the appearance of Rask's Old English grammar was a main inducement for him to recast his work from the beginning. To Rask also belongs the merit of having first distinctly formulated the laws of sound-correspondence in the different languages, especially in the vowels, those more fleeting elements of speech which had hitherto been ignored by etymologists.

This leads to a question which has been the subject of much controversy.—Who discovered what is known as Grimm's law? This law of the correspondence of consonants in the older Indo-European languages respectively is only first fully stated by Grimm in the second edition of the first part of his grammar. The correspondence of single consonants had been more or less clearly recognized by several of his predecessors; but the one who came nearest to the discovery of the complete law was the Swede J. Ihre, who established a considerable number of "literarum permutationes," such as b for f, with the examples bara = fare, befarar = fiber. Rask, in his essay on the origin of the Icelandic language, gives the same comparisons, with a few additions and corrections, and even the very point of the principle. As Grimm gives in the preface to his first edition expressly mentions this essay of Rask, there is every probability that it gave the first impulse to his own investigations. But there is a wide difference between the isolated permutations of his predecessors and the comprehensive generalizations under which he himself ranged them. The extension of the law to High German is also entirely his own. The only fact that can be adduced in support of the assertion that Grimm wished to deprive Rask of his claims to priority is that he does not expressly mention Rask's results in his second edition. But this is part of the plan of his work, viz., to refrain from all controversy or reference to the works of others. In his first edition he expressly calls attention to Rask's essay, and praises it most ungrudgingly. Rask himself refers as little to Ihre, merely alluding in a general way to Ihre's permutations, although his own debt to Ihre is infinitely greater than that of Grimm to...
Rask or any one else. It is true that a certain bitterness of feeling afterwards sprang up between Grimm and Rask, but this was the fault of the latter, who, impatient of contradiction and irritable in controversy, refused to acknowledge the value of Grimm's views when they involved modification of his own. The importance of Grimm's generalisation in the field of philology cannot be overestimated, and even the mystic completeness and symmetry of its formulation, although it has proved a big step to the correct explanation of the causes of the changes, was well calculated to strike the popular mind, and give it a vivid idea of the paramount importance of law, and the necessity of disregarding mere superficial resemblance. The most lawless etymologist bows down to the authority of Grimm's law, even if he honours it almost as much in the breach as in the observance.

The grammar was continued in three volumes, treating principally of derivation, composition and syntax, which last was left unfinished. Grimm then began a third edition, of which only one part, comprising the vowels, appeared in 1840, his time being afterwards taken up mainly by the dictionary. The grammar stands alone in the annals of science for comprehensiveness, method and fullness of detail. Every law, every letter, every syllable of inflection in the different languages is illustrated by an almost exhaustive mass of material. It has served as a model for all succeeding investigators. Diez's grammar of the Romance languages is founded entirely on its methods, and have also exerted a profound influence on the wider study of the Indo-European changes in general.

In the great German dictionary Grimm undertook a task for which he was hardly suited. His exclusively historical tendencies made it impossible for him to do justice to the individuality of a living language; and the disconnected statement of the facts of language in an ordinary alphabetical dictionary fatally mars its scientific character. It was also undertaken on so large a scale as to make it impossible for him and his brother to complete it themselves. The dictionary, as far as it was worked out by Grimm himself, may be described as a collection of disconnected antiquarian essays of high value.

Grimm's scientific character is notable for its combination of breadth and unity. He was as far removed from the narrowness of the specialist who has no ideas, no sympathies beyond some one author, period or corner of science, as from the shallow dabbler who feverishly attempts to master the details of half-a-dozen discordant pursuits. Even within his own special studies there is the same wise concentration; no Mezzofanti-like parrot display of useless polyglottism. The very foundations of his nature were harmonious; his passion and love of historical investigation received their fullest satisfaction in the study of the language, traditions, mythology, laws and literature of his own countrymen and their nearest kindred. But from this centre his investigations were pursued in every direction as far as his unerring instinct of healthy limitation would allow. He was equally fortunate in the harmony that subsisted between his intellectual and moral nature. He made cheerful the heavy sacrifices that science demands from its disciples, without feeling any of that envy and bitterness which often torment weaker natures; and although he lived and died with his fellow men, he was surrounded by a circle of human sympathies, and no man has ever exercised a profounder influence on the destinies of mankind. His was the very ideal of the noblest type of German character.

The following is a complete list of his separately published works, those which he published in common with his brother being marked with a star. For a list of his essays in periodicals, &c., see vol. v. of his Kleine ErzaHScHriften, from which the present list is taken. His life is briefly sketched in "Selbstbiographie," in vol. i. of the Kleine ErzaHScHriften. There is also a brief memoir by K. Codeke in Göttinger Professorst (Gotth. Perthes, 1872): Uber den alterdeutschen Meistergesang (Göttingen, 1811); *Kinder- und Hausmärchen (Berlin, 1812-1815) (many editions); *Das Lied von Hildebrand und das Weissenbrunner Gebet (Cassel, 1812); Althochdeutsche Würde (Cassel, Frankfort, 1813-1816, 3 vols.); *Der arme Heinrich von Harnimt von der Edda (Berlin, 1815); *Jemand vom hohen und irremstulde (Vienna, 1815); *Die Lieder der alten Edda (Berlin, 1815), Silve de romances vieja (Vienna, 1815); *Deutsche Sagen (Berlin, 1816-1818, 2 ed.,

GRIMMA, W. C.—GRIMMA

Berlin, 1865-1866); Deutsche Grammatik (Göttingen, 1819, 2nd ed., Göttingen, 1822-1840) (reprinted 1870 by W. Scherer, Berlin); Wuk Stephanosits's kleine srbische Grammatik, verdeutsch mit einer Vorrede (Leipzig and Berlin, 1824): Zur Rezension der Grammatik altslawischer Sprachen aus dem slavischen Ursprungs (Leipzig, 1826); Deutsche Rechtsaltertämer (Göttingen, 1828, 2nd ed., 1854); Hymnorum veteris ecclesiast XXVI. interpretatio theologica (Göttingen, 1830); Reinhart Fuchs (Berlin, 1834); Deutsche Mythologie (Gottingen, 1836); Das voll. (C. W. D. Mezzofanti).—Grimma, W. C., was a man of great industry. He was a member of the Philosophical Society of Berlin, of the Academy of Sciences of Vienna, and of the Royal Society of Sciences at Göttingen. He was a student of history, literature, and art, and a profound scholar in all the sciences of his time.
nunnery from which Catherine von Bora fled in 1523, and the village of Düben, with an old castle. Grimm is of Sorbian origin, and is first mentioned in 1265. It passed then into possession of Saxony and has remained since part of that country.

GRIMMELSHAUSEN, HANS JAKOB CHRISTOPFEL VON (1652–1676), German author, was born at Gehlenhausen in or about 1652. At the age of ten he was kidnapped by Hessian soldiers, and in their midst tasted the adventures of life in the Thirty Years' War. At its close, Grimmelhausen entered the service of Franz Egon von Fürstenberg, bishop of Strasburg and in 1665 was made Schultheiss (magistrate) at Rhenchen in Baden. On obtaining this appointment, he devoted himself to literary pursuits, and in 1669 published *Der abenteuerliche Simplicissimus, Teutsch, d. h. die Beschreibung des Lebens eines solsamen Vaganten, genannt Melchior Surnfels von Fucksheim*, the greatest German novel of the 17th century. For this work he took as his model the picturesque romances of Spain, already to some extent known in Germany. *Simplicissimus* is in great measure its author's autobiography; he begins with the childhood of his hero, and describes the latter's adventures amid the stirring scenes of the Thirty Years' War. The realistic detail with which these pictures are presented makes the book one of the most valuable documents of its time. In the later parts Grimmelhausen, however, over-indulges in allegory, and finally loses himself in a Robinson Crusoe story. Among his other works the most important are the so-called *Simpliciosishe Schriften*: *Die Erzbetrügerin und Landstörerin Courasche* (c. 1669); *Der solsame Springinsfeld* (1670) and *Das wunderbare Vogelnest* (1672). His satires, such as *Deutse Micheil* (1670), and "gallant" novels, like *Dietwuld und Amelinde* (1676) are of inferior interest. He died at Rhenchen on the 17th of August 1676, where a monument was erected to him in 1879.

Editions of *Simplicissimus* and the *Simpliciosishe Schriften* have been published by A. von Keller (1854), H. Kurz (1865–1864), J. Tittmann (1877) and F. Bobertag (1882). A reprint of the first edition of the novel was edited by R. Kögel for the series of *Neudrucke des 18. Jahrhunderts* (1880), in which it was introduced in modern editions; also F. Antoine, *Étude sur le Simplicissimus de Grimmel-hausen* (1882) and E. Schmidt in his *Charakteristik*, vol. i (1886).

GRIMOARD, PHILIPPE HENRI, COMTE DE (1753–1815), French soldier and military writer, entered the royal army at the age of sixteen, and in 1775 published his *Essai théorique et pratique sur les batailles*. Shortly afterwards Louis XVI. placed him in his own military cabinet and employed him especially in connexion with schemes of army reform. By the year of the Revolution he had become one of Louis's most valued counsellors, in political as well as military matters, and was marked out, though only a colonel, as the next Minister of War. In 1791 Grimoard was entrusted with the preparation of the scheme of defence for France, which proved two years later of great assistance to the Committee of Public Safety. The events of 1792 put an end to his military career, and the remainder of his life was spent in writing military books.

GRIMSBY, OF GREAT GRIMSBY, a municipal, county and parliamentary borough of Lincolnshire, England; an important seaport near the mouth of the Humber on the south shore. Pop. (1901) 63,138. It is 155 m. N. by E. from London by the Great Northern railway, and is also served by the Great Central railway. The church of St James, situated in the older part of the town, is a cruciform Early English building, retaining, in spite of injudicious restoration, many beautiful details. The chief buildings are those containing the town hall and the grammar school (a foundation of 1547), the exchange, a theatre, and the customs house and dock offices. A sailors' and fishermen's Harbour of Refuge, free library, consolational club and technical school are maintained. The duke of York public gardens were opened in 1894. Adjacent to Grimsby on the east is the coastal watering-place of Cleethorpes.

The dock railway station lies a mile from the town station. In 1849 the Great Central (then the Manchester, Sheffield and Lincolnshire) railway initiated a scheme of reclamation and dock-construction. This was completed in 1854, and subsequent extensions were made. There are two large fish-docks, and, for general traffic, the Royal dock, communicating with the Humber through a tidal basin, the small Union dock, and the extensive Alexandra dock, together with graving docks, timber yards, a patent slip, &c. These docks have an area of about 104 acres, but were found insufficient for the growing traffic of the port, and in 1906 the construction of a large new dock, of about 40 acres' area and 30 to 35 ft. depth, was undertaken by the Great Central Company at Immingham, 5 m. above Grimsby on the Humber. The principal imports are butter, woolens, timmer, cereals, eggs, glass, cottons, preserved meat, wool, sugar and bacon. The exports consist chiefly of woollen yarn, woolens, woolen goods, cotton yarn, machinery, &c. and coal. It is as a fishing port, however, that Grimsby is chiefly famous. Two of the docks are for the accommodation of the fishing fleet, which, consisting principally of steam trawlers, numbers upwards of 500 vessels. Regular passenger steamer runs from Grimsby to Dutch and south Swedish ports, and to Esbjerg (Denmark), chiefly those of the Wilson line and the Great Central railway. The chief industries of Grimsby are shipbuilding, brewing, tanning, manufactures of ship tackle, ropes, ice for preserving fish, turnery, flour, linseed cake, artificial manure; and there are saw mills, bone and corn mills, and cressote works. The municipal borough is under a mayor, 12 aldermen and 56 councillors. Area, 2852 acres.

Grimsby (Grimsby) is supposed to have been the landing-place of the Danes on their first invasion of Britain towards the close of the 8th century. It was a borough by prescription as early as 1201, in which year King John granted the burgesses a charter of liberties according to the custom of the burgesses of Northampton and of Henry III. in 1229 granted to the mayor and burgesses of Grimsby" the right of keeping the town for a yearly rent of £111, and confirmed the same in 1271. These charters were confirmed by later sovereigns. A governing charter, under the title of mayor and burgesses, was given by James II. in 1688, and under this the appointment of officers and other of the corporation, arrangements are to a great extent regulated. In 1201 King John granted the burgesses an annual fair for fifteen days, beginning on the 25th of May. Two annual fairs are now held, namely on the first Monday in April and the second Monday in October. No early grant of a market can be found, but in 1792 the market-day was Wednesday. In 1888 it had ceased to exist. Grimsby returned two members to the parliament of 1796, but in 1833 the number was reduced to one.

In the time of Edward III. Grimsby was an important seaport, but the haven became obstructed by sand and mud deposited by the Humber, and so the access of large vessels was prevented. At the beginning of the 14th century a subscription was raised by the proprietors of land in the neighbourhood for improving the harbour, and an act was obtained by which they were incorporated under the title "The Grimsby Haven Co." The fishing trade had become so important by 1800 that it was necessary to construct a new dock.

GRIMSTON, SIR HARBOTTLE (1663–1685), English politician, second son of Sir Harbottle Grimston, Bart. (d. 1648), was born
GRIMTHORPE, BARRISTER WAS AN
He for his 1548-1549.
the 1510-1583),
1700.
the parliament.
Laud with great vigour; was a member of the important committees of the parliament, including the one appointed in consequence of the attempted seizure of the five members; and became deputy- Lieutenant of Essex after the passing of the militia ordinance in January 1642. He disliked taking up arms against the king, but monitored the proceedings of the House of Commons during the Civil War. In the words of Clarendon, he "continued rather than concurred with them." Grimston does not appear to have taken the Solemn League and Covenant, but after the conclusion of the first period of the war he again became more active. He was president of the committee which investigated the escape of the king from Hampton Court in 1647, and was one of those who negotiated with Charles at Newport in 1648, when, according to Burnet, he fell upon his knees and urged the king to come to terms. From this time Grimston's sympathies shifted from the Royalist to the Parliamentary side, and he took an active part in the Commons when the assembly was "purged" by Colonel Pride, he was imprisoned; but was released after promising to do nothing detrimental to the parliament or the army, and spent the next few years in retirement. Before this time, his elder brother having already died, he had succeeded his father as 2nd baronet. In 1656 Sir Harbottle was returned to Cromwell's second parliament as member for Essex; but he was not allowed to take his seat; and with 97 others who were similarly treated he issued a remonstrance to the public. He was among the excluded members who re-entered the Long Parliament in February 1660, was then a member of the council of state, and was chosen Speaker of the House of Commons in the Convention Parliament of 1660. As Speaker he visited Charles II. at Breda, and addressed him in very flattering terms on his return to London; but he refused to accede to the king's demand that he should dismiss Burnet from his position as chaplain to the Master of the Rolls, and in parliament he strongly denounced any relaxation of the laws against papists. Grimston did not retain the office of Speaker after the dissolution of the Convention Parliament, but he was a member of the committee which tripped the remedies, and in November 1660 he was appointed Master of the Rolls. Report says he paid Clarendon £800 for the office, while Burnet declares he obtained it "without any application of his own." He died on the 2nd of January 1685. His friend and chaplain, Burnet, speaks very highly of his piety and impartiality, while not omitting the undoubted fact that he was "much sharpened against popery." He translated the law reports of his father-in-law, the judge, Sir George Croke (1560-1642), which were written in Norman-French, and five editions of this work have appeared. Seven of his parliamentary speeches were published, and he also wrote Strena Christiana (London, 1644, and other editions). Grimston's first wife, Croke's daughter Mary, bore him six sons and two daughters; and by his second wife, Anne, daughter and heiress of Sir Nathaniel Bacon, K.B., a grandson of Sir Nicholas Bacon, he had one daughter.

Of his sons one only, Samuel (1643-1700), survived his father, and when he died in October 1700 the baronetcy became extinct. Sir Harbottle's eldest daughter, Mary, married Sir Capel Lucy, Bart., and their grandson, William Lucy, succeeded to the estates. Sir Charles, grandson of Sir Charles, took the name of Grimston in 1700. This William Lucy Grimston (1683-1750) was created Baron Dunboyne and Viscount Grimston in the peerage of Ireland in 1710. He was succeeded as 2nd viscount by his son James (1711-1773), whose son James Bucknall (1747-1808) was made an English peer as Baron Verulam of Gorhambury in 1790. Then in 1813 his son James Walter (1775-1842), 2nd baron Verulam, was created earl of Verulam, and the present peer is his direct descendant. Sir Harbottle Grimston bought Sir Nicholas Bacon's estate at Gorhambury, which is still the residence of his descendants.

GRIMTHORPE, EDMUND BECKETT, 1ST BARON (1816-1905), son of Sir Edmund Beckett Denison, was born on the 12th of May 1816. He was educated at Doncaster and Eton, whence he proceeded to Trinity College, Cambridge, and graduated thirtieth wrangler in 1838. He was called to the bar at Lincoln's Inn in 1841. Upon succeeding to the baronetcy in 1874 he dropped the name of Denison, which his father had assumed in 1816. From 1877 to 1900 he was chancellor and vice-general of York, and he was raised to the peerage in 1886. He was made a Q.C. in 1854, and was for many years a leader of the Parliamentary Bar. He devoted himself to the study of astronomy, horology and architecture, more especially Gothic ecclesiastical architecture.

As early as 1850 he had become a recognized authority on clocks, watches and bells, and in particular on the construction of turret clocks, for he had designed Dent's Great Exhibition clock, and his Rudimentary Treatise has gone through many editions. In 1851 he was called upon, in conjunction with the astronomer royal (Mr. afterwards Sir, G. Airy) and Mr. Dent, the professional world to accept the...
GRINDELWALD—GRINGOIRE

on Mary's accession and made his way to Strassburg. Thence, like so many of the Marian exiles, he proceeded to Frankfurt, where he endeavoured to compose the disputes between the "Coxians" (see Cox, Richard), who regarded the 1552 Prayer Book as the perfection of reform, and the Knoxians, who wanted further simplification. He returned to England in January 1559, was appointed one of the committee to revise the liturgy, and one of the Protestant representatives at the Westminster conference. In July he was also elected Master of Pembroke Hall in succession to the recusant Dr Thomas Young (1543–1580) and Bishop of London in succession to Bonner.

Grindal himself was, however, inclined to be recalcitrant from different motives. He had qualms about vestments and other traces of "popery" as well as about the Erastianism of Elizabeth's ecclesiastical government. His Protestantism was robust enough; he did not mind recommending that a priest "might be put to some torment" (Hatfield MSS. i. 269), and in October 1562 he wrote to Cecil begging to know "if that second Julian, the king of Navarre, is killed; as he intended to preach at St Paul's Cross, and might take occasion to mention God's judgments on him" (Domestic Cal., 1547–1580, p. 200). But he was loth to execute judgments upon English Puritans, and modern high churchmen complain of his infirmity of purpose, his opportunism and his failure to give Parker adequate assistance in rebuilding the shattered fabric of the English Church. Grindal lacked that firm faith in the supreme importance of uniformity and autocracy which enabled Whitgift to persevere with a clear conscience nonconformists whose theology was indistinguishable from his own. As W. E. H. Lecky said, his climate was "too high to accommodate" the rigour which he repudiated hardly brought power or strength to the Church when practised by his successors, and London, which was always a difficult see, involved Bishop Sandys in similar troubles when Grindal had gone to York. As it was, although Parker said that Grindal "was not resolute and severe enough for the government of London," his attempts to enforce the use of the surplice evoked angry protests, especially in 1565, when considerable numbers of the nonconformists were suspended; and Grindal of his own motion denounced Cartwright to the Council in 1570. Other anxieties were brought upon him by the burning of his cathedral in 1561, for although Grindal himself is said to have contributed £100 towards its rebuilding, the clergy of his diocese were niggardly with their subscriptions and even his clergy were not liberal.

In 1570 Grindal was translated to the archbishopric of York, where Puritans were few and coercion would be required mainly for Roman Catholics. His first letter from Cawood to Cecil told that he had not been well received, that the gentry were not "well affected to godly religion and among the common people many superstitious practices remained." It is admitted by his Angled friend that the work of his episcopate against the Roman Catholics with good-will and considerable tact. He must have given general satisfaction, for even before Parker's death two persons so different as Burghley and Dean Nowell independently recommended Grindal's appointment as his successor, and Spenser speaks warmly of him in the Shepherd's Calendar as the "gentle shepherd Alfring." Burghley wished to conciliate the moderate Puritans and advised Grindal to mitigate the severity which had characterized Parker's treatment of the nonconformists. Grindal indeed attempted a reform of the ecclesiastical courts, but his political shrewdness brought him into conflict with the arbitrary temper of the queen. Elizabeth required Grindal to suppress the "prophecysings" or meetings for discussion which had come into vogue among the Puritan clergy, and she even wanted him to discourage preaching; she would have no doctrine that was not inspired by her authority. Grindal remonstrated, claiming some voice for the Church, and in June 1577 was suspended from his jurisdiction, though not his spiritual, functions for disobedience. He stood firm, and in January 1578 Secretary Wilson informed Burghley that the queen wished to have the archbishop deprived. She was dissuaded from this extreme course, but Grindal's sequestration was continued in spite of a petition from Convocation in 1581 for his reinstatement. Elizabeth then suggested that he should resign; this he declined to do, and after making an apology to the queen he was reinstated towards the end of 1582. But his infirmities were increasing, and while making preparations for his resignation, he died on the 6th of July 1583 and was buried in Croydon parish church. He left considerable benefactions to Pembroke Hall, Cambridge, Queen's College, Oxford, and Hart Hall, Cambridge; he also endowed a free school at St Bees, and also provided for the poor of St Bees, Canterbury, Lambeth and Croydon.

Strype's Life of Grindal is the principal authority; see also Dict. Nat. Biog., and, besides the authorities there cited, Gough's General Index to Parker Soc. Publ.; Acts of the Privy Council; Cal. of Hatfield MSS.; Dear's Life of the Church of England; Dodsley's volume in Stephens' and Hunt's series; Cambridge Mod. Hist. vol. iii.; Gee's Elizabethan Clergy; Birt's Elizabethan Religious Settlement; and Pierce's Introduction to the Martyrdom Tracts (1905).

GRINDELWALD, a valley in the Bernese Oberland, and one of the chief resorts of tourists in Switzerland. It is shut in on the south by the precipices of the Wetterhorn, Mettenberg and Eiger, between which two famous glaciers flow down. On the north it is sheltered by the Faulhorn range, while on the east the Great Scheidegg Pass leads over to Meiringen; and on the south-west the Little Scheidegg or Wengern Alp (railway line) lies a little below Churfirsten. The main village is connected with Interlaken by a rack railway (15 1/4 mi.). The valley is very green, and possesses excellent pastures, as well as fruit trees, though little corn is grown. It is watered by the Black Lütchine, a tributary of the Aar. The height of the parish church above the sea-level is 3458 ft. The population in 1900 was 3346, practically all Protestant and German-speaking, and living in 558 houses. The glacier guides are among the best in the Alps. The valley was originally inhabited by the serfs of various great lords in summer for the sake of pasturage. A chapel in a cave was superseded about 1146 by a wooden church, which in 1274 was, with the rest of the valley, granted by the Maltese monastery of Muri to the monastery of Vispers (now Korbi). The church was removed to the present site in 1793 to erect the present building. Gradually the Austin canons of Interlaken bought out all the other owners in the valley, but when that house was suppressed in 1528 by the town of Bern the inhabitants gained their freedom. The houses near the hotel Adler bear the name of Gydisdorf, but there is no village of Grindelwald properly speaking, though that name is usually given to the assemblage of hotels and shops between Gydisdorf and the railway station. Grindelwald is now very much frequented by visitors in winter.

See W. A. B. Coolidge, Walks and Excursions in the Valley of Grindelwald (also in French and German) (Grindelwald, 1900); Emmanuel Friedli, Bürnditsch als Spiegel bernischen Volksstums, Grindelwald, 1904; W. E. H. Lecky, The Heimatbunde des Kantons Bern, deutschen Teils, vol. i. (Bern, 1879), pp. 24–26; G. Strasser, Der Gletschermann (Grindelwald, 1888–1890). Scattered notices may be found in the edition (London, 1899) of the "General Introduction " (entitled "Hints and Notes of Travellers in the Alps") to John Ball's Alpine Guide. (W. A. B. C.)

GRINGOIRE (or GRINGORE), PIERRE (c. 1480–1530), French poet and dramatist, was born about the year 1480, probably at Caen. In his first work, Le Château de labour (1499), a didactic poem in praise of diligence, he narrates the troubles following on marriage. A young couple are visited by Care, Need, Discomfort, &c.; and other personages common to medieval allegories take part in the action. In November 1501 Gringoire was in Paris directing the production of a mystery play in honour of the archduke Philip of Austria, and in subsequent years he received many similar commissions. The fraternity of the Enfans sans Souci advanced him to the dignity of Mère Sotte and afterwards to the highest honour of the gild, that of Prince des Sots. For twenty years Gringoire seems to have been at the head of this illustrious confrérie. As Prince des Sots he exercised an extraordinary influence. At no time was the stage, rude and coarse as it was, more popular as a true exponent of the popular mind. Gringoire's success lay in the fact that he followed, but did not attempt to lead; on his stage the people saw exhibited their passions, their judgments of the modern, their jealousies, their hatreds and their ambitions. Brothers
of the kind existed all over France. In Paris there were the Enfants sans Souci, the Basochiens, the Confrérie de la Passion and the Soverain Empire de Gallié; at Dijon there were the Mère Folle and her family; in Flanders the Société des Arbalétriers played under the patronage of the Prince de Condé; and in Lyons the one and only Gringoire was said to have been towards 1512 Gringoire, who was the accredited defender of the policy of Louis XII., and had already written many political poems, represented the Jeu du Prince des Sots et Mère Sotte. It was at the moment when the French dispute with Julius II. was at its height. Mère Sotte was disguised as the Church, and disputed the question of the temporal power with the prince. The political meaning was even more thinly veiled in the second part of the entertainment, a morally named L'Homme obstiné, the principal personage representing the pope, the performance concluded with a farce. Gringoire adopted for his device on the frontispiece of this trilogy, Tout par Raison, Raison par Tout, Par tout Raison. He has been called the Aristophane des Halles. In one respect at least he resembles Aristophanes. He is serious in his Merrill; there is purpose behind his extravagances. The Church was further attacked in a poem printed about 1510, La Chasse du cerf des cerfs (serf des serfs, i.e. seres servantum), under which title that of the pope is thinly veiled. About 1514 he wrote his mystery of the French edition of Saint-Louis par les zibaldones des isles de la mer, for the entertainment of the masons and carpenters. He became in 1518 herald at the court of Lorraine, with the title of Vaudemont, and married Catherine Roger, a lady of gentle birth. During the last twenty years of a long life he became orthodox, and dedicated a Blason des héroïques to the duke of Lorraine. There is no record of the payment of his salary as a herald after Christmas 1538, so that he died probably in 1539.

His works were edited by C. d'Héricault and A. de Montaiglon for the Bibliothèque étoilée. The 1858 edition was incomplete, and was supplemented by a second volume in 1877 by Montaiglon and M. James de Rothschild. These volumes include the works of Gringoire, except the poem collection of Le Garçon de la vente; in addition, Les Folles Entreprises (1509), a collection of didactic and satirical poems, chiefly ballades and rondesoux, one section of which is devoted to the exposition of the tyranny of the nobles, and another to the vices of the clergy; L'Entrepriente de Venise (c. 1509), a poem in seven-lined stanzas, giving a list of the Venetian fortresses which belonged, according to Gringoire, to other powers; L’Espoir de paix (1st ed. not dated; another, 1510), a verse treatise on the deeds of 1509, its title page being dedicated to Louis XII., and La Conquête (1510), a verse description of an epidemic, apparently influenza. For details of his other satires, Les Abus du monde (1509), Complainte de poissons, Les Fables en chansons du poète Gringoire, and a last work, Chansons royales (on the Passion, 1527), Heures de Notre Dame (1525); for a collection of tales in prose and verse, taken from the Gestes Romanorum, entitled Les Fantasies de Mère Sotte (1516), see LAMBERT'S Most of these works conclude with an acrostic giving the name of the author.

The Chasteau de labour was translated into English by Alexander Barclay and printed by Wynken de Worde in 1506. Barclay's translation was edited (1900) with his original for the Roxburghe Club by Mr A. W. Pollard, who provided an account of Gringoire, and a bibliography of the book. See also, for the Jeu du Prince des Sots, Petit de Julleville, La Comédie et les scènes en France au moyen âge, pp. 151-168 (Paris, 1886); for Saint Louis, the same author's Les Mystères, i. 311 et seq., i. 838-597 (1880), with further bibliographical references; and E. Picot, Gringoire et les comédiens suisses (1875). Picot said that Gringoire was the original of the poet quoted in Victor Hugo’s Notre-Dame de Paris, nor is there more foundation in fact for the once-prose comedy of Théodore de Banville.

GRINNELL, a city in Poweshiek county, Iowa, U.S.A., 55 m. E. by N. of Des Moines. Pop. (1900) 3660, of whom 274 were foreign-born (1900) 4534; (1910) 5000. Grinnell is served by the Chicago, Rock Island & Pacific and the Iowa Central ways. It is the seat of Iowa College (coeducational), founded in 1847 by the Iowa Band (Congregationalists and graduates of New England colleges and Andover Theological Seminary, who had devoted themselves to home missionary educational work in Iowa, and who came to Iowa in 1843), and by a few earlier pioneers from New England. The college opened in 1848 at Davenport, and in 1859 removed to Grinnell, where there was a school called Grinnell University, which it absorbed. Closely affiliated with the college are the Grinnell Academy and the Grinnell School of Music. In 1907-1908 the College had 493 students, the Academy had 129 students, and the School of Music had 114 students. Among the manufactures are carriages and gloves. The city was named in honour of one of its founders, Josiah Bushnell Grinnell (1821-1891), a Congregational clergyman, friend of and sympathizer with John Brown, and from 1863 to 1867 a member of the National House of Representatives. Grinnell was settled in 1854, was incorporated as a town in 1865, and in 1882 was chartered as a city of the second class. In 1882 it suffered severely from a cyclone.

GRIQUALAND EAST and GRIQUALAND WEST, territorial divisions of the Cape Province of the Union of South Africa. Griqualand East, which lies south of Basutoland and west of Natal, is so named from the settlement there in 1862 of Griqua under Adam Kok. It forms part of the Transkeian Territories of the Cape, and is described under KAFFRARIA. Griqualand West, formerly Griqualand simply, also named after its Griqua inhabitants, is part of the great tableland of South Africa. It is bounded S. by the Orange river, W. and N. by Bechuanaoland, E. by the Transvaal and Orange Free State Province, and has an area of 15,197 sq. m. It has a general elevation of 3000 to 4000 ft. above the sea, low ranges of rocky hills, the Kaap, Asbestos, Vansattie and Langeberg mountains, traversing its western portion in a general N.-S.W. direction. The only perennial rivers are in the eastern district, through which the Vaal flows from a point a little above Fourteenth Streets to its junction with the Orange (160 m.). In this part of its course the Vaal receives the Harts river from the north and the Riet from the east. The Riet, 4 m. within the Griqualand frontier, is joined by the Modder. The banks of the rivers are shaded by willows; elsewhere the only tree is the mimosa. The greater part of the country is barren, merging N.W. into absolute desert. The soil is poor and wherever irrigated, extremely fertile. The day climate is hot but the nights are frequently cold. Rain rarely falls, though thunderstorms of great severity occasionally sweep over the land, and sandstorms are prevalent in the summer. A portion of the country is adapted for sheep-farming and the growing of crops, horse-breeding is carried on at Kimberley, and asbestos is worked in the southwestern districts, but the wealth of Griqualand West lies in its diamonds, which are found along the banks of the Vaal and in the district between that river and the Riet. From the first discovery of diamonds in 1867 up to the end of 1905 the total yield of diamonds was estimated at 131 tons, worth £5,000,000.

The chief town is Kimberley (q.v.), the centre of the diamond mining industry. It is situated on the railway from Cape Town to the Zambesi, which crosses the country near its eastern border. Three miles south of Kimberley is Beaufield (q.v.). On the banks of the Vaal are Barkly West (q.v.), Warmbont (pop. 800) and Warrenton (pop. 1300); at all these places are river diggings, diamonds being found along the river from Fourteenth Streets to the Harts confluence. Warrenton is 44 m. N. by rail from Kimberley. Douglas (pop. 300), on the south bank of the Vaal, 12 m. above its confluence with the Orange, is the centre of an agricultural district, a canal 93 m. long serving to irrigate a considerable area. Thirty-five miles N.W. of Douglas is Griquatown (pop. 401), the headquarters of the first Griqua settlers. Campbell (pop. 250) is 30 m. E. of Griquatown, and Postmasburg 42 m. N. by W. A census taken in 1877 showed the population of Griqualand West to be 45,477, of whom 12,347 were whites. At the census of 1891 the population was 83,215, of whom 26,602 were whites, and in 1904 the population was 131,838, of whom 32,215 were whites.

History.—Before the settlement in it of Griqua clans the district was thinly inhabited by Bushmen and Hottentots. At the end of the 18th century a horde known as Bastaards, descendants of Dutch farmers and Hottentot women, led a nomadic life on the plains south of the Orange river. In 1803 a missionary named Anderson induced a number of the Bastaards with their chief Barend Barends to settle north of the river, and a mission station was formed at a place where there was a strong
flowing fountain, which has now disappeared, which gave the name of Klauwater to what is now known as Griquatown or Griquastad. Klauwater became a retreat for other Bastards, Hottentot refugees, Kaffirs and Bochuanas. From LittleNamaqualand came a few half-breeds and others under the leadership of Adam Kok, son of Cornelius Kok and grandson of Adam Kok (c. 1710–1795), a man of mixed white and Hottentot blood who is regarded as the founder of the modern Griquas.

The settlement prospered, and in 1813, at the instance of the Rev. John Campbell, who had been sent by the London Missionary Society to inspect the country, the tribesmen abandoned the name of Bastards in favour of that of Griquas, some of them professing descent from a Hottentot tribe, originally settled near Saldanha Bay, called by the early Dutch settlers at the Cape Charleburg or Griquiriga. Under the guidance of Adam Kok, the Griquas made some progress in civilization, and many professed Christianity. Adam Kok and Barends having moved eastward in 1820, those who remained behind elected as their head man a teacher in the mission school named Andries Waterboer, who successfully administered the settlement, and by defeating the Makololo raiders greatly increased the prestige of the tribe. Meanwhile Adam Kok and his companions had occupied part of the country between the Molder and Orange rivers. In 1835 Kok settled at the mission station Philippolis, having previously, in 1834, established a farm at Bastaards, and in his country time had pacified the Bushmen inhabiting that region. He died about 1835, and after a period of civil strife was succeeded by his younger son, Adam Kok III. This chief in November 1843 signed a treaty placing himself under British protection.

Many Dutch farmers were settled on the land he claimed. In 1845 he received British military aid in a contest with the white settlers, and in 1848 helped the British under Sir Harry Smith against the Boers (see Orange Free State: History). Eventually finding himself straitened by the Boers of the newly established Orange Free State, he returned to his home in 1861–1863 with his people, estimated by Kaffir wars now known as Griqualand East. His sovereign rights to all territory north of the Orange he sold to the Free State for £4000. He founded Kokstad (q. v.) and died in 1876. Waterboer, the principal Griqua chief, had entered into treaty relations with the British government as early as 1834, and he received a subsidy of £150 a year. He proved a staunch ally of the British, and kept the peace on the Cape frontier to the day of his death in 1852. He was succeeded by his son Nicholas Waterboer. Under the conditions of the treaty, the Griqua country was in a decline induced by the indolence of the people and intensified by the drying up of the water supplies, cattle plague and brandy drinking. During this period white settlers acquired farms in the country, and the loss of their independence by the Griquas became inevitable. The discovery of diamonds along the banks of the Vaal in 1867 entirely altered the fortunes of the country, and by the end of 1869 the rush to the alluvial diggings had begun. At the diggers' camps the Griquas exercised no authority; but over part of the district the South African Republic and the Orange Free State claimed sovereignty. At Klip Drift (now Barkly West) the diggers formed a regular government and elected Theodore Parker as their president. Most of the diggers being British subjects, the high commissioner of South Africa interfered, and a Cape official was appointed magistrate at Klip Drift, President Parker resigning office in February 1871. At this time the "dry diggings," of which Kimberley is the centre, had been discovered, and over the miners there the Orange Free State asserted jurisdiction. The land was, however, claimed by Nicholas Waterboer, who, on the advice of his agent, David Arnott, petitioned the British government to have the claims decided, and on the 27th of October 1871 proclamations were issued by the high commissioner receiving Waterboer and his Griquas as British subjects and defining the limits of his territory. In addition to the Kimberley district this territory included that part of the diamondiferous area which had been claimed by the Transvaal, but which had been declared, as the result of the arbitration of R. W. Keate, lieutenant-governor of Natal, part of Waterboer's land. On the 4th of November a small party of Cape Mounted Police took possession of the dry diggings and hoisted the British flag. Shortly afterwards the representative of the Orange Free State withdrew. The Free State was greatly incensed by the action of the British government, but the dispute as to the sovereignty was settled in 1876 by the payment of £50,000 by the British to the Free State as compensation for any injury inflicted on the state.

The diggers, who under the nominal rule of the Transvaal and Free State had enjoyed practical independence, found the new government little for their benefit, and a period of disorder ensued, which was not put an end to by the appointment in January 1873 of Mr. (afterwards Sir) Richard Southey as sole administrator, in place of the three commissioners who had previously exercised authority. In the July following the territory was made a crown colony and Southey's title changed to that of lieutenant-governor. The government remained ineffective, chiefly through the diggers' neglect of public character, the heavy taxation exacted, and the inadequate protection of property. They formed a society for mutual protection, and the discontent was so great that an armed force was sent (early in 1875) from the Cape to overawe the agitators. At the same time measures were taken to render the government more popular. The settlement of the dispute with the Free State paved the way for the annexation of Griqualand to the Cape Colony on the 15th of October 1880.

**GRISAILLE**, a French term, derived from gris, grey, for painting in monochrome in various shades of grey, particularly used in decoration to represent objects in relief. The frescoes of the roof of the Sistine chapel have portions of the design in grisaille. At Hampton Court the lower part of the decoration of the great staircase by Verrio is in grisaille. The term is also applied to monochrome painting in enamels, and also to stained glass; a fine example of grisaille glass is in the window known as the Five Sisters, at the end of the north transept in York cathedral.

**GRISALDA**, a heroine of romance. She is said to have been the wife of Walter, marquis of Saluces or Saluzzo, in the 11th century, and her misfortunes were considered to belong to history when they were handled by Boccaccio and Petrarch, although the probability is that Boccaccio borrowed his narrative from a Provençal fabliaux. He included it in the recitations of the tenth day (Decameron), and must have written it about 1350. Petrarch related it in a Latin letter in 1373, and his translation formed the basis of much of the later literature. The letter was printed by Ulrich Zel about 1470, and often subsequently. It was translated into French as La Pauvresse.  

1 The Griquas, as a distinct tribe, numbered at the Cape census of 1904 but 6289. They have largely intermarried with Kaffir and Bochuanas tribes.  
2 The order of discovery of the chief mines was:—Dutoitspan, Sept. 1870; Beaufortain, Nov. 1870; De Beers, May 1871; Colesberg Kop (Kimmerly), July 1871.
GRISI—GRISONS

Griselids and printed at Bréban-Loudéac in 1884, and its popularity is shown by the number of early editions quoted by Brunet (Monuumes du livre, s.n. Petrarca). The story was dramatized in 1505, and a Mystère de Griseldis, marquise de Saluces par personnage was printed by Jehan Bonfons (no date). Chaucer followed Petrarch’s version in the Canterbury Tales. Ralph Redcliffe, who flourished under Henry VIII., is said to have written a play on the subject, and the story was dramatized by Thomas Dekker, Henry Chettle and W. Haughton in 1603.

An example of the many ballads of Griselda is given in T. Deloney’s Garland of Good Will (1685), and the 17th-century chap-book, The History of the Prince of Bologna (1656), mentions a B. Wilkin for the Villton Society with a bibliographical and literary introduction.

GRISI, GIULIA (1811–1869), Italian opera-singer, daughter of one of Napoleon’s Italian officers, was born in Milan. She came of a family of musical gifts, her maternal aunt Josephina Grassini (1773–1850) being a famous opera-singer both on the continent and in London; her mother had also been a singer, and her elder sister Giudetta and her cousin Carlotta were both exceedingly talented. Giulia was trained to a musical career, and made her stage début in 1828. Rossini and Bellini both took an interest in her, and at Milan she was the first Adalgisa in Bellini’s Norma, in which Paganini took the title-part. Grisi appeared in the 1831-2 season in Rossini’s opera and had a great success; and in 1834 she appeared in London. Her voice was a brilliant dramatic soprano, and her established position as a prima donna continued for thirty years. She was a particularly fine actress, and in London opera her association with such singers as Lablache, Rubini, Tamburini and Mario was long remembered as the palmy days of Italian opera. In 1854 she toured with Mario in America. She had married Count de Melcy in 1836, but this ended in a divorce; and in 1836 she married Mario (q.v.). She died in Berlin on the 29th of November 1869.

GRISON (Galictis vittata), a carnivorous mammal, of the family Mustelidae, common in Central and South America and Mexico. It is about the size of a marten, and has the upper surface of a bluish-grey tint, and the under surface is dark brown. The grison lives on small mammals and birds, and in settled districts is destructive to poultry. Allamand’s grison (G. allamanni), with the same range, is somewhat larger. Another member of the genus is the tayra or taira (G. barbara), about as large as an otter, with a range from Mexico to Argentina. This species lives on smaller mammals, and is more timid than the grison (see Cuon).

GRISONS (Ger. Grasbünder), the most easterly of the Swiss cantons and also the largest in extent, though relatively the most sparsely populated. Its total area is 2753-2 sq. m., of which 1634.4 sq. m. are classed as “productive” (forests covering 503.1 sq. m. and vineyards 13.3 sq. m.), but it has also 138.6 sq. m. of glaciers, ranking in this respect next after the Valais and after Bern. The whole canton is mountainous, the principal glacier groups being those of the Tüdi, N. (11,887 ft.), of Medel, S.W. (Piz Medel, 10,500 ft.), of the Rhinalwald or the Adula Alps, S.W. (Rheinwaldhorn, 11,140 ft.), with the chief source of the Rhine, of the Bernina, S.E. (Piz Bernina, 13,304 ft.), the most extensive, of the Albula, E. (Piz Kesch, 11,228 ft.), and of the Silvretta, N.E. (Piz Lainard, 11,201 ft.). The principal valleys are those of the upper Rhine and of the upper Inn (or Engadine, q.v.). The three main sources of the Rhine are in the canton. The valley of the Vorder Rhine is called the Bündner Oberland, that of the Mittel Rhine the Val Medel, and that of the Hinter Rhine (the principal), in different parts of its course, the Rhinalwald, the Schams valley and the Domleschg valley, while the upper valley of the Julia is named the Oberhalbstein. The chief affluent of the Rhine in the canton are the Glenner (flowing through the Lugnetz valley), the Avers Rhine, the Albula (swollen by the Julia and the Landwasser), the Flessur (Schanfigg valley) and the Landquart (coming from the Prättigau). The Rhine and the Inn flow respectively into the North and the Black Seas. Of other streams that of Val Mesocco joins the Ticino and so the Po, while the Maira or Mera (Val Bregaglia) and the Poschiavino join the Adda, and the Rambach (Münster valley) the Adige, all four thus ultimately reaching the Adriatic Sea. The inner valleys are the highest in Central Europe, and among the loftiest villages are Juf, 6998 ft. (the highest permanently inhabited village in the Alps), at the head of the Avers glen, and St Moritz, 6037 ft., in the Upper Engadine. The lower courses of the various streams are rent by remarkable gorges, such as the Via Mala, the Rofa, the Schyn, and those in the Avers, Medels and Lugnetz glens, as well as that of the Züge in the Landwasser glen. Below Coire, near Malans, good wine is produced, while in the Val Mesocco, &c., maize and chestnuts flourish. But the forests and the mountain pasturages are the chief source of wealth. The lower pastures maintain a fine breed of cattle, while higher up, at the Bernina, Engadine, Val Poschiavo Gsou and Engadin, an industry of Bergamasque shepherds. There are many mineral springs, such as those of St Moritz, Schuls, Alvaneu, Fideris, Le Prese and San Bernardino. The climate and vegetation, save on the southern slope of the Alps, are alpine and severe. But yearly vast numbers of strangers visit different spots in the canton, especially Davos (q.v.), Arosa and the Engadine. As yet there are comparatively few railways. There is one from Ma lenfeld (continued north to Constance and north-west to Zürich) to Coire (11 m.), which sends off a branch line from Landquart, E., past Klosters to Ilanz (56). The line from Landquart to Reichenau (16 m.), whence one branch runs S.S.E. beneath the Albula, to St Moritz (50 m.), and another S.W. up the Hinter Rhine valley to Ilanz (20 m.). There are, however, a number of fine carriage roads across the passes leading to or towards Italy. Besides those leading to the Engadine may be noted the roads from Ilanz past Disentis over the Oberalp Pass (6710 ft.) to Andermatt, from Disentis over the Lukmanier Pass (6289 ft.) to Biasca, on the St Gotthard railway, from Reichenau past Thusis and Splugen over the San Bernardino Pass (6760 ft.) to Bellinzona on the same railway line, and from Splugen over the Splügen Pass (6046 ft.) to Cannovia. The Sempach Pass (7583 ft.), from the Juli route to the Maloja route has now only a mule path, but was probably known in Roman times (as was probably the Splugen), and was much frequented in the middle ages.

The population of the canton in 1900 was 104,520. Of this number 55,155 (mainly near Coire and Davos, in the Prättigau and in the Schanfigg valley) were Protestants, while 49,142 (mainly in the Bündner Oberland, the Val Mesocco and the Oberhalbstein) were Romanists, while there were also 114 Jews (83 of whom lived in Davos). In point of language 48,762 (in the Bündner Oberland, the Bregaglia valley and the valley of Poschiavo, but including a number of Italian labourers engaged on the construction of the Albulà railway) were Italian-speaking. But the characteristic tongue of the Grisons is a survival of an ancient Romance language (the lingua rusticca of the Roman Empire), which has lagged behind its sisters. It has a scanty printed literature, but is still widely spoken, so that, of the 38,651 persons in the Swiss Confederation who speak it, no fewer than 36,472 are in the Grisons. It is distinguished into two dialects: the Romonsh (sometimes wrongly called Romansch), which prevails in the Bündner Oberland and in the Hinter Rhine valley (Schams and Domleschg), and the Ladin (closely related to the tongue spoken in parts of the South Tyrol), that survives in the Engadine and in the neighbouring valleys of Bergün, Oberhalbstein and Münster. (See F. Rausch’s Geschichte der Literatur des rhaeto-romanschen Volkes, Frankfort, 1870, and Mr Coolidge’s bibliography of this language, given on pp. 23-23 of Lorria and Martel’s Le Massif de la Bernina, Zürich, 1873.) The Grisons are the only province of this Romance-speaking population that has islets (mostly, if not entirely, due to immigration in the 13th century from the German-speaking Upper Valais) of German-speaking inhabitants, so that in the Vals and Safien glens, and at Obersaxen (all in the Bündner Oberland), in the Rheinwald (the highest part of the Hinter Rhine valley), and in the Avers glen (middle reach of the Hinter Rhine valley), as well as in and around Davos itself.

There is not much industrial activity in the Grisons. A
A considerable portion of the population is engaged in attending to the wants of the foreign visitors, but there is a considerable trade with Italy, particularly in the wines of the Valtellina, while many young men seek their fortunes abroad (returning home after having accumulated a small stock of money) as confectioners, pastry-cooks and coffee-house keepers. A certain number of lead and silver mines were formerly worked, but are now abandoned. The capital of the canton is Coire (q.v.).

The canton is divided into 14 administrative districts, and includes 224 communes. It sends 2 members (elected by a popular vote) to the Federal Ständerrat, and 5 members (also elected by a popular vote) to the Federal Nationalrat. The existing cantonal constitution was accepted by the people in 1862, and came into force on 1st January 1894. The legislature (Grossrat—no numbers fixed by the constitution) is elected for 2 years by a popular vote, as are the 5 members of the executive (Kleinrat) for 3 years. The "obligatory referendum" obtains in the case of all laws and important matters of expenditure, while 2000 citizens can demand ("facultative referendum") a popular vote as to resolutions and ordinances made by the legislature. Three thousand citizens also have the right to "initiative" as to legislative projects. The executive and legislative measures are required for a proposed revision of the cantonal constitution. In the revenue and expenditure of the canton the taxes are never counted. This causes an apparent deficit which is carried to the capital account, and is met by the land tax (art. 19 of the constitution), so that there is never a real deficit, as the amount of the land tax varies annually according to the amount that must be provided. In the pre-1799 constitution of the three Raetian Leagues the system of the "referendum" was in working as early as the 16th century, not merely as between the three Leagues themselves, but as between the bailiwicks (Hochgerichte), the sovereign units within each League, and sometimes (as in the Upper Engadine) between the villages composing each bailiwick.

The greater part (excluding the three valleys where the inhabitants speak Italian) of the modern canton of the Grisons formed the southern part of the province of Raetia (probably the aboriginal inhabitants, the Raeti, were Celts rather than, as was formerly believed, Etruscans), set up by the Romans after their conquest of the region in 15 B.C. The Romanized inhabitants were a certain extent (The Romans or their Tongue are a survival of the Roman dominion) Teutonized under the Ostrogoths (A.D. 493-537) and under the Franks (from 537 onwards). Governors called Praesides are mentioned in the 7th and 8th centuries, while members of the same family occupied the episcopal see of Coire (founded 5th centuries). About 806 Charles the Great made this region into a county, but in 831 the bishop procured for his dominions exemption ("immunity") from the jurisdiction of the counts, while before 847 his see was transferred from the Italian province of Milan to the German province of Mainz (Mayence) and was thus cut off from Italy to be joined to Germany. In 916 the region was united with the duchy of Alamannia, but the bishop still retained practical independence, and his wide-spread dominions placed him even above the abbots of Disentis and Pfäfers, who likewise enjoyed "immunity." In the 10th century the bishop obtained fresh privileges from the emperors (besides the Val Bregaglia in 960), and so became the chief of the many feudal nobles who struggled for power in the region. He became a prince of the empire in 1190 and later allied himself with the rising power (in the region) of the Habsburgs. This led to the 1367 to the foundation of the League of God's House or the Gotteshausbund (composed of the city and chapter of Coire, and of the bishop's subjects, especially in the Engadine, Val Bregaglia, Domleschg and Oberhalbstein) in order to stem his rising power, the bishop entering it in 1392. In 1395 the abbey of Disentis, the men of the Lugnet valley, and the great feudal-lords of Räzuns and Sax (in 1390 the counts of Werdenberg came in) formed another League, called the Ober Bund (as comprising the highlands in the Vorder Rhine valley) and also wrongly the "Grey League" (as the word interpreted "grey") is simply a misreading of...

GRISWOLD, RUFUS WILMOT (1815-1857), American editor and compiler, was born in Benson, Vermont, on the 15th of February 1815. He travelled extensively, worked in newspaper offices, was a Baptist clergyman for a time, and finally became a journalist in New York City. He was a member of the staffs of The Brother Jonathan, The New World (1839-1840) and The New Yorker (1840). From 1841 to 1844 he edited Graham's Magazine (Philadelphia), and added to its list of contributors many leading American writers. From 1845 to 1852 he edited the International Magazine (New York), which in 1852 was merged into Harper's Magazine. He died in New York City on the 27th of August 1857. He is best known as the compiler and editor of various anthologies (with brief biographies and critiques), such as Poets and Poetry of America (1842), his most popular and valuable book, Poets Writers of America (1848); and Sacred Poets of England and America (1849). Of his own writings his Republican Court: or American Society in the Days of Washington (1854) is the only one of permanent value. He edited the first American edition of Milton's prose works (1845), and, as literary executor, edited, with James R. Lowell and N. P. Willis, the works (1850) of Edgar Allan Poe. Griswold's great contemporary reputation as a critic has not stood the test of time; but he rendered a valuable service in making Americans better acquainted with the poetry and prose of their own countrymen.

GRIVET, a monkey, Cercopithecus sabacus, of the guenon group, nearly allied to the green monkey. It is common throughout equatorial Africa. The chin, whiskers and a broad band across the forehead, as well as the underparts, are white, and the head and back olive-green. These monkeys are very commonly seen in menageries.

GRIST (adapted from the Dutch goot, great, thick; cf. Griswold, Gros, Gros). Lat. grossus gives Italian groso, Fr. gros, as names for the coin), a name applied as early as the 13th century on the continent of Europe to any large or thick coin. The groat was almost universally a silver coin, but its value varied considerably, as well at different times as in different countries. The English grist was first coined in 1351, of a value somewhat higher than a penny. The continuous debasement of both the penny and the grist left the latter finally worth four pence. The issue of the grist was discontinued after 1662, but a coin worth fourpence was again struck in 1836. Although frequently a large coin, it was more often a groat than a "fourpenny piece." Its issue was again discontinued in 1836. The grist was imitated in Scotland by a coin struck by David II. in 1358. In Ireland it was first struck by Edward IV. in 1460.

GROCHY, GROCHY, Grocher, literally one who sells by the gross, a wholesale dealer; the word is derived through the O. Fr. form, grossia, from the Med. Lat. grossarius, defined by du Cange, Glossarium, s.v. Grossaret, as solida mercei propola. The name, as a general one for dealers by wholesale, "engrossers" as opposed to "regrators," the retail dealers, is found with the commodity attached; thus in the Moximenta Gildalicia ("Rolls") series B. 304 (quoted in the New English Dictionary) is found an allusion to groccus de vin, cf. grosser de fyshe, Surtees Misc. (1888) 63, for the customs of Malton (quoted ib.). The specific application of the word to one who deals either by wholesale or retail in tea, coffee, cocoa, dried fruits, spices, sugar and all kinds of articles of use or consumption in a household is connected with the history of the Grocers' Company of London, one of the twelve "great" livery companies. In 1345 the pepperers and the spicers amalgamated and were known as the Fraternity of St Anthony. The name grocers' first appears in 1375 in the records of the company. In 1386 the association was granted a right of search over all "spicers" in London, and in 1394 they obtained the right to inspect or "garble" spices and other "subtil vares." Their first charter was obtained in 1428; letters patent in 1447 granted an extension of the right of search over the whole county, but removed the "liberties" of the city of London. They sold all kinds of drugs, medicines, ointments, plasters, and medicated and other waters. For the separation of the apothecaries from the grocers in 1617 see A. L. Pitman, "The Grocers," in the Dictionary of National Biography. See The Grocery Trade, by J. Aubrey Rees (1910).

GROCYN, WILLIAM (1446?-1519), English scholar, was born at Colerne, Wiltshire, about 1446. Intended by his parents for the church, he was sent to Winchester College, and in 1465 was elected to a scholarship at New College, Oxford. In 1467 he became a fellow, and had among his pupils William Warham, afterwards archbishop of Canterbury. In 1470 he accepted the rectory of Newton Longville, in Buckinghamshire, but continued to reside at Oxford. As reader in divinity in Magdalen College in 1481, he held a disputations with John Taylor, professor of divinity, in presence of King Richard III., and the king acknowledged his skill as a debater by the present of a buck and five marks. In 1483 he became prebendary of Lincoln cathedral. About 1488 Grocyn left England for Italy, and before his return in 1491 he had visited Florence, Rome and Padua, and studied Greek and Latin under Demetrius Chalchondyles and Politian. As lecturer in Exeter College he found an opportunity of in-doectrinating his countrymen in the new Greek learning.

Erasmus says in one of his letters that Grocyn taught Greek at Oxford before his visit to Italy. The Warden of New College, Thomas Chaundler, invited Cornelius Vitelli, then on a visit to Oxford, to act as proctor. This was about 1475, and as Vitelli was certainly familiar with Greek literature, Grocyn may have learnt Greek from him. He seems to have lived in Oxford until 1499, but when his friend Colet became dean of St Paul's in 1504 he was settled in London. He was chosen by his friend to deliver lectures in St Paul's; and in this connexion he gave a singular proof of his honesty. He had at first denounced all who impugned the authenticity of the Hierarchia ecclesiastica ascribed to Dionysius the Areopagite, but, being led to modify his views by further investigation, he openly declared that he had been completely mistaken. He also counted Linacre, William Lily, William Latimer and More among his friends, and Erasmus writing in 1514 says that he was supported by Grocyn in London, and calls him "the friend and preceptor of us all." He held several preferments, but his generosity to his friends involved him in continual difficulties, and though in 1506 he was appointed Archdeacon Warham's recommendation master or warden of All Hallows College at Maidstone in Kent, he was not allowed to hold benefices, and he sold his pension as an 

GRISWOLD—GROCHY
to the poor and the purchase of books for poor scholars. With the exception of a few lines of Latin verse on a lady who snow-balled him, and a letter to Aldus Manutius at the head of Linacre's translation of Proclus' Sphaera (Venice, 1490), Grocyn has left no literary proof of his scholarship or abilities. His proposal to execute a translation of Aristotle in company with Linacre and Lattimer was never carried out. Wood assigns some Latin works to Grocyn, but on insufficient authority. By Erasmus he has been described as "vir severissimae castissimae vitae, ecclesiasticarum constitutionum observantissimum pene usque ad superstitionem, scholasticae theologiae ad unguem doctus et alicubi habens, demum in omni disciplinarum genere exacte versatus" (Declarationes ad censuras facultatis theologiae Parisianae, 1532).

An account of Grocyn by Professor Burrows appeared in the Oxford Historical Society's Collectanea (1890).

GRODNO, one of the two large provinces of the Russian Empire, lying between 54° 40' and 52° N. and between 22° 12' and 26° E., and bounded N. by the government of Vilna, E. by Minsk, S. by Volynia, and W. by the Polish governments of Lomza and Sledice. Area, 14,926 sq. m. Except for some hills (not exceeding 325 ft.) the E. is a uniform plain, and is drained chiefly by the Bug, Niemen, Narev and Bzur, all navigable. There are also several canals, the most important being the Augustowgo and Oginsky. Granite and gneisses crop out along the Bug, Cretaceous, and especially Tertiary, deposits elsewhere. The soil is mostly sandy, and in the district of Grodno and along the rivers is often drift-sand. Forests, principally of Coniferæ, cover more than one-fourth of the area. Amongst them are some of vast extent, e.g., those of Grodno (410 sq. m.) and Byelovita (Bialowieza) (376 sq. m.), embracing wide areas of marshy ground. In the last mentioned forest the wild ox survives, having been jealously preserved since 1803. Peat bogs, sometimes as much as 40 to 50 ft. thick, cover extensive districts. The climate is warm and cold; the average mean temperature being 44° F., the January mean 22-5° and the July mean 64-5°. The rainfall amounts to 211-8 in.; hail is frequent. Agriculture is the predominant industry. The peasants own 424% of the land, that is, about 4,000,000 acres, and of these over 2,250,000 acres are arable. The crops principally grown are potatoes, rye, oats, wheat, flax, hemp and some tobacco. Horses, cattle and sheep are bred in fair numbers. The principal manufactured articles are flour, sugar, and tobacco. In woolens this government ranks second (after Moscow) in the empire, the centre of the industry being Byelostok.

Other factories produce silk, shoddy and leather. The government is crossed by the main lines of railway from Warsaw to St. Petersburg and from Warsaw to Moscow. The population numbered 1,008,521 in 1870 and 1,165,630 in 1877; of these last 769,381 were women and 255,049 were urban. In 1866 it was estimated at 1,826,600. White Russians predominate (54%); then follow Jews (17-4%), Poles (10%), Lithuanians and Germans. The government is divided into nine districts, the chief towns, with their populations in 1897, being Grodno (q.v.), Brest-Litovsk (pop. 42,812 in 1901), Byelisk (7461), Byelostok or Bialystok (65,781 in 1901), Kobrin (10,363), Pruzhany (7634), Slonim (15,893), Sokols (7593) and Volkovsk (10,384). In 1795 Grodno, which had been Polish for ages, was annexed by Russia.

GRODNO, a town of Russia, capital of the governorship of the same name in 53° 40' N. and 23° 30' E., on the right bank of the Niemen, 160 m. by rail N.E. of Warsaw and 98 m. S.W. of Vilna, on the main line to St. Petersburg. Pop. (1901) 41,736, nearly two-thirds Jews. It is an episcopal see of the Orthodox Greek church and the headquarters of the II. Army Corps. It has two old castles, now converted to other uses, and two churches (16th and 17th centuries). Tobacco factories and distilleries are important; machinery, soap, candles, vehicles and firearms are also made. Built in the 12th century, Grodno was almost entirely destroyed by the Mongols (1241) and Teutonic knights (1254 and 1392). Stephen Bathory, king of Poland, made it his capital, and died there in 1586. The Polish Estates frequently met at Grodno after 1673, and there in 1703 they signed the second partition of Poland. It was at Grodno that Stanislaus Poniatowski resigned the Polish crown in 1705.

GROEN VAN PRINSERER, GUILLAUME (1801-1870), Dutch politician and historian, was born at Voorburg, near the Hague, on the 21st of August 1801. He studied at Leiden university, and graduated in 1823 both as doctor of literature and LL.D. From 1829 to 1833 he acted as secretary to King William I. of Holland, afterwards took a prominent part in Dutch home politics, and gradually became the leader of the so-called Right party, or revolutionary party, both in the Second Chamber, of which he was for a time chairman, and in the Commons. He was great admirer of Thiers and Stahl and the doctrines of Guizot and Stahl found an eloquent exponent. They permeate his controversial and political writings and historical studies, of which his Handbook of Dutch History (in Dutch) and Maurice et Barneveld (in French, 1875, a criticism of Motley's Life of Van Olden-Barnevel) are the principal. Groen was violently opposed to Thorbecke, whose principles he denounced as ungodly and revolutionary. Although he lived to see these principles triumph, he never ceased to oppose them until his death, which occurred at the Hague on the 19th of May 1870, and in his last book (of which the best known is the editor of the Archives de correspondance de la maison d'Orange (12 vols., 1835-1845), a great work of patient erudition, which procured for him the title of "the Dutch Gachard." J. L. Motley acknowledges his indebtedness to Groen's Archives in the preface to his Rise of the Dutch Republic, at a time when the American historian had not yet made the acquaintance of King William's archivist, and also bore emphatic testimony to Groen's worth as a writer of history in the correspondence published after his death. At the first reception, in 1868, of Motley at the royal palace at the Hague, the king presented him with a copy of Groen's Archives as a token of appreciation and admiration of the work done by the "worthy indicator of William I., prince of Orange." This copy, bearing the king's autograph inscription, afterwards came into the possesion of Sir William Vernon Harcourt, Motley's son-in-law.

GROIN. (1) An obsolete word for the grunting of swine, from Lat. grunniere, and so applied to the snout of a pig; it is probably the origin of the word, more commonly spelled "groyne," for a small timber framework or wall of masonry used on sea coasts as a breakwater to prevent the encroachment of sands. (2) The angle of (of uncertain origin; from an older word) "grinde;" the derivation from "grain," an obsolete word meaning "fork," cannot, according to the New English Dictionary, be accepted), in anatomy the folds or grooves formed between the lower part of the abdomen and the thighs, covering the inguinal glands, and so applied in architecture to the angle or "arris" formed by the intersection of two vaults crossing one another, occasionally called by workmen "groin point." If the vaults are both of the same radius and height, their intersections lie in a vertical plane; in other cases they form winding curves for which it is difficult to provide centering. In early medieval vaulting this was sometimes arranged by a slight alteration in the geometrical curve of the vault, but the problem was not satisfactorily solved until the introduction of the rib which henceforth ruled the vaulting surface of the web or cell (see VAULT). The name "Welsh groin" or "underpitch" is generally given to the vaulting surface or web where the main longitudinal vault is higher than the cross or transverse vaults; as the transverse rib (of much greater radius than that of the wall rib), projected diagonally in front of the latter, the filling-in or web has to be carried back from the transverse to the wall rib. The term "groin centering" is used where, in groining without ribs, the whole surface is supported by centering during the erection of the vaulting. In ribbed work the stone ribs only are supported by timber ribs during the progress of the work, any light stuff being used while filling in the spandrels. (See VAULT.)

GROLMANN, KARL WILHELM GEORG VON (1777-1843), Prussian soldier, was born in Berlin on the 30th of July 1777. He entered an infantry regiment when scarcely thirteen, became an ensign in 1795, second lieutenant 1797, first lieutenant 1804 and staff-captain in 1805. As a subaltern he had become one of
Scharnhorst's intimates, and he was distinguished for his energetic and fearless character before the war of 1806, in which he served throughout, from Jena to the peace of Tilsit, as a staff officer, and won the rank of major for distinguished service in action. After the peace, and the downfall of Prussia, he was one of the most active of Scharnhorst's assistants in the work of reorganization (1809), joined the tugendbund and endeavoured to take part in Schill's abortive expedition, after which he entered the Austrian service as a major on the general staff. Thenceforth he journeyed to Cadiz to assist the Spaniards against Napoleon, and he led a corps of volunteers in the defence of that port against Marshal Victor in 1810. He was present at the battle of Albuera, at Saguntum, and at Valencia, becoming a prisoner of war at the surrender of the last-named place. Soon, however, he escaped to Switzerland, whence early in 1813 he returned to Prussia as a major on the general staff. He served successively under Colonel von Dollfs and General von Kleist, and as commissioner at the headquarters of the Russian general Barclay de Tolly. He took part with Kleist in the victory of Kulm, and recovered from a severe wound received at that action in time to be present at the battle of Leipzig. He played a conspicuous part in the campaign of 1814 in France, after which he was made a major-general. In this rank he was appointed quartermaster-general to Field Marshal Prince Blücher, and, after his chief and Gneisenau, Grolmann had the greatest share in directing the Prussian operations of 1815. In the decision, on the 18th of June 1815, to press forward to Wellington's assistance (see Waterloo Campaign), Grolmann actively concurred, and as the troops approached the battle-field, he is said to have overcome the momentary hesitation of the commander-in-chief and the chief of staff by himself giving the order to advance. After the peace of 1815, Grolmann occupied important positions in the ministry of war and the general staff. His last public services were rendered in Poland as commander-in-chief, and practically as civil administrator of the province of Posen. He was promoted general of infantry in 1837 and died on the 1st of June 1843, at Posen. His two sons became generals in the Prussian army. The Prussian 18th regiment bears his name.

General von Grolmann supervised and provided much of the material for Von Damitz's Gesch. des Feldugs 1815 (Berlin, 1837–1838), and Gesch. des Feldugs 1814 in Frankreich (Berlin, 1842–1843).

Grommatici (from grama or gruma, a surveyor's pole), or Agrimensorum, the name for land-surveyors amongst the Romans. The art of surveying was probably at first in the hands of the soldiers, and is said to have been exercised on the elevation of a templum (any consecrated space) was necessary. Thus, the boundaries of Rome itself, of colonies and camps, were all marked out in accordance with the rules of augural procedure. The first professional surveyor mentioned is L. Decidius Saxa, who was employed by Antony in the measurement of camps (Cicero, Philippiques, xi, 12, xiv, 10). During the empire their number and reputation increased. The distribution of land amongst the veterans, the increase in the number of military colonies, the settlement of Italian peasants in the provinces, the general survey of the empire under Augustus, the separation of private and state domains, led to the establishment of a recognized professional corporation of surveyors. During later times they were in receipt of large salaries, and in some cases were even honoured with the title clarissimus. Their duties were not merely geometrical or mathematical, but required legal knowledge for consultations or the settlement of disputes. This led to the institution of special schools for the training of surveyors and a special literature, which lasted from the 1st to the 6th century A.D. The earliest of the gromatic writers was Frontinus (q.v.), whose De agrorum qualitate, dealing with the legal aspect of the art, was the subject of a commentary by Aggenus Urbicus, a Christian schoolmaster. Under Trajan a certain Balbus, who had accompanied the emperor on his Dacian campaign, wrote a still extant manual of geometry for land surveyors (Expositio et ratio omnium formarum or mensurarum, probably after a Greek original by Hero), dedicated to a certain Celsus who had invented an improvement in a gromatic instrument (perhaps the dioptra, resembling the modern theodolite); for the treatises of Hyginus see that name. Somewhat later than Trajan was Sicius Flaccus (De conditionibus agrorum, extant), while the most curious treatise on the subject, written in barbarous Latin and entitled Casae literarum (long a school textbook) is the work of a certain Innocentius (4th–5th century). It is doubtful whether Boethius is the author of the treatises attributed to him. The Grommatici veteres also contains extracts from official registers (probably belonging to the 5th century) of colonial and other land surveys, lists and descriptions of boundary stones, and extracts from the Theodosian Codex. According to Mommsen, the collection had its origin during the 5th century in the office of a vicarius (diocesan governor) of Rome, who had a number of surveyors under him. The surveyors were known by various names: decem pedator (with reference to the instrument used); finitor, metator or mensur castrorum in republican times; logatus Augustorum as imperial civil officials; professor, auctor as professional instructors.

The best edition of the Gromatici is by C. Lachmann and others (1848) with supplementary volume, Die Schriften der römischen Feldmesser (1852); see also B. G. Niebuhr, Roman History, ii., Berlin 1827, Eng. translation New York 1853. M. Cantor, Die römischen Agrimensorum (Leipzig, 1875); P. de Tissot, La Condition des Agrimensorum dans l'ancienne Rome (1879); G. Rossi, Groma e spadaro (Turin, 1877); articles in Ersch and Gruber's Allg. Encyclopädie, and by G. Humbert in Darenberg and Saglio's Dictionnaire des antiquités; Teufel-Schwebke, Hist. of Roman Literature, 58.

Groningen, the most northerly province of Holland, bounded S. by Drente, W. by Friesland and the Lauwers Zee, N. and N.E. by the North Sea and the mouth of the Ems with the Dollart, and on the S.E. by the Prussian province of Hanover. It includes the islands of Boschplaat and Rottumeroog, belonging to the group of Frisian islands (q.v.). Area, 887 sq. m.; pop. (1900) 599,602. Groningen is connected with the Drente plateau by the sandy tongue of the Hondsrug which extends almost up to the capital. West, north and north-east of this the province is flat and consists of sea-clay or sand and clay mixed, except where patches of low and high fen occur on the Frisian borders. Low fen predominates to the east of the capital, between the Zuidlardermeer and the Schildmeer or lakes. The south-eastern portion of the province consists of high fen resting on diluvial sand. A large part of this has been reclaimed and the sandy soil laid bare, but on the Drente and Prussian borders areas of fen still remain. The Groninger border was long considered as the natural protection of the eastern frontier, and with the view of preserving its impassable condition neither agriculture nor cattle-rearing might be practised here until 1824, and it was only in 1868 that the building of houses was sanctioned and the work of reclamation begun. The gradual extension of the seaward boundaries of the province owing to the process of littoral deposits may be easily traced, a triple line of sea-dikes in places marking the successive stages in this advance. The rivers of Groningen descending from the Drentse plateau meet at the capital, whence they are continued by the Reitdiep to the Lauwers Zee (being discharged through a lock), and by the Ems canal (1876) to Delzyl. The south-eastern corner of the province is traversed by the Westerwold Aa, which discharges into the Dollart. The railway system belongs to the northern section of the State railways, and affords communication with Germany via Winschoten. Steam-tramways also serve many parts of the province. Agriculture is the main industry. The proportion of landowners is a very large one, and the prosperous condition of the Groninger farmer is attested by the style of his home, his dress and his gig. As a result, however, partly of the usual want of work on the grasslands in certain seasons, there has been a considerable emigration to America. The ancient custom called the beklem-recht, or
lease-right, doubtless accounts for the extended ownership of the land. By this law a tenant-farmer is able to bequeath his farm, that is to say, he holds his lease in perpetuity.

The chief agricultural products are barley, oats, wheat, and in the north-east flax is also grown, and exported to South Holland and Belgium. On the higher clay grounds cattle-rearing and arable farming from 1427, and an organ constructed by Butter and cheese making. The cultivation of potatoes on the sandgrounds in the south and the fen colonies along the Stads-Canal invite general comparison with the industries of Drente (q.v.). Hooge\-zand and Sappemeer, Veendam and Wildervank, New and Old Pekela, New and Old Stads-Canal are instances of villages which have extended until they overlap one another and are similar in this respect to the industrial villages of the Zaan Streek in North Holland. The coast fisheries are considerable. Groningen (g.e.) is the chief and only large town of the province. Delfzijl, which was formerly an important fortress for the protection of the ancient sluices on the little river Delf (hence its name), has greatly benefited by the construction of the Ems (Eem's) ship-\-canal connecting it with Groningen, and has a good harbour with a considerable import trade in wood. Appingedam and Winschoten are very old towns, having important cattle and horse markets. The pretty wood at Winschoten was laid out by the Society for Public Welfare (Tot Nui van hei Algemeen) in 1826.

**GRONINGEN.** A town of Holland, capital of the province of the same name, at the confluence of the two canalized rivers, the Drentsche Aa and the Hunse (which are continued to the Lauwers Zee as the Reit Diep), 16 m. N. of Assen and 33 m. E. of Leeuwarden by rail. Pop. (1900) 67,553. Groningen is the centre from which several important canals radiate. Besides the Reit Diep, there are the Ems Canal and the Damster Diep, connecting it with Delfzijl and the Dollart, the Kolenol's Diep with Leeuwarden, the Nord Willem's Canal with Assen and the south and the Stads-Canal south-east with the Ems. Hence steamers ply in all directions, and there is a regular service to Emden and the Island of Borkum via Delfzijl, and via the Lauwers Zee to the island of Schiermonnikoog. Groningen is the most important town in the north of Holland, with its fine shops and houses and wide clean streets, while brick houses of the 16th and 17th centuries help it to retain a certain old-world air. The ancient part of the town is still surrounded by the former moat, and in the centre lies a group of open places, of which the Groote Markt is one of the largest market-squares in Holland. Pleasant gardens and promenades extend on the north side of the town, together with a botanical garden. The chief church is the Martini-kerk, with a high tower (432 ft.) dominating the town. Other churches include the St. Catharina's (rebuilt), the Marktkerk (rebuilt), the provincial museum of antiquities, containing interesting Germanic antiquities, as well as medieval and modern collections of porcelain, pictures, &c.; the courts of justice (transformed in the middle of the 18th century); the old Ommelanderhuis, formerly devoted to the administration of the surrounding district, built in 1509 and restored in 1809; the weigh-house (1874); the civil and military prison; the arsenal; the military hospital; and the concert hall.

The university of Groningen, founded in 1614, received its present fine buildings in classical style in 1830-33. Among its auxiliary establishments are a good natural history museum, an observatory, a laboratory, and a library which contains a copy of Erasmus' New Testament with marginal annotations by Luther. Other educational institutions are the deaf and dumb institution founded by Henri Daniel Guyot (d. 1828) in 1790, a gymnasium, and schools of navigation, art and music.

There are learned societies for the study of law (1761) and natural science (1830); an academy of fine arts (1830); an archaeological society; and a central bureau for collecting information concerning the province.

As far back as the 14th century work has been done on account of the advantages of its natural position, Groningen maintains a very considerable trade, chiefly in oil-seed, grain, wood, turf and cattle, with Great Britain, Germany, Scandinavia and Russia. The chief industries are flax-spinning, rope-making, sugar refining, book printing, wool combing and dyeing, and it also manufactures beer, tobacco and cigars, cotton and woollen stuffs, furniture, organs and pianos; besides which there are saw, oil and grain mills, machine works, and numerous goldsmiths and silversmiths.

**History.**—The town of Groningen belonged originally to the pagus, or guern, of Triantia (Drenthe), the bishopric of which was bestowed by the emperor Henry II. on the bishop and chapter of Utrecht in 1024. In 1040 Henry III. gave the church of Utrecht the royal domain of Groningen, and in the deed of gift the "villa Croninge" is mentioned. Upon this charter the bishops of Utrecht based their claim to the overlordship of the town, a claim which the citizens hotly disputed. At the time of the donation, indeed, the town can hardly be said to have existed, but the royal "villa" rapidly developed into a community which strove to assert the rights of a free imperial city. At first the bishops were too strong for the town, and in the defences built in 1130 were pulled down by the bishop's order two years later; and during the 12th and 13th centuries the see of Utrecht, in spite of frequent revolts, succeeded in maintaining its authority. Down to the 14th century an episcopal prefec, or burggrave, had his seat in the city, his authority extending over the neighbouring districts known as the Greet. In 1143 Heribert of Blerum, bishop of Utrecht, converted the office into an hereditary fief in favour of his brother Liffert, on the extinction of whose male line it was partitioned between the families of Koovorden (or Coevorden) and van den Hove. Gradually, however, the burgv Elk, aided by the neighbouring Frisians, succeeded in freeing themselves from the episcopal yoke. The city was again walled in 1255; before 1284 it had become a member of the Hanseatic league; and by the end of the 14th century it was practically a powerful independent republic, which exercised an effective control over the Frisian Ommelande between the Ems and the Lauwers Zee. At the close of the 14th century the heirs of the Koovorden and van den Hove families sold their rights, first to the town, and then to the bishop. A struggle followed, in which the city was temporarily vanquished in 1411; but his nominated archbishop, and his followers, continued to exercise jurisdiction, but members of the town sat on the bench with him, and an appeal lay from his court to the Raad itself. The council was, in fact, supreme in the city, and not in the city only. In 1430 it decreed that no one might trade in all the district between the Ems and the Lauwers Zee except burghe, and those who had purchased the burnewal (right of residence in the city) and the freedom of the gilds. Maximilian I. assigned Groningen to Albert of Saxony, hereditary podestat of Friesland, but the citizens refused to accept the protection of the bishop of Utrecht; and when Albert's son George attempted in 1505 to seize the town, they recognized the lordship of Edzard of East Friesia. On George's renewal of hostilities they transferred their allegiance to Duke Charles of Gelderland, in 1515. In 1536 the city passed into the
hands of Charles V., and in the great wars of the 16th century suffered all the miseries of siege and military occupation. From 1581 onwards, Groningen still held by the Spaniards, was con-
antly under the "Orangemännchen" which had declared against
the king of Spain. This feud continued, in spite of the capture
of the city in 1594 by Maurice of Nassau, and of a decree
of the States in 1597 which was intended to set them at rest.
In 1672 the town was besieged by the bishop of Münster, but it
was successfully defended, and in 1698 its fortifications were
improved under Coehoorn's direction. The French Republics
planted their tree of liberty in the Great Market on the 14th of
February 1795, and they continued in authority till the 16th
of November 1814. The fortifications of the city were doomed
to destruction by the law of the 14th of April 1874.

d'histoire, iii. 496 (Leiden, 1890-1892); also s.v. in Chevalier, Répertoire
des sources hist. du moyen âge (Topo-bibliographie).

Gronlund, LaurencE (1846-1899), American socialist, was
born in Copenhagen, Denmark, on the 13th of July 1846. He
graduated from the university of Copenhagen in 1865, began
the study of law, removed to the United States in 1867, taught
German in Milwaukee, was admitted to the bar in 1869, and
practised in Chicago. He became a writer and lecturer on social
questions, and was closely connected with the work done at the
Labour party from 1874 to 1884, then devoted himself almost ex-
clusively to lecturing until his appointment to a post in the bureau
of labour statistics. He again returned to the lecture
field, and was an editorial writer for the New York and Chicago
American from 1898 until his death in New York City on the
15th of October 1899. His principal works are: The Coming
Revolution (1880); The Co-operative Commonwealth in its Outlines,
An Exposition of Modern Socialism (1884); Co Ira, or Danton
in the French Revolution (1888), a rehabilitation of Danton;
Our Destiny, The Influence of Socialism on Morals and Religion
(1890); and The New Economy (1898).

Grönovius (the latinized form of Grönov), Johann FriedricH (1611-1671), German classical scholar and critic,
was born at Hamburg on the 8th of September 1611. Having
studied at several universities, he travelled in England, France
and Italy. In 1643 he was appointed professor of rhetoric and
history at Deventer, and in 1658 to the Greek chair at Leiden,
where he died on the 28th of December 1671. (See also Fabretti,
Raphael.) Besides editing, with notes, Statius, Plautus, Livy,
Thucydides, Plutarchus, and Seneca, Grönovius was the author,
amongst numerous other works, of Commentariorum de sestertii (1643) and of an edition of Hugo Grotius' De jure
belli et pacis (1660). His Observationes contain a number of
brilliant emendations. His son, Jakob Grönovius (1645-1717),
is chiefly known as the editor of the Theaurus antiquitatum
Graecarum (1677-1702, in 13 volumes).

See J. E. Sambys, Hist. of Class. Schol. ii. (1908); F. A. Eckstein
in Erich and Gruber's Allgemeine Encyclopädie.

Groom, in modern usage a male servant attached to the
stables, whose duties are to attend to the cleaning, feeding,
currying and care generally of horses. The earliest meaning
of the word appears to be that of a boy, and in 16th and 17th
century literature it frequently occurs, in pastorels, for a shepherd
lover. Later it is used for any male attendant and, thus survives
in the name for several officials in the royal household, such as the
grooms-in-waiting, and the grooms of the great chamber.
The groom-porter, whose office was abolished by George III.,
saw to the preparation of the sovereign's apartment, and, during the
16th and 17th centuries, provided cards and dice for playing, and
was the authority to whom were submitted all questions of
gaming within the court. The origin of the word is obscure. The
O. Fr. gromet, shop boy, is taken by French etymologists to be
derived from the English. From the application of this
word to a wine-taster in a wine merchant's shop, is derived
gourmet, an epicure. According to the New English Dictionary,
though there are no instances of groom in other Teutonic
languages, the word may be ultimately connected with the root of
"to grow." In "bridegroom," a newly married man,
"grom" in the 16th century took the place of an older gome,
common old Teutonic word meaning "man," and connected
with the Latin homo. The Old English word was brydgyman,
later bridgegome. The word survives in the German Bräutigam.

Groot, GerHarD (1340-1384), otherwise Gerrit or Geert Groot,
in Latin Gerardus Magnus, a preacher and founder of the society of Brothers of Common Life (g.v.), was born in 1340
at Deventer in the diocese of Utrecht, where his father held a
good civic position. He went to the university of Paris when
only fifteen. Here he studied scholastic philosophy and theology
under a pupil of Occam's, from whom he imbibed the nominalist
conception of philosophy; in addition he studied canon law,
and the works of St. Thomas Aquinas, and the works of the
Hebrew. After a brilliant course he graduated in 1358, and
possibly became master in 1359. He pursued his studies still
further in Cologne, and perhaps in Prague. In 1366 he visited
the papal court at Avignon. About this time he was appointed
to a canonry in Utrecht and to another in Aix-la-Chapelle,
and the life of the brilliant young scholar was rapidly becoming
luxurious, secular and selfish, when a great spiritual change
passed over him which resulted in a final renunciation of every
worldly enjoyment. This conversion, which took place in 1374,
and was due only perhaps to his own spiritual illness and partly
to the influence of Henry de Calcar, the learned and pious
prior of the Carthusian monastery at Munnikhuizen near Arnhem, who had remonstrated with him on the vanity
of his life. About 1376 Gerhard retired to this monastery
and there spent three years in meditation, prayer and study, without,
however, becoming a Carthusian. In 1379, having received
ordination as a deacon, he became missionary preacher through-
out the diocese of Utrecht. The success which followed his
labours not only in the town of Utrecht, but also in Zwolle,
Deventer, Kampen, Amsterdam, Haarlem, Gouda, Leiden,
Delft, Züphen and elsewhere, was immense; according to
Thomas à Kempis the people left their business and their meals
to hear his sermons, so that the churches could not hold the
crowds that flocked together wherever he came. The bishop
of Utrecht supported him warmly, and got him to preach against
concubinage in the presence of the clergy assembled in synod.
The impartiality of his censures, which he directed not only
against the prevailing sins of the laity, but also against heresy,
simony, avarice, and impurity among the secular and regular
clergy, proved the destroyers of the laity in the diocese of
Utrecht were brought against him. It was in vain that
Groot emitted a Publica Protestatio, in which he declared
that Jesus Christ was the great subject of his discourses, that in all
of them he believed himself to be in harmony with Catholic
discipline, and that he willingly subjected them to the candid
judgment of the Roman Church. The bishop was induced to
issue an edict which prohibited from preaching all who were not
in priest's orders, and an appeal to Urban VI. was without effect.
There is a difficulty as to the date of this prohibition; either it
was only a few months before Groot's death, or else it must have
been removed by the bishop, for Groot seems to have preached
in public in the last year of his life. At some period (perhaps
1381, perhaps earlier) he paid a visit of some days' duration
to the famous mystic Johann Ruyssbroek, prior of the
Augustinian canons at Gronendael near Brussels; at this visit
he formed Groot's attraction for the rule and life of the Augustin-
ian canons which was destined to bear such notable fruit.
At the close of his life he was asked by some of the clerics who
attached themselves to him to form them into a religious order,
and Groot resolved that they should be canons regular of St. Augustine.
No time was lost in the effort to carry out the project,
but Groot died before a foundation could be made. In 1387,
however, a site was secured at Windesheim, some 20 m. north
of Deventer, and here was established the monastery that became
the cradle of the Windesheim congregation of canons regular,
embracing in course of time nearly one hundred houses, and
leading the way in the series of reforms undertaken during the
15th century by all the religious orders in Germany. The
initiation of this movement was the great achievement of Groot's
life; he lived to preside over the birth and first days of his other creation, the society of Brothers of Common Life. He died of the plague at Deventer in 1384, at the age of 44.

The chief authority for Gros's life is Thomas à Kempis, Vita Gerardii Magni (translated into English by J. P. Arthur, The Founders of the New Devotion, 1905); also the Chronicon Windesheimense of 1497, which, though a contemporary document, based on ecclesiastical sources, will be found in S. Kettellwey, Thomas à Kempis and the Brothers of Common Life (1882), i.e. 5; and a shorter account in F. R. Cruise, Thomas à Kempis, 1887, p. 46. An excellent sketch, which was based on the writings, is given by L. Schulze in Herzog-Hauck, Realencyclopadie (ed. 3); he insists on the fact that Gros's theological and ecclesiastical ideas were those commonly current in his day, and that the attempts made to make him "a reformer of the Reformation" are unhistorical.

**GROOVE-TOOTHED SQUIRREL—GROSART**

The grooved-toothed squirrel, *Rhithriscolus macrotis*, representing a genus by itself distinguished from all other members of the family *Sciuridae* by having numerous longitudinal grooves on the front surface of the incisor teeth; the molar being of a simpler type than in other members of the family. The tail is long and fox-like, and the ears are tufted and the flanks marked by black and white. The specimen described by Mr. GROS, at the London Zoological Society, in 1835, was found on the shores of the Seine near Sèvres. From a work which he had placed in his hat it was known that "lais de la vie, et trahi par les dernières facultés qui lui rendaient supportable, il avait resolu de s'en défaire." The number of Gros's pupils was very great, and was considerably augmented when, in 1815, David quitted Paris and made over his own classes to him. Gros was decorated and named baron of the empire by Napoleon, after the Salon of 1808, at which his "Battle of Aboukir" was exhibited. While in the French army, he became a member of the Institute, professor at the Ecole des Beaux Arts, and was named chevalier of the order of St. Michel.

M. Delcêluz gives a brief notice of his life in Louis David et son temps, and Julius Meyer's Geschichte der modernen französischen Malerei contains an excellent criticism on his works.

**GROSART, ALEXANDER BALLOCH** (1827-1899), Scottish divine and literary editor, the son of a building contractor, was born at Stirling on the 18th of June 1827. He was educated at Edinburgh University, and in 1856 became a Presbyterian minister at Kinross. In 1865 he went to Liverpool, and three years later to Blackburn. He resigned from the ministry in 1892, and died at Dublin on the 16th of March 1899. Dr Grosart is chiefly remembered for his exertions in reprinting much rare Elizabethan literature, a work which he undertook in the first instance from his strong interest in Puritan theology. Among the first writers whose works he edited were the Puritan divines, Richard Sibbes, Thomas Brooks and Herbert Palmer. Editions of Michael Bruce's *Poems* (1665) and Richard Gilpin's *Demonologia sacra* (1857) followed. In 1868 he brought out a bibliography of the writings of Richard Baxter, and from that year until 1876 he was occupied in reproducing for private subscribers the "Fuller Worthies Library," a series of thirty-nine volumes which included the works of Thomas Fuller, Sir John Davies, Fulke Greville, Henry Vaughan, Andrew Marvell, George Herbert, Richard Crashaw, John Donne and Sir Philip Sidney. The last four volumes of the series were devoted to the works of many little known and otherwise inaccessible authors. His *Occasional Issues of Unique and Very Rare Books* (1875-1881) is of the utmost interest to the book-lover. It included among other things the *Annals Dubrensis* of Robert Dover. In 1876 still another series, known as the "Chertsey Worthies Library," was begun. It included editions of the works of Nicholas Breton, Francis Quarles, Dr Joseph Beaumont, Abraham Cowley, Henry More and John Davies of Hereford. Grosart was uniriting in his enthusiasm and energy for this kind of work. The two last-named series were being produced simultaneously until 1881, and no sooner had they been completed than Grosart began the "Huth Library," so called from the bibliophile Henry Huth, who possessed the originals of many of the reprints. It included the works of Robert Greene, Thomas Nash, Gabriel Harvey, and the prose tracts of Thomas Dekker. He also edited the complete works of Edmund Spenser and Samuel Daniel. From the Townerly Hall collection he reprinted several MSS, and edited Sir John Eliot's works, Sir Richard Boyle's *Lismore Papers*, and various publications for the Chetham Society, the Camden Society and the Roxburghe Club. Dr Grosart's faults of style and occasional inaccuracy do not seriously detract from the immense value of his work. He was unwearied in searching for rare books, and he brought to light much interesting literature, formerly almost inaccessible.
The species of the Old World which, though commonly called "grosbeaks," certainly belong to the family Fringillidae, are treated under Weaver-bird.

(Grosbeak, Fr. Grosbeak; a name very indefinitely applied to many birds belonging to the families Fringillidae and Ploceidae of modern ornithologists, and perhaps to some members of the Emberizidae and Tangaridae, but always to birds distinguished by the great size of their bill. Taken alone it is commonly a synonym of hawfinch (q.v.), but a prefix is usually added to indicate the species, as pine-grosbeak, cardinal-grosbeak and the like. By early writers the word was generally given as an equivalent of the Linnaean Loxia, but that genus has been found to include many forms not now placed in the same family.

The Pine-grosbeak (Pinicola enucleator) inhabits the conifer-zone of both the Old and the New Worlds, seeking, in Europe and probably elsewhere, a lower latitude as winter approaches—often journeying in large flocks; strangers have occasionally reached the British Islands (Darrell, Br. Birds, ed. 4, ii. 177-179). In structure and some of its habits much resembling a bullfinch, but much exceeding that bird in size, it has the plumage of a crossbill and appears to undergo the same changes as do the members of the restricted genus Loxia—the young being of a dull greenish-grey streaked with brownish-black, the adult hens tinged with golden-green, and the cocks glowing with crimson-red on nearly all the body-feathers, this last colour being replaced after moult in confinement by bright yellow. Nest of this species were found in 1821 by Johana Wilhelm Zetterstedt near Juckasjarvi in Swedish Lapland, but little was known concerning its nidification until 1855, when John Wölley, after two years' ineffectual search, succeeded in obtaining near the Finnish village Muonionisa, on the Swedish frontier, well-authenticated specimens with the eggs, both of which are like exaggerated bullfinches. The food of this species seems to consist of the seeds and buds of many sorts of trees, though the staple may very possibly be those of some kind of pine.

Allied to the pine-grosbeak are a number of species of smaller size, but its equals in beauty of plumage. They have been referred to several genera, such as Carpodacus, Proposer, Bycanetes, Uragus and others; but possibly Carpodacus is sufficient to contain all. Most of them are natives of the Old World, and chiefly of its eastern division, but several inhabit the western portion of North America, and one, C. githagonius (of which there seem to be at least two local races), is an especial native of the deserts, or their borders, of Arabia and North Africa, extending even to some of the Canary Islands—a singular modification in the habitat of a form which one would be apt to associate exclusively with forest trees, and especially conifers.

The cardinal grosbeak, or Virginian nightingale, Cardinalis virginianus, claims notice here, though doubt may be entertained as to the family to which it really belongs. It is no less remarkable for its bright coloring, its voice, its elongated crest of brilliant color, and its fine song. Its ready adaptation to confined habitation has made it a popular cage-bird on both sides of the Atlantic. The hen is not so good a songster as the cock bird. Her plumage, with exception of the wings and tail, which are of a dull red, is light-olive above and brownish-yellow beneath. This species inhabits the eastern parts of the United States southward of 40° N. lat., and also occurs in the Bermudas. It is represented in the south-west of North America by other forms that by some writers are deemed species, and in the northern parts of South America by the C. phoeniceus, which would really seem entitled to distinction. Another kindred bird placed from its short and broad bill in a different genus, and known as Pyrrholoxia sinuata or the Texan cardinal, is found on the southern borders of the United States and in Mexico; while among North American "grosbeaks" must also be named the birds belonging to the genera Geico and Hedymyia—the former especiallyistinguished by the beautiful blue G. caerulea, and the latter by the brilliant rose-breasted H. ludovicianus, which last extends its range into Canada.

1 Many of them are described and illustrated in the Monographie des voitures of Prince C. L. Bonaparte and Professor Schlegel (1859), though it excludes many birds which an English writer would call "grosbeaks."
and such figurative senses as coarse, vulgar or flagrant, the chief uses are whole, entire, without deduction, as opposed to "net," or as applied to that which is sold in bulk as opposed to "retail" (cf. "grocer" and "engrossing"). As a unit of tale, "gross" equals 12 dozen, 144, sometimes known as "small gross," in contrast with "great gross," i.e. 12 gross, 144 dozen. As a technical expression in English common law, "in gross" is applied to an incorporeal hereditament attached to the person of an owner, in distinction to one which is appendant or appurtenant, that is, attached to the ownership of land (see Commons).

**GROSE, JULIUS WALDEMAR** (1828–1903), German poet, the son of a military chaplain, was born at Erfurt on the 25th of April 1828. He received his early education at the gymnasion in Magdeburg, and on leaving school showing disinclination for the ministry, entered an architect's office. But his mind was bent upon literature, and in 1849 he entered the university of Halle, where, although inscribed as a student of law, he devoted himself almost exclusively to letters. His first poetical essay was with the tragedy Cola di Rienzi (1851), followed in the same year by a second, Nibelungenlied, on which work he was at once produced on the stage. The success of these first two pieces encouraged him to follow literature as a profession, and proceeding in 1852 to Munich, he joined the circle of young poets of whom Paul Heyse (q.v.) and Hermann Lingg (1820–1905) were the chief. For six years (1855–1861) he was dramatic critic of the Neue Münchener Zeitung, and was then for a while on the staff of the Leipziger Illustrirte Zeitung, but in 1862 he returned to Munich as editor of the Bayrische Zeitung, a post he retained until the paper ceased to exist in 1867. In 1869 Grose was appointed secretary of the Schiller-Stiftung, and lived for the next few years alternately in Weimar, Dresden, Munich, and, until, in 1890, he took up his permanent residence in Weimar. He was made grand-ducal Hofrat and had the title of "professor." He died at Torbole on the Lago di Garda on the 9th of May 1902.

Grose was a most prolific writer of novels, dramas and poems. As a lyric poet, especially in Gedichte (1857) and Aus bewegten Tagen, a volume of poems (1860), he showed himself more to advantage than in his novels, of which latter, however, Umtreu aus Milieu (2 vols., 1868); Vox populi, vox dei (1860); Maria Mancini (1871); Neue Erzählungen (1873); Sophie von Monnier (1876), and Ein Frauenlos (1888) are remarkable for a certain elegance of style. His tragedies, Die Junglinge (1858); Tiberius (1870); Johann von Schwaben; and the comedy Die steinerne Braut, had considerable success on the stage.

Grose's Gesammelte dramatische Werke appeared in 7 vols. in Leipzig (1883), while his Frederls Dichtungen and other works were published at Berlin (6 vols. 1871–1873). An edition of his selected works, under A. Bartels is in preparation. See also his autobiography, Literarische Ursachen und Wirkungen (1896); R. Prutz, Die Literatur der Gegenwart (1850); J. Eth, J. Grosse als epischer Dichter (1872).

**GROSSEHAIN,** a town in the kingdom of Saxony, 20 m. N. from Dresden, on the main line of railway (via Elsterwerda) to Berlin and at the junction of lines to Piestewitz and Frankfort-on-Oder. Pop. (1905) 12,015. It has an Evangelical church, a modern and a commercial school, a library and an extensive public park. The industries are very important, and embrace manufactures of woollen and cotton stuffs, buckskin, leather, glass and machinery. Grosshain was originally a Sorb settlement. It was for a time occupied by the Bohemians, by whom it was strongly fortified. It afterwards came into the possession of the margraves of Meissen, from whom it was taken in 1312 by the margraves of Brandenburg. It suffers considerably in all the great German wars, and in 1744 was nearly destroyed by fire. On the 16th of May 1813, a battle took place here between the French and the Russians.

See G. W. Schubert, Chronik der Stadt Grosshain (Grosshain, 1887–1892).

**GROSSETESTE, ROBERT** (c. 1175–1253), English statesman, theologian and bishop of Lincoln, was born of humble parents at Stradbrook in Suffolk. He received his education at Oxford where he became proficient in law, medicine and the natural sciences. Giraldus Cambrensis, whose acquaintance he had made, introduced him, before 1199, to William de Vere, bishop of Hereford. Grossestede aspired to a post in the bishop's household, but being deprived by death of this patron betook himself to the study of theology. It is possible that he visited Paris for this purpose, but he finally settled in Oxford as a teacher. His first preference of importance was the chancellorship of the university. He gained considerable distinction as a lecturer, and was the first rector of the school which the Franciscans established in Oxford about 1224. Grossestede's learning is highly praised by Roger Bacon, who was a severe critic. According to Froissart, Grossestede knew little Greek or Hebrew, and slight attention to the works of Aristotle, but was pre-eminent among his contemporaries for his knowledge of the natural sciences. Between 1214 and 1231 Grossestede held in succession the archdeaconries of Chester, Northampton and Leicester. In 1232, after a severe illness, he resigned all his benefices and prelatures except one prebend which he held at Lincoln. His intention was to spend the rest of his life in contemplative piety. But he retained the office of chancellor, and in 1235 accepted the bishopric of Lincoln. He undertook without delay the reformation of the medieval and clerical discipline throughout his vast diocese. This scheme brought him into conflict with more than one privileged corporation, but in particular with his own chapter, who vigorously disputed his claim to exercise the right of visitation over their community. The dispute raged hotly from 1239 to 1245. It was conducted on both sides with unseemly violence, and those who most approved of Grossestede's main purpose thought it needful to warn him against the mistake of over-zeal. But in 1245, by a personal visit to the papal court at Lyons, he secured a favourable verdict. In ecclesiastical polities the bishop belonged to the school of Bishop. His zeal for reform led him to advance, on behalf of the courts-Catholic, pretensions which it was impossible that the secular power should admit. He twice incurred a well-merited rebuke from Henry III. upon this subject; although it was left for Edward I. to settle the question of principle in favour of the state. The devotion of Grossestede to the hierarchical theories of his age is attested by his correspondence with his chapter and the king. Against the former he upheld the prerogative of the bishops; against the latter he asserted that it was impossible for a bishop to disregard the commands of the Holy See. Where the liberties of the national church came into conflict with the pretensions of Rome he stood by his own countrymen. Thus in 1238 he demanded that the king should release certain Oxford scholars who had assaulted the legate Otho. But at least up to the year 1247 he submitted patiently to papal encroachments, contenting himself with the protection (by a special papal privilege) of his own diocese from alien clerks. Of royal exactions he was more impatient; and after the retirement of Archbishop Saint Edmund (q.v.) constituted himself the spokesman of the clerical estate in the Great Council. In 1244 he sat on a committee which was empanelled to consider a demand for a subsidy. The committee rejected the demand, and Grossestede foiled an attempt on the king's part to separate the clergy from the baronage. "It is written," the bishop said, "that united we stand and divided we fall."

It was, however, soon made clear that the king and pope were in alliance to crush the independence of the English clergy; and from 1250 onwards Grossestede openly criticized the new financial expedients to which Innocent IV. had been driven by his desperate conflict with the Empire. In the course of a visit which he made to Innocent the same year, the bishop laid before the pope and cardinals a written memorial in which he ascribed all the evils of the Church to the malignant influence of the Curia. It produced no effect, although the cardinals felt that Grossestede was too influential to be punished for his audacity. Much discouraged by his failure the bishop thought of resigning. In the end, however, he decided to continue the unequal struggle. In 1257 he protested against a papal mandate enjoining the English clergy to pay Henry III. one-tenth of their revenues for a crusade; and called attention to the fact that, under the system of provisions, a sum of 70,000 marks was annually drawn.
from England by the alien nominees of Rome. In 1253, upon being commanded to provide in his own diocese for a papal nephew, he wrote a letter of expostulation and refusal, not to the pope himself but to the commissioner, Master Innocent, through whom he received the mandate. The text of the remonstrance, as given in the *Burton Annals* and in Matthew Paris, has possibly been altered by a forger who had less respect than Grosseteste had for the papacy. The language is more violent than that which the bishop elsewhere employs. But the general argument, that the papacy may command obedience only so far as its commands are consonant with the teaching of Christ and the apostles, is only what should be expected from an ecclesiastical reformer of Grosseteste's time. There is much more reason for suspecting the letter addressed "to the nobles of England, the citizens of London, and the community of the whole realm," in which Grosseteste is represented as denouncing in unmeasured terms papal influence in all its branches. But even in this case allowance must be made for the difference between modern and medieval standards of decorum.

Grosseteste numbered among his most intimate friends the Franciscan teacher, Adam Marsh (q.v.). Through Adam he came into close relations with Simon de Montfort. From the Franciscan's letters it appears that the earl had studied a political tract by Grosseteste on the difference between a monarchy and a tyranny; and that he embraced with enthusiasm the bishop's projects of ecclesiastical reform. Their alliance began as early as 1258, when Grosseteste exerted himself in behalf of reconciliation between the king and the earl. But there is no reason to suppose that the political ideas of Montfort had matured before the death of Grosseteste; nor did Grosseteste busy himself overmuch with secular politics, except in so far as they touched the interest of the Church. Grosseteste realized that the misrule of Henry III. and his unprincipled compact with the papacy largely accounted for the degeneracy of the English hierarchy and the laxity of ecclesiastical discipline. But he can hardly be termed a constitutionalist.

Grosseteste died on the 5th of October 1253. He must then have been between seventy and eighty years of age. He was already an elderly man, with a firmly established reputation, when he became a bishop. As an ecclesiastical statesman he showed the same fiery zeal and versatility of which he had given proof in his academical career; but the general tendency of modern writers has been to exaggerate his political and ecclesiastical services, and to neglect his performances as a scientist and scholar. The opinion of his own age, as expressed by Matthew Paris and Roger Bacon, was very different. His contemporaries, who admired the excellence of his intentions and the steadfastness of his principles, have left less stress upon his defects of temper and discretion. But they see in him the pioneer of a literary and scientific movement; not merely a great ecclesiast who patronized learning in his leisure hours, but the first mathematician and physicist of his age. It is certainly true that he anticipated, in these fields of thought, some of the most striking ideas to which Roger Bacon subsequently gave a wider currency.

See the *Epistolae Roberti Grosseteste* (Rolls Series, 1861) edited with a valuable introduction by H. R. Luard. Grosseteste's famous memorial to the pope is printed in the appendix to E. Brown's *Passculus rerum expetendarum et fugiendarum* (1660). A tract *De phisica, linea, angulis et figuris* was printed at Nuremberg in 1503. A French poem, *La Chastel d'amour*, sometimes attributed to him, has been printed by the Caxton Society. Two curious tracts, the "De moribus qui ad menam," (printed by Wynkyn de Worde) and the "Statuta familiae Roberti Grosseteste" (printed by J. S. Brewer in *Monumenta Franciscana*, i. 828), may be from his pen; but the editor of the latter work ascribes it to Adam de Marsh. There is less doubt respecting the *Reales Sciret Roberti*, a tract giving advice for the management of vineyards and of the land of Lincoln. For Grosseteste's life and work see Roger Bacon's *Opus majus* (ed. J. H. Bridges, 1897, 2 vols.) and *Opera quaedam inedita* (ed. J. S. Brewer, 1897, 3 vols.); and also *Chronica majora* (ed. H. R. Luard, Rolls Series, 1872-1881, 3 vols.); and *Annales* by S. Pegge (1793) and F. S. Stevenson (1899). (H. W. C. D.)

**GROSSETO**, a town and episcopal see of Tuscany, capital of the province of Grosseto, 90 m. S.S.E. of Pisa by rail. Pop. (1901) 5856 (town), 8843 (commune). It is 38 ft. above sea-level, and is almost circular in shape; it is surrounded by fortifications, constructed by Francis I. (1574-1587) and Ferdinand I. (1587-1609), which form a hexagonal enceinte with projecting bastions, with two gates only. The small cathedral, begun in 1204, is built of red and white marble alternating, in the Italian Gothic style; it was restored in 1855. The citadel was built in 1131 by Salimene. Grosseto is on the main line from Florence to Rome, and is also the starting-point (Montepescali, 8 m. to the N., is the exact point of divergence) of a branch line to Asciano and Siena.

The town dates from the middle ages. In 1138 the episcopal see was transferred thither from Russellae. In 1230 it, with the rest of the Maremma, of which it is the capital, came under the dominion of Siena. By the peace of 1559, however, it passed to Cosimo I. of Tuscany. In 1745 the malaria had grown to such an extent, owing to the neglect of the drainage works, that Grosseto had only 648 inhabitants, though in 1224 it had 3000 men who bore arms. Leopold I. renewed drainage operations, and by 1836 the population had risen to 2392. The malaria is not yet entirely conquered, however, and the official headquarters of the province are in summer transferred to Scansano (1837 ft.), 20 m. to the S.E. by road.

**GROSSI, GIOVANNI FRANCESCO** (?-1699), one of the greatest Italian singers of the age of *bel canto*, better known as Siface, was born at Pesca in Tuscany about the middle of the 17th century. He entered the papal chapel in 1675, and later sang at Vienna. Grosseto is on the main line from Siface from his impersonation of that character in an opera of Cavalli. It has generally been said that he appeared as Siface in Alessandro Scarlatti's *Mitridate*, but the confusion is due to his having sung the part of Mitridate in Scarlatti's *Pompeo* at Naples in 1683. In 1687 he was sent to London by the duke of Modena, to become a member of the chapel of James II. He probably did much for the introduction of Italian music into England, but soon left the country on account of the climate. Among Purcell's harpsichord music is an air entitled "Seafachi's Farewell." He was murdered in 1699 on the road between Bologna and Ferrara, probably by the agents of a nobleman with whose wife he had a liaison.

See Corrado Ricci's *Vita Barocca* (Milan, 1904).

**GROSSI, TOMMASO** (1751-1853), Lombard poet and novelist, was born at Bellano, on the Lake of Como, on the 20th of January 1791. He took his degree in law at Pavía in 1810, and proceeded thence to Milan to exercise his profession; but the Austrian government, suspecting his loyalty, interfered with his prospects, and in consequence Grossi was a simple notary all his life. That same year, at the age of 19, he was deposed and he soon showed by writing in the Milanese dialect the battle poem *La Priscia*, in which he described with vivid colours the tragic death of Prina, chief treasurer during the empire, whom the people of Milan, instigated by Austrian agitators, had torn to pieces and dragged through the streets of the town (1814). The poem, being anonymous, was first attributed to the celebrated Porta, but Grossi of his own accord acknowledged himself the author. In 1816 he published other two poems, written likewise in Milanese—*The Golden Rain* (La Figgia d'oro) and *The Fugitive* (La Fuggitiva). These compositions, set to music by C. M. di Böet and Manzoni, and the three poets came to form a sort of romantic literary triumvirate. Grossi took advantage of the popularity of his Milanese poems to try Italian verse, into which he sought to introduce the moving realism which had given such satisfaction in his earliest compositions; and in this he was entirely successful with his poem *Idegonda* (1814). He next wrote an epic poem, entitled *The Lombards in the First Crusade*, a work of which Manzoni makes honourable mention in *I Promessi Sposi*. This composition, which was published by subscription (1826), attained a success unequalled by that of any other Italian poem within the century. The example of Manzoni induced Grossi to write an historical novel entitled *Marco Visconti* (1834)—a work which contains passages of fine description and deep pathos. A little later Grossi published a tale in verse, *Ulrico and Lida*, but with this publication his poetical activity ceased.
After his marriage in 1838 he continued to employ himself as a notary in Milan till his death on the 10th of December 1853. His Life by Cantù appeared de Milan in 1854.

GROSMITH, GEORGE (1847– ), English comedian, was born on the 9th of December 1847, the son of a law reporter and entertainer of the same name. After some years of journalistic work he started about 1870 as a public entertainer, with songs and recitations; but in 1877 he began a long connexion with the Gilbert and Sullivan operas at the Savoy Theatre, London, in The Sorcerer. For twelve years he had the leading part, his capacity for "patter-songs," and his humorous acting, dancing and singing marking his creations of the chief characters in the Gilbert and Sullivan operas as the expression of a highly original individuality. In 1889 he left the Savoy, and again set up as an entertainer, visiting all the cities of Great Britain and the United States, but retiring in 1901. Among other books he wrote The Reminiscences of a Society Clown (1888); and, with his brother Weendon, The Diary of a Nobody (1894). His humorous songs and sketches numbered over six hundred. His younger brother, Weendon Grossmith, who was educated as a painter and attended at the Academy, also took to the stage, his first notable success being in the Pantomime Rehearsal; in 1894 he went into management on his own account, and had much success as a composer. George Grossmith, jun., and George Grossmith, jun., were both actors, the latter becoming a well-known figure in the musical comedies at the Gaiety Theatre, London.

GROS VENTRES (Fr. for "Great Bellies"), or ASENTA, a tribe of North American Indians of Algonquian stock. The name is said to have reference to the greediness of the people, but more probably originated from their prominent tattooing. They are settled at Fort Belknap agency, Montana. The name has also been given to other tribes, e.g. the Hidatsa or Minitari, now at Fort Berthold, North Dakota.

GROTE, GEORGE (1794–1871), English historian of Greece, was born on the 17th of November 1794, at Clay Hill near Beckenham in Kent. His grandfather, Andrews, originally a Bremen merchant, was one of the founders (1st of January 1766) of the banking-house of Grote, Prescott & Company in Threadneedle Street, London, the name of Grote which did not disappear from the firm till 1789. His father, also George, married (1793) Selina, daughter of Henry Peckwell (1747–1807), minister of the church at Huntingdon's chapel in Westminster (descended from the family of the celebrated de la Grange; see the Revolt on the revocation of the Edict of Nantes), and had one daughter and ten sons, of whom the historian was the eldest. Educated at first by his mother, George Grote was sent to the Sevenoaks grammar school (1800–1804) and afterwards to Charterhouse (1804–1810), where he studied under Dr Raine in company with Connope Thirlwall, George and Horace Waddington and Henry Havelock. In spite of Grote's school successes, his father refused to send him to the university and put him in the bank in 1810. He spent all his spare time in the study of classics, history, metaphysics and political economy, and in learning German, French and Italian. Driven by his mother's Puritanism and his father's contempt for academic learning to outside society, he became intimate with Charles Hay Cameron, who strengthened him in his love of philosophy, and George W. Norman, through whom he met his wife, Miss Harriet Lewin (see below). After various difficulties the marriage took place on the 7th of March 1820, and was in all respects a happy union.

In the meanwhile Grote had finally decided his philosophic and political attitude. In 1817 he came under the influence of Sir George Canning and James Mill, of Jeremy Bentham. He settled in 1820 in a house attached to the bank in Threadneedle Street, where his only child died a week after its birth. During Mrs Grote's slow convalescence at Hampstead, he wrote his first published work, the Statement of the Question of Parliamentary Reform (1821), in reply to Sir James Mackintosh's article in the Edinburgh Review, advocating popular representation, vote by ballot and short parliaments. In 1822 he published in the Morning Chronicle (April) a letter against Canning's attack on Lord John Russell, and edited, or rather re-wrote, some discursive papers of Bentham, which he published under the title Analysis of the Influence of Natural Religion on the Temporal Happiness of Mankind by Philip Beauchamp (1822). The book was published in the name of Richard Carlile, then in gaol at Dorchester. Though not a member of J. S. Mill's Utilitarian Society (1822–1832), he took a great interest in a society for reading and discussion, which met (from 1823) in a room at the bank before business hours twice a week. From the Posthumous Papers (pp. 22, 24) it is clear that Mrs Grote was wrong in asserting that she first in 1823 (autumn) suggested the History of Greece; the book was actually prepared in 1821, though what was then written was subsequently reconstructed. In 1826 Grote published in the Westminster Review (April) a criticism of Milford's History of Greece, which shows that his ideas were already in order. From 1826 to 1830 he was hard at work with J. S. Mill and Henry Brougham in the organization of the new "university" in Gower Street. He was a member of the council which organized the faculties and the curriculum; but in 1830, owing to a difference with Mill as to an appointment to one of the philosophical chairs, he resigned his position.

In 1831 he went abroad because of the political crisis, spent some months in Paris in the society of the Liberal leaders. Recalled by his father's death (6th of July), he not only became manager of the bank, but took a leading position among the city Radicals. In 1831 he published his important Essentials of Parliamentary Reform (an elaboration of his previous Statement), and, after refusing to stand as parliamentary candidate for the city in 1831, changed his mind and was elected head of the poll, with three other Liberals, in December 1832. After serving in three parliaments, he resigned in 1841, by which time his party ("the philosophical Radicals") had dwindled away. During these years of active public life, his interest in Greek history and philosophy had increased, and after a trip to Italy in 1842, he severed his connexion with the bank and devoted himself to literature. In 1846 the first two volumes of the History appeared, and the remaining ten between 1847 and the spring of 1856. In 1845 with Molesworth and Raikes Currie he gave monetary assistance to Auguste Comte (g.v.), then in financial difficulties. The formation of the Sonderbund (26th of July 1847) led him to visit Switzerland and study for himself a condition of things in some sense analogous to that of the ancient Greek states. Important papers resulted in the summer of 1847, in a series of weekly letters, collected in book form at the end of 1847 (see a letter to de Tocqueville in Mrs Grote's reprint of the Seven Letters, 1876).

In 1856 Grote began to prepare his works on Plato and Aristotle. Plato and the Other Compositions of Socrates (3 vols.) appeared in 1865, but the work on Aristotle he was not destined to complete. He had finished the Organon and was about to deal with the metaphysical and physical doctrines when he died on the 1st of June 1871, and was buried in Westminster Abbey. He was a man of strong character and self-control, unfailing courtesy and unswerving devotion to what he considered the best interests of the nation. To colleagues and subordinates alike, he was considerate and tolerant; he was unassuming, trustworthy in the smallest detail, accurate and comprehensive in thought, energetic and conscientious in action. Yet, hidden under his calm exterior there was a burning enthusiasm and a depth of passion of which only his intimate friends were aware. His work may best be considered under the following heads: 1. Grote's Services to Education.—He took, as already stated, an active part in the reform of the original university of London, which began its public work in Gower Street on the 28th of October 1828, and in 1836, on the incorporation of the university of London proper, became known as University College. In 1849 he was re-elected to the council, in 1860 he became treasurer, and on the death of Brougham (1868) president. He took a keen interest in all the work of the college, presented to it the Marmor Homericum, and finally bequeathed the reversion of £6000 for the endowment of a chair.
of philosophy of mind and logic. The enlumings of this sum were, however, to be held over and added to the principal if at any time the holder of the chair should be "a minister of the Church of England or of any other religious persuasion." In 1850 the senate of the university was reconstituted, and Grote was one of seven eminent men who were added to it. Eventually he became the strongest advocate for open examinations, for the claims not only of philosophy and classics but also of natural science, and, as vice-chancellor in 1862, for the admission of women to examinations. This latter reform was carried in 1863. He succeeded his friend Henry Hallam as a trustee of the British Museum in 1859, and took part in the reorganization of the departments of antiquities and natural science.

The honours which he received in recognition of these services were as follows: D.C.L. of Oxford (1853); LL.D. Cambridge (1861); F.R.S. (1857); honorary professor of ancient history in the Royal Academy (1859). By the French Academy of Moral and Political Sciences he was made correspondent (1857) and foreign associate (the first Englishman since Macaulay) (1864). In 1866 he refused Gladstone's offer of a peerage.

2. Political Career.—In politics Grote belonged to the "philosophic Radicals" of the school of J. S. Mill and Bentham, whose chief principles were representative government, vote by ballot, the abolition of a state church, frequent elections. He adhered to these principles throughout, and refused to countenance any reforms which were incompatible with them. By this uncompro,

mising attitude, he gradually lost all his supporters save a few men of like rigidity. As a speaker, he was clear, logical and impressive, and on select committees his common sense was most valuable. For his speeches see A. Bain in the Minor Works; see also Ballot.

3. The History of Greece.—It is on this work that Grote's reputation mainly rests. Though half a century has passed since its production, it is still in some sense the text-book. It consists of two parts, the "Legendary" and the "Historical" Greece. The former, owing to the development of comparative mythology, is now of little authority, and portions of part ii. are obsolete owing partly to the immense accumulations of epigraphic and archaeological research, partly to the subsequent discovery of the Aristotelian Constitution of Athens, and partly also to the more careful weighing of evidence which Grote himself misinterpreted. The interest of the work is twofold. In the first place it contains a wonderful mass of information carefully collected from all sources, arranged on a simple plan, and expressed in direct forcible language. It is in this respect one of the few great comprehensive histories in our possession, great in scope, conception and accomplishment. But more than this it is interesting as among the first works in which Greek history became a separate study, based on real evidence and governed by the criteria of modern historical science. Further Grote, a practical man, a rationalist and an enthusiast for democracy, was the first to consider Greek political development with a sympathetic interest (see Greece: History, Ancient, section "Authorities"), in opposition to the Tory attitude of John Gillies and Mitford, who had written under the influence of horror at the French Revolution. On the whole his work was done with impartiality, and more recent study has only confirmed his general conclusions. Much has been made of his defective accounts of the tyrants and the Macedonian empire, and his opinion that Greek history ceased to be interesting or instructive after Chaeromen. It is true that he confined his interest to the fortunes of the city state and neglected the wider diffusion of the Greek culture, but this is after all merely a criticism of the title of the book. The value of the History consists to-day primarily in its examination of the Athenian democracy, its growth and decline, an examination which is still the most inspiring, and in general the most instructive, in any language. In the description of battles and military operations generally Grote was handicapped by the lack of personal knowledge of the country. In this respect he seems like his predecessors Thucydides and C. C. Conolly.

4. In Philosophy Grote was a follower of the Mills and Bentham. J. S. Mill paid a tribute to him in the preface to the third edition of his Examination of Sir Wm. Hamilton's Philosophy, and there is no doubt that the empirical school owed a great deal to his sound, accurate thinking, untrammeled by any reverence for authority, technique and convention. In dealing with Plato he was handicapped by this very common sense, which prevented him from appreciating the theory of ideas in its widest relations. His Plato is important in that it emphasizes the generally neglected passages of Plato in which he seems to indulge in mere Socratic dialectic rather than to seek knowledge; it is, therefore, to be read as a corrective to the ordinary criticism of Plato. The more congenial study of Aristotle, though incomplete, is more valuable in the positive sense, and has not received the attention it deserves. Perhaps Grote's most distinctive contribution to the study of Greek philosophy is his chapter in the History of Greece on the Sophists, of whom he took a view somewhat more favourable than has been accepted before or since. His wife, Harriet Lewin (1792-1878), was the daughter of Thomas Lewin, a retired Indian civilUg, settled in Southampton. After her marriage with Grote in 1820 she devoted herself to the subjects in which he was interested and was a prominent figure in the literary, political and philosophical circle in which he lived. She carefully read the proofs of his work and relieved him of anxiety in connexion with his property. Among her writings are: Memoir of Ary Scheffer (1860); Collected Papers (1862); and her biography of her husband (1873). Another publication, The Philosophical Radicals of 1832 (privately circulated in 1866), is interesting for the light it throws on the Reform movement of 1832 to 1842, especially on Molesworth. Biographies.—The History of Greece passed through five editions the fifth (10 vols., 1888) being final. An edition covering the period from Solon to 403, with new notes and excursses, was published by J. M. Mitchell and M. O. B. Caspari in 1907. The Plato was finally edited by Alexander Bain in 4 vols. See Mrs Grote's Personal Life of George Grote, and article in Dict. Nat. Biog. by G. Croom Robertson. (J. M. M.)

GROTEFEND, GEORG FRIEDRICH (1775-1853), German epigraphist, was born at Münden in Hannover on the 9th of June 1775. He was educated partly in his native town, partly at Ilfeld, where he remained till 1795, when he entered the university of Göttingen, and there became the friend of Heyne, Tychsen and Heeren. Heyne's recommendation procured for him an assistant mastership in the Göttingen gymnasium in 1797. While there he published his work De pasigraphia sine scriptura universalis (1799), which led to his appointment in 1803 as proctor of the gymnasium of Frankfort-on-Main, and shortly afterwards as censor. Grotefend was best known during his lifetime as a Latin and Italian philologist, though the attention he paid to his own language is shown by his Anfangsgründe der deutschen Poesie, published in 1815, and his foundation of a society for investigating the German tongue in 1817. In 1821 he became director of the gymnasium at Hanover, a post which he retained till his retirement in 1849. In 1832-1842 appeared his revised edition of Wenck's Latin grammar, in two volumes, followed by a smaller grammar for the use of schools in 1826; in 1833-1838 a systematic attempt to explain the fragmentary remains of the Umbrian dialect, entitled Rudimenta linguae Umbrica ex inscriptionibus antiquis enodata (in eight parts); and in 1839 a work of similar character upon Eòcan (Rudimenta linguae Oscae). In the same year he published an important memoir on the coins of Bactria, under the name of Die Münzen der griechischen, parthischen, und indoislambischen Könige von Bactrien und den Ländern am Indus. He soon, however, returned to his favourite subject, and brought out a work in five parts, Zur Geographie und Geschichte von Alltalien (1840-1842). Previously, in 1836, he had written a preface to Wagenfeld's translation of the spurious Sanchoniathon of Phylbyblus, which was alleged to have been discovered in the preceding year in the Portuguese convent of Santa Maria de Merinhao. But it was in the East rather than in the West that Grotefend did his greatest work. The cuneiform inscriptions of Persia had for some time been attracting the attention of several German scholars, such as Grotefend's friend, Tychsen of Rostock, believed
GROTESQUE — GROTIUS

GROTH, PAUL HEINRICH VON (1843— ), German mineralogist, was born at Magdeburg on the 23rd of June 1843. He was educated at Freiberg, Dresden and Berlin, and took the degree of Ph.D. in 1868. After holding from 1872 the chair of mineralogy at Strasburg, he was in 1883 appointed professor of mineralogy and curator of minerals in the state museum at Mannheim. He carried on extensive researches on crystals and minerals, and also on art rocks; and published Zeittabrische Übersicht der einfachen Mineralien (1874—1898), and Physikalische Krystallographie (1876—1895, ed. 4, 1905). He edited for some years the Zeitschrift für Krystallographie und Mineralogie.

GROTIUS, HUGO (1583—1645), in his native country Huig van Groot, but known to the rest of Europe by the Latinized form of the name, Dutch publicist and statesman, was born at Delft on Easter day, the 10th of April 1583. The Groots were a branch of a family of distinction, which had been noble in France, but had removed to the Low Countries more than a century before. Their French name was de Cornets, and this cadet branch had taken the name of Groot on the marriage of Hugo's great-grandfather with a Dutch heiress. The father of Hugo was a lawyer in considerable practice, who had four times served the office of burgomaster of Leiden, and was one of the three curators of the university of that place.

In the annals of precocious genius there is no greater prodigy on record than Hugo Grotius, who was able to make good Latin verses at nine, was ripe for the university at twelve, and at fifteen composed his encyclopaedic work of Martianus Capella. At Leiden he was nominated by J. Tychsen to the chair of classics, and it was to engage his young friends in the editing of some classical texts. At fifteen Grotius accompanied Count Justin of Nassau, and the grand pensionary J. van Olden Barneveldt on their special embassy to the court of France. After a year spent in acquiring the language and making acquaintance with the leading men of France, Grotius returned home. He took the degree of doctor of law at Leiden, and entered on practice as an advocate.

Notwithstanding his successes in his profession, his inclination was to literature. In 1600 he edited the remains of Aratus with the versions of Cicero, Germanicus and Avienus. Of the Germanicus Scaliger says—"A better text than that which Grotius has given, it is impossible to give;" but it is probable that Scaliger had himself been the reviser. Grotius vied with the Latinists of his day in the composition of Latin verses. Some lines on the siege of Ostend spread his fame beyond the circle of the learned. He wrote three dramas in Latin: Christus païens; Sophomphanes, on the story of Joseph and his brethren; and Adamus exul, a production still remembered which was given at Leiden. The Sophomphaneus was translated into Dutch by Vondel, and into English by Francis Goldsmith (1652); the Christus païens into English by George Sandys (1640).

In 1604 the United Provinces, desiring to transmit to posterity some account of their struggle with Spain, determined to appoint a historiographer. The choice of the states fell upon Grotius, though he was but twenty years of age, and had not offered himself for the post. There was some talk at this time in Paris of calling Grotius to be librarian of the royal library. But it was not the desire of the Jesuits who wished to persuade the public that the opposition to the appointment of Isaac Casaubon did not proceed from theological motives, since they were ready to appoint a Protestant in the person of Grotius.

His next preterm was that of advocate-general of the fisc for the provinces of Holland and Zeeland. This was followed by his marriage, in 1608, to Marie Reigersberg, a lady of family in Zeeland, a woman of great capacity and noble disposition.

Grotius had already passed from occupation with the classics to studies more immediately connected with his profession. In the winter of 1615 he composed (but did not publish) a treatise entitled De jure praedae. The MS. remained unknown till 1688, when it was brought to light, and printed at the Hague under the auspices of Professor Fruin. It shows that the principles and the plan of the celebrated De jure belli, which was not composed
Grotius was trial, deputation Holland, stamped Grotius developed. There could be a distinction. The De jure praedae of 1604 there is much more than the germ of the later treatise De jure bellii. Its main principles, and the whole system of thought implied in the later, are anticipated in the earlier work. The arrangement even is the same. The chief difference between the two treatises is one which twenty years' experience in affairs could not bring—the substitution of more cautious and guarded language, less dogmatic affirmation, more allowance for exceptions and deviations. The Jus pacis was an addition introduced first in the later work, an insertion which is the cause of not a little of the confused arrangement which has been found fault with in the De jure bellii.

The De jure praedae further demonstrates that Grotius was originally determined to this subject, not by any speculative intellectual interest, but by a special occasion presented by his professional engagements. He was retained by the Dutch East India Company as their advocate. One of their agents, Hendrik de Heemskirk, had captured a rich Portuguese galleon in the Straits of Malacca. The right of a private company to make prizes was hotly contested in Holland, and denied by the stricter religionists, especially the Mennonites, who considered all war unlawful. Grotius undertook to prove that Heemskirk's prize had been lawfully captured. In doing this he was led to investigate the grounds of the lawfulness of war in general. Such was the usual origin of a book which long enjoyed such celebrity that it used to be said, with some exaggeration indeed, that it had founded a new science.

A short treatise which was printed in 1609, Grotius says without his permission, under the title of Mare liberum, is nothing more than a chapter—the 12th—of the De jure praedae. It was necessary to Grotius's defence of Heemskirk that he should show that the Portuguese pretence that Eastern waters were their private property was untenable. Grotius maintains that the ocean is free to all nations. The occasional character of this piece explains the fact that at the time of its appearance it made no sensation. It was not till many years afterwards that the jealousies between England and Holland gave importance and a novel doctrine broached in the tract by Grotius, a doctrine which Selden set himself to refute in his Mare clausum (1632).

Equally due to the circumstances of the time was the small contribution to constitutional history entitled De antiquitate reipublicae Batavorum (1610). In this he vindicates, on grounds of right, prescriptive and natural, the revolt of the United Provinces against the sovereignty of Spain.

Grotius, when he was only thirty, was made pensionary of the city of Rotterdam. In 1613 he formed one of a deputation to England, in an attempt to adjust those differences which gave rise afterwards to a naval struggle disastrous to Holland. He was received by James with every mark of distinction. He also cultivated the acquaintance of the Anglican ecclesiastics John Overall and L. Andrews, and was much in the society of the celebrated scholar Isaac Casaubon, with whom he had been in correspondence by letter for many years. Though the mediating views in the great religious conflict between Catholic and Protestant, by which Grotius was afterwards known, had been arrived at by him by independent reflection, yet it could not but be that he would be confirmed in them by finding in England a developed school of thought of the same character already in existence. How highly Casaubon esteemed Grotius appears from a letter of his to Daniel Heinsius, dated London, 13th of April 1613. "I cannot say how happy I esteem myself in having seen so much of one so truly great as Grotius. A wonderful man! This I knew him to be before I had seen him; but the rare excellence of that divine genius no one can sufficiently feel who does not see his face, and hear him speak. Proby is stamped on his features; his conversation savours of true piety and profound learning. It is not only upon me that he has made this impression, and the plausibility learned to whom he has been here introduced have felt the same towards him; the king especially so!"

After Grotius's return from England the exasperation of theological parties in Holland rose to such a pitch that it became clear that an appeal to force would be made. Grotius sought to find some mean term in which the two hostile parties of Remonstrants and Anti-remonstrants, or as they were subsequently called Arminians and Gomarists (see Remonstrants), might agree. A form of edict drawn by Grotius was published by the states, recommending mutual toleration, and forbidding ministers in the pulpit from handling the disputed dogmas.

To the orthodox Calvinists the word toleration was insupportable. They had the populace on their side. This fact determined the stadtholder, Maurice of Nassau, to support the orthodox party—a party to which he inclined the more readily that Olden Barneveldt, the grand pensionary, the man whose uprightness and abilities he most dreaded, sided with the Remonstrants.

In 1618 Prince Maurice set out on a sort of pacific campaign, disbanding the civic guards in the various cities of Gelders, and giving up the idea of the end of the war. He designed a coup d'état against the liberties of Utrecht and of Holland was carried out; the civic guard was disarmed—Grotius and his colleagues saving themselves by a precipitate flight. But it was only a reprieve. The grand pensionary, Olden Barneveldt, the leader of the Remonstrant party, Grotius and Hoogerbeets were arrested, brought to trial, and condemned—Olden Barneveldt to death, and Grotius to imprisonment for life and confiscation of his property. In June 1619 he was immersed in the fortress of Louvestein near Gorcum. His confinement was rigorous; but after a time his wife obtained permission to share his captivity, on the condition that if she came out, she should not be suffered to return. Grotius had now before him, at thirty-six, no prospect but that of a lifelong captivity. He did not abandon himself to despair, but sought refuge in returning to the classical pursuits of his youth. Several of his translations (into Latin) from the Greek tragedians and other writers, made at this time, have been printed. The Muses," he writes to Voss, "were now his consolation, and appeared more amiable than ever."

The ingenuity of Madame Grotius at length devised a mode of escape. It had grown into a custom to send the books which he had done with in a chest along with his linen to be washed at Gorcum. After a time the warders began to let the chest pass without opening it. Madame Grotius, perceiving this, prevailed on her husband to allow himself to be shut up in it at the usual time. The two soldiers who carried the chest out complained that it was so heavy "there must be an Arminian in it." "There are indeed," said Madame Grotius, "Arminian books in it."

The chest was carried to the house of a friend of Grotius who was released. He was then dressed like a monk with hood and trowel, and so conveyed over the frontier. His first place of refuge was Antwerp, from which he proceeded to Paris, where he arrived in April 1621. In October he was joined by his wife. There he was presented to the king, Louis XIII., and a pension of 3000 livres conferred upon him. French pensions were easily granted, all the more so as they were never paid. Grotius was now
reduced to great straits. He looked about for any opening through which he might earn a living. There was talk of something in Denmark; or he would settle in Spires, and practise in the court there. Some little relief he got through the intervention of Étienne d'Aligre, the chancellor, who procured a royal mandate which enabled him to draw out all, but a large part of his pension. In 1625, the president Henri de Même lent him his château de Balagni near Senlis (dep. Oise), and there Grotius passed the spring and summer of that year. De Thou gave him facilities to borrow books from the superb library formed by his father.

In these circumstances the *De jure bellii et pacis* was composed. That a work of such immense reading, consisting in great part of quotation, should have been written in little more than a year was a source of astonishment to his biographers. The achievements would have been impossible, but for the fact that Grotius had in his the first draft of the work made in 1604. He had also got his brother William, when reading his classics, to mark down all the passages which touched upon law, public or private. In March 1625 the printing of the *De jure bellii*, which had taken four months, was completed, and the edition despatched to the fair at Frankfort. His own honorarium as author consisted of 200 copies of which, however, he had to give away many to friends, to the king, the principal curators, the papal nuncio, &c. What remained he sold for his own profit at the price of a crown each, but the profit of the work, in his opinion, was to bring him no more than his reputation and the proceeds from it. But it was widely spread, and of such long endurance, as no other legal treatise has ever enjoyed.

Grotius hoped that his fame would soften the hostility of his foes, and that his country would recall him to her service. Theological rancour, however, prevailed over all other sentiments, and, after fruitless attempts to re-establish himself in Holland, Grotius accepted service under Sweden, in the capacity of ambassador to France. He was not very successful in negotiating the treaty, on behalf of the Protestant interest in Germany, Richelieu having a special dislike to him. He never enjoyed the confidence of the court to which he was accredited, and fretted away his influence in disputes about precedence. In 1645 he demanded and obtained his recall. He was honourably received at Stockholm, but neither the climate nor the tone of the court suited him, and he asked permission to leave. He was driven by a storm on the coast near Danzig. He got as far as Rostock, where he found himself very ill. Stockman, a Scottish physician who was sent for, thought it was only weakness, and that rest would restore the patient. But Grotius sank rapidly, and died on the 20th of August, 1645.

Grotius combined a wide circle of general knowledge with a profound study of one branch of law. History, theology, jurisprudence, politics, classics, poetry—all these fields he cultivated. His commentaries on the Scriptures were the first application on an extensive scale of the principle affirmed by Scaliger, that, namely, of interpretation by the rules of grammar without dogmatic assumptions. Grotius's philological skill, however, was not sufficient to enable him to work up to this ideal. As in many other points Grotius inevitably recalls Erasmus, so here his work shows the marks of that conflict of the ancients and the moderns which was, however, animated by an ardent desire for peace and concord. He thought that a basis for reconciliation of Protestant and Catholic might be found in a common piety, combined with reticence upon discrepancies of doctrinal statement. His *De veritate religionis Christianae* (1627), a presentation of the evidences, is so written as to form a code of common Christianity, irrespective of sect. The little treatise became widely popular, gaining rather than losing popularity in the 18th century. It became the classical manual of apologists in Protestant colleges, and was translated for missionary purposes into Arabic, Persian, Chinese, &c. His *Via et votum ad pacem ecclesiasticam* (1642) was a detailed proposal of a scheme of accommodation. Like all men of moderate and mediating views, he was charged by both sides with vacillation. An Amsterdam minister, James Laurens, published his *Grotius popissans* (1642), and it was continually being announced from Paris that Grotius had "gone over." Hallam, who has collected all the passages from Grotius's letters in which the prejudices and narrow tenets of the Reformed clergy are condemned, thought he had a "bias towards popery" (*Lit. of Europe*, ii. 312). The publication of the *Dei generatione* by J. K. Bluntschli, Grotius's attempt to refute dogmatic propositions, produced by a profound sentiment of piety. He approached parties as a statesman approaches them, as facts which have to be dealt with, and governed, not suppressed in the interests of some one of their number.

His editions and translations of the classics were either juvenile exercises prescribed by Scaliger, or "lusus poetici," the amusements of vacant hours. Grotius read the classics as a humanist, for the sake of their contents, not as a professional scholar.

His *Annals of the Low Countries* was begun as an official duty when he filled the post of vice-admiral of the provinces, and was beginning to be continued and retouched by him to the last. It was not published till 1675, by his sons Peter and Cornelius.

Grotius was a great jurist, and his *De jure bellii et pacis* (Paris, 1625), though not the first attempt in modern times to ascertain the principles of jurisprudence, went far more fundamentally into the discussion than any one had done before him. The title of the work was so far misleading that the *jus belli* was a very small part of his comprehensive scheme. In his treatment of this narrower question he had the works of Alberico Gentili and Ayala before him, and has acknowledged his obligations to them. But it is in the larger questions to which he opened the way that the merit of Grotius consists. His was the first attempt to obtain a principle of right, and a basis for society and government, outside the church or the Bible. The distinction between religion on the one hand and law and morality on the other is not indeed clearly conceived by Grotius, but he wrestles with it in such a way as to make it easy for those who followed him to seize it. The law of nature is unalterable; God Himself cannot alter it any more than He can alter a mathematical axiom. This law was, however, not to be found in the Bible, or in the ancient world, yet, in the traditional application they find in his book, entitle him to the honour of being held the founder of the modern science of the law of nature and nations. The *De jure* exerted little influence on the practice of belligerents, yet its publication was an epoch in the science. De Quincey has said that the book is equally divided between "empty truisms and time-serving Dutch falsehoods." For a saner judgment and a brief abstract of the contents of the *De jure belli et pacis*, see *Descriptio des allgemeinen Staatsrechts* (Munich, 1864). A fuller analysis, and some notice of the predecessors of Grotius, will be found in Hely, *Étude sur le droit de la guerre de Grotius* (Paris, 1875).

The writer, however, had never heard of the *De jure praedae*, published in 1868. Hallam, *Lit. of Europe*, ii. p. 543, has an abstract done with his usual conscientious pains. Dugald Stewart (Collected Works, i. 370) has dwelt upon the confusion and defects of Grotius's theory. Sir James Mackintosh (Miscell. Works, p. 165) has defended Grotius, affirming that his work was the first attempt to complete the world has yet owed, at so early a stage in the progress of any science, to the genius and learning of one man."

The chief writings of Grotius have been named. For a complete bibliography of his works, see Lehmann, *Huygens Grotii manes rendiit* (Delft, 1727), which also contains a full biography. Of this Latin life De Burigny published a réchauffée in French (2 vols. 8vo, Paris, 1752). Other lives are: Van Brandt, *Historie van het Leven H. de Groot* (2 vols., 8vo, Dordrecht, 1727); Von Luden, *Hugo Grotius nach seinen Schriften und Briefen in zwey Created by Berlin, 1860; Life of Hugo Grotius*, by Charles Butler of Lincoln's Inn (8vo, London, 1826). The work of the Abbé Hély contains a life of Grotius. See also *Hugo Grotius*, by L. Neumann (Berlin, 1884); *Grotius*, by D. P. Butler (London, 1894).

Grotius's theological works were collected in 3 vols. fol. at Amsterdam (1644-1646); reprinted London, 1660; Amsterdam, 1679; and again Amsterdam, 1698. His letters were printed first in *Selections*, Epistolae ad Galus (11mo, Leiden, 1648), abounding, though an Elzevir, in errors of the press. They were collected in *H.
GROTTAFERRATA

Grottai epistola qu Aguai se paterumr (fol., Amsterdam, 1687). A few may be found scattered in other collections of Epistola. Supplements to the large collection of 1687 were published at Haarlem, 1808; Leiden, 1809; and Haarlem, 1829. The De Jure bell i editie by Th. l'Escot, Amsterdam, 1853; into French by Barbeyrac (2 vols. 4to, Amsterdam, 1724); into German in Kirchmann's Philosophische Bibliothek (3 vols. 12mo, Leipzig, 1879).

GROTTAFERRATA, a village of Italy, in the province of Rome, from which it is 13 m. S.E. by electric tramway, and 21 m. S. of Frascati, 1880 ft. in the Alban Hills. Pop. (1901) 2645; noticeable for the Greek monastery of Basiliani founded by S. Nilus in 1002 under the Emperor Otho III., and which occupies the site of a large Roman villa, possibly that of Cicero. It was fortified at the end of the 15th century by Cardinal Giuliano della Rovere (afterwards Pope Julius II.), whose arms may be seen about it. The massive towers added by him give it a picturesque appearance. The church belongs to the 12th century, and the original portal, with a mosaic over it, is still preserved; the interior was restored in 1574 and in 1734, but there are some remains of frescoes of the 13th century. The chapel of S. Nilus contains frescoes by Domenico Zampieri (Domenichino) of 1610, illustrating the life of the saint, which are among his most important works. The abbiet's palace has a fine Renaissance portico, and contains an interesting museum of local antiquities. The library contains valuable MSS., among them one from the hand of S. Nilus (905); and a palaeographical school, for the copying of MSS. in the ancient style, is maintained. An omophorian of the 11th or 12th century, with scenes from the Gospel in needlework, and a chalice of the 15th century with enamels given by Cardinal Basadonna, the messenger of Giuliano della Rovere as commissioner of the abbey, are among its treasures. An important exhibition of Italo-Byzantine art was held here in 1905-1906.

GROUCHY, EMANUEL, MARQUIS DE (1766-1847), marshal of France, was born in Paris on the 23rd of October 1766. He entered the French artillery in 1779, transferred to the cavalry in 1782, and to the Gardes du corps in 1786. In spite of his aristocratic birth and his connexions with the court, he was a convinced supporter of the principles of the Revolution, and had in consequence to leave the Guards. About the time of the outbreak of war in 1792 he became colonel of a cavalry regiment, and soon afterwards, as a maréchal de camp, he was sent to serve on the south-eastern frontier. In 1793 he distinguished himself in La Vendée, and was promoted general of division. Grouchy was shortly afterwards deprived of his rank as being of noble birth, but in 1795 he was again placed on the active list. He served on the staff of the Army of Ireland (1796-1797), and in 1797 he was sent to the war in Ireland as a conspicuous part in the Irish expedition. In 1798 he administered the civil and military government of Piedmont at the time of the abdication of the king of Sardinia, and in 1799 he distinguished himself greatly as a divisional commander in the campaign against the Austrians and Russians. In covering the retreat of the French after the defeat of Novi, Grouchy received fourteen wounds and was taken prisoner. On his release he returned to France. In spite of his having protested against the coup d'état of the 18th of Brumaire he was at once re-employed by the First Consul, and distinguished himself again at Hohenlinden. It was not long before he accepted the Napoleonic régime in France, and from 1801 onwards he was employed by Napoleon in military and political positions of importance. He served in Austria in 1805, in Prussia in 1806, Poland in 1807, Spain in 1808, and commanded the cavalry of the Army of Italy in 1809 in the Viceroy Eugène's advance to Vienna. In 1812 he was made commander of one of the four cavalry corps of the Grand Army, and during the retreat from Moscow Napoleon appointed him to command the escort squadron, which was composed entirely of picked officers. His almost continuous service with the cavalry led Napoleon to decline in 1813 to place Grouchy at the head of an army corps, and Grouchy thereupon retired to France. In 1814, however, he hastened to take part in the latest campaign in France, and he was severely wounded at Craonne. At the Restoration he was deprived of the post of colonel-general of chasseurs à cheval and retired. He joined Napoleon on his return from Elba, and was made marshal and peer of France. In the campaign of Waterloo he commanded the reserve cavalry of the army, and after Ligny he was appointed to command the right wing to pursue the Prussians. The march on Wavre, its influence on the result of the campaign, and the controversy to which Grouchy's conduct on the day of Waterloo has given rise are dealt with briefly in the article Waterloo Campaign, and at length in nearly every work on the campaign of 1815. Here it is only necessary to say that on the 17th Grouchy was unable to close with the Prussians, and on the 18th, though urged to march towards the sound of the guns of Waterloo, he permitted himself, from whatever cause, to be held up by a Prussian rearguard while the Prussians and English united to crush Napoleon. On the 19th Grouchy won a small victory over the Prussians at Wavre, but it was then too late. So far as resistance was possible after the great disaster, Grouchy was prepared. He gathered up the wrecks of Napoleon's army and retired, steady and unbroken, to Paris, where, after interposing his reorganized forces between the enemy and the capital, he resigned his command into the hands of Marshal Davout. The rest of his life was spent in defending himself. An attempt to have him condemned to death by a court-martial failed, but he was exiled and lived in America till assassinated in 1821. On his return to France he was reinstated as general, but not as marshal nor as peer of France. For many years thereafter he was equally an object of aversion to the court party, as a member of the old guard who had followed the Revolution and Napoleon, and to his comrades of the Grand Army as the supposed betrayer of Napoleon. In 1830 Louis Philippe gave him back the marshal's baton and restored him to the Chamber of Peers. He died at St.-Étienne on the 29th of May 1847.

GROUND-ICE,1 ice formed at the bottom of streams while the temperature of the water is above freezing-point. Everything points to radiation as the prime cause of the formation of ground-ice. It is formed only under a clear sky, never in cloudy weather; it is most readily formed on dark rocks, and never under any covering such as a bridge, and rarely under surface ice. Professor Howard T. Barnes of McGill University concludes that the radiation of heat from a river bed in cold and clear nights goes through the water and warms that part of the ice above the surface from below upwards than the sun's heat rays from above downwards, which are mostly absorbed by the first few feet of water. On a cold clear night, therefore, the radiation from the bottom is excessive, and loosely-grown spongy masses of anchor-ice form on the bottom, which on the following bright sunny day receive just sufficient heat from the sun to detach the mass of 1 The O. Eng. word ground, ground, is common to Teutonic languages, cf. du. grond, Ger. Grund, but has no meaning in the Gr. The suggestion that this term is found in "grind," to crush small, reduce to powder, is plausible, but the primary meaning seems to be the lowest part or bottom of anything rather than grit or gravel. The English "ground" word used in the expression "a place to be, first, bottom, as of the sea or a river, cf. the use, in the plural, for dregs; second, base or foundation, actual, as of the first or main surface of a painting, fabric, &c., or figurative, as of a principle or reason; third, the surface of the earth, or a particular part of that surface.
ice, which rises to the surface with considerable force. It is prob-
able that owing to surface tension a thin film of stationary water
rests upon the boulders and sand over which a stream flows,
and that this, becoming frozen owing to radiation, forms the
foundation for the anchor-ice (see below) may well lodge. The
theory of radiation from the boulders is supported by the fact that
as the ice is formed upon them in response to a sudden fall in
the air temperature, it is only released under the influence of a strong
rise of temperature during the morning. It may not rise for
several days, but the advent of bright sunlight is followed by
the appearance of a mass of ground-ice. This ice has a spongy texture and frequently carries gravel with it
when it rises. It is said that the bottom of Lake Erie is strewn
with gravel that has been floated down in this way. This
"anchor-ice," as it was called by Canadian trappers, frequently
forms dams across narrow portions of the river where the
floating masses are caught. Dr. H. Landor pointed out that the
Mackenzie and Missouri rivers, which rise in the same region
and flow in opposite directions, carry ground-ice from their
headwaters for a considerable distance down stream, and
suggested that here and in Siberia many forms of vegetable
and animal life may be distributed from a centre by this agency,
since the material carried by the floating ice would contain the
seeds and eggs or larvae of many forms.

Besides ground-ice and anchor-ice this formation is called
also bottom-ice, ground-gru and lappeder ice, the two last names
being Scottish. In France it is called glace du fond, in Germany
Grundschnee, and in French Canada mouline, from the raising one
or two irregularly ovoid seeds. After the flower withers at the end
of the ovary there is the peculiarity of elongating and bending down,
forcing the young pod underground, and thus the seeds become
matured at some distance below the surface. Hence the specific
and vernacular names of the plant. Originally a native of
South America, it is extensively cultivated in all tropical and
subtropical countries. The plant affects a light sandy soil,
and is very prolific, yielding in some instances 30 to 38 bushels of nuts
per acre. The pods when ripe are dug up and dried. The seeds
when fresh are largely eaten in tropical countries, and in taste
are almost equal to almonds; when roasted they are used as a
substitute for chocolate. In America they are consumed in
large quantities as the "pea-nut"; but are not much appreciated
in England except by the poorer children, who know them as
"monkey-nuts." By expression the seeds yield a large quantity of
oil, which is used by natives for lamps, as a fish or curry
and for medicinal purposes. The leaves form an excellent food
for cattle, being very like clover.

Large quantities of seeds are imported to Europe, chiefly
to Marseilles, London and Hamburg, for the sake of their contained
oil. In the seeds yield it is exactly the same as the expression,
but a larger quantity is obtained by heat, although of an inferior
quality. The seeds being soft facilitate mechanical expression,
and where bisulphide of carbon or other solvent is used, a very
pure oil is obtained.

The expressed oil is limpid, of a light yellowish or straw colour,
having a faint smell and bland taste; it forms an excellent
substitute for olive oil, although in a slight degree more prone
to rancidity than the latter. Its specific gravity is 0.916 to
0.918; it becomes turbid at 3° C., concretes at +3° to +4° C. (in
the presence of acid) and solidifies at -4° to -7° C. It is a monobasic
acid. Ground nut oil consists of (1) oleic acid (C₁₈H₃₄O₂); (2) hypoacetic
acid (C₁₈H₃₄O₃); and (3) arachic acid (C₁₈H₃₄O₄). The oil is used in the adulteration of
gingelly oil.

GROUND-PEARL, the glassy secretion forming the pupacuse
of coccid insects of the genus Margarodes, belonging to the
homopterous division of the Hemiptera.

GROUND RENT. In Roman law, ground rent (solarium)
was an annual rent payable by the lessee of a superficies
or perpetual lease of building land. In English law, it appears that
the term was at one time popularly used for the houses and lands
out of which ground rents issue as well as for the rents themselves
(cf. Maudny v. Maudny, 2 Strange, 1820; and Lord Eldon
observed in 1830 that the context in which the term occurred
may materially vary its meaning (Stewart v. Alliston, 1 Mer. 26).
But at the present time the accepted meaning of ground rent is
the rent which at land is let for the purpose of improvement by
building, i.e., a rent charged in respect of the land only and not in
respect of the building. But in Scotland, this rent is called a "pron-dered" rent. The idea of something lower than a rack rent (see RENT),
and accordingly if a vendor described property as property for which
he paid a "ground rent," without any further explanation of
the term, a purchaser would not be obliged to accept the
property if it turned out to be held at a rack rent. But while a rack rent
is generally higher in amount than a ground rent, the latter is
usually better secured, as it carries with it the reversionary
interest in buildings and improvements put on the ground after
the date at which the ground rent was fixed, and accordingly
ground rents have been regarded as a good investment. Trustee
empowered to invest money on the security of freehold or
copyhold hereditaments, may invest upon freehold ground rents
reserved out of house property. In estimating the amount
that may be so invested, account may be taken of the value of
the houses, as, if the ground rents are not paid, the landlord
can enter. Again, where a settlement authorizes trustees to
purchase lands or hereditaments in fee-simple or possession, a
purchase of freehold ground rents has been held to be proper.
A devise of ground rent carries not only the rent but the
reversion. Where a tenant is compelled, in order to protect
himself in the enjoyment of a leasehold estate, to pay as
payable, to pay ground rent to a superior landlord (who is
considered as a tenant of the land in possession), he is considered
as having been authorized by his immediate landlord to apply
his rent, due or accruing due, in this manner, and the payment
of the ground rent will be held to be payment of the rent itself
or part of it. A judger should make any payment of this char-
acter under the Law of Distress Amendment Act 1908 (s. 3;
and see RENT). Ground rents are apportionable (see APPOR-
TIONMENT).

In Scots law, the term "ground rent" is not employed, but its
place has been taken, for practical purposes, by the "ground-anual,
which bears a double meaning. (i) At the time of the Reformation
in Scotland, the lands of the Church were parcelled out by the crown
into various lordships—the grantees being called Lords of Erection.
In the 17th century these Lord of Erection vested their
interests in the crown, with the exception of the feu-duities, which were to be
retained till a price agreed upon for their redemption had been paid.
This reserved power of redemption was, however, resigned by the
lords. The feudal system of the Union and the feu-duities became payable
in perpetuity to the Lords of Erection as a "ground-anual." (ii)
Speculators in building ground usually grant sub-feus to builders at
a high feu-duty. But where sub-feus are prohibited—as they might be
if the land be in the hands of the Crown—they may charge
it, even where there is much demand for building ground, the feuars frequently stipulate for
an annual rent from the builders rather than for a price payable at
once. This annual rent is called a "ground-anual." Interest is not
due on arrears of ground-annuals. Like other real burdens, ground-annuals may now be freely assigned and conveyed (Conveyancing (Scotland) Act 1874, s. 30).

The term "ground rent" in the English sense does not seem to be generally used in the United States, but is applied in Pennsylvania to a kind of tenure, created by a grant in fee simple, the grantor reserving to himself and his heirs a certain rent, which is the interest of the money value of the land. These "ground rents" are real estate, and, in cases of intestacy, go to the heir. They are rent services and not rent charges—the statute Quia Emptores never having been in force in Pennsylvania, and are subject to all the incidents of such rents (see Rent).

The grantee of such a "ground rent" may mortgage, sell, or otherwise dispose of the grant as he pleases; and while the rent is paid the land cannot be sold or the value of the improvements lost.

A ground rent being a freehold estate, created by deed and perpetual in duration, may, as a freehold and at common law, arise from lapse of time, that it had been released. But now, by statute (Act of 27th of April 1855, s. 7), a presumption of release or extinguishment is created where no payment, claim or demand has been made for the rent, nor any declaration or acknowledgment of its existence made or given by the owner of the premises subject to it, for the period of 21 years. Ground rents were formerly irredeemable after a certain time. But the creation of irredeemable ground rents is now forbidden (Pennsylvania Act 7 Assembly, 22nd of April 1830).

For English Law see Foa, Landlord and Tenant (3rd ed., London, 1906); Green, The Landlord (Edinburgh 1890); American Law, Bouvier, Law Dict. (Boston and London, 1897).

GROUNDSEL (Ger. Kreuzkraut; Fr. seneçon), Senecio vulgaris, an annual, glabrous, or more or less woolly plant of the natural order Composite, having a branched succulent stem 6 to 15 in. in height, pinnatifid irregularly and coarsely-toothed leaves, and small cylindrical heads of yellow tubular florets enclosed in an involucre of numerous narrow bracts; the ribbed fruit bears a soft, feathery, hoary tuft of hairs (pappus). The plant is indigenous to Europe, whence it has been introduced into all temperate climates. It is a troublesome weed, flowering throughout the year, and propagating itself rapidly by means of its light feathery fruits; it has its use, however, as a food for cage-birds. Senecio Jacobaea, ragwort, is a showy plant with heads of bright yellow flowers, common in pastures and hedgerows; its name is from the one, which it occasionally distributed in temperate and cold climates. The British species are all herbs, but the genus also includes shrubs and even arborescent forms, which are characteristic features of the vegetation of the higher levels on the mountains of tropical Africa. Many species of the genus are handsome florists' plants. The groundsel tree, Baccharis halimifolia, a native of the North American sea-coast from Massachusetts southward, is a Composite shrub, attaining 6 to 12 ft. in height, and having angular branches, obovate or oblong-cuneate, somewhat scurfy leaves, and flowers larger than but similar to those of common groundsel. The long white pappus of the female plant renders it a conspicuous object in autumn. The groundsel tree has been cultivated in British gardens since 1833.

The Old English word, represented by "groundsel," appears in two forms, granduersefge and grandeswæge; of the first form the accepted derivation is from grand, ground, and mouga, to swallow; a weed of such rapid growth would not inaptly be styled a "ground-swallow." If the form without the r be genuine, the word might mean thus-absorber (O.E. gerund gund, and to absorb, refer with reference to its use in potteries for abscesses and the like.

GROUND-SQUIRREL, one of the names for a group of (chiefly North American striped terrestrial squirrel-like rodents, more generally known as chipmunks. They are closely allied to squirrels, from which they are distinguished by the possession of cheek-pouches for the storage of food. The sides, or the sides and back, are marked with light stripes bordered by dark bands; the ears are small, and without tufts; and the tail is relatively short. With the exception of one Siberian species (Tamias astilactus), ground-squirrels are confined to North America, where they are represented by a large number of species and races, all referable to the genus Tamias. In North America ground-squirrels are migratory, and may be abundant in a given locality one year, and absent the next year, and they feed on nuts, beechnut, corn and roots, and also on grubs. With the assistance of their cheek-pouches they accumulate large supplies of food for the winter, during which season they lie dormant in holes. Although generally keeping to the ground, when hunted they take to trees, which they climb in search of food. One of the longest known American species is T. striatus.

GROUPS, THEORY OF. The conception of an operation to be carried out on some object or set of objects underlies all mathematical science. Thus in elementary arithmetic there are operations on the natural objects: addition and the multiplication of integers; in algebra a linear transformation is an operation which may be carried out on any set of variables; while in geometry a translation, a rotation, or a projective transformation are operations which may be carried out on any figure.

In speaking of an operation, an object or a set of objects to which it may be applied is postulated; and the operation may, and generally will, have no meaning except in regard to such a set of objects. If two operations, which can be performed on the same set of objects, are such that, when carried out in order on any possible object of the result, whichever operation is performed first, is to produce no change in the object, then each of the operations is spoken of as a definite operation, and each of them is called the inverse of the other. Thus the operations which consist in replacing x by nx and by x/n respectively, in any rational function of x, are definite inverse operations, if n is any assigned number except zero. On the contrary, the operation of replacing x by an assigned number in any rational function of x is not, in the present sense, although it leads to a unique result, a definite operation; there is in fact no unique inverse operation corresponding to it. It is to be noticed that the question whether an operation is a definite operation or no may depend on the range of the objects on which it operates. For example, the operations of squaring and extracting the square root are definite inverse operations if the objects are restricted to be real positive numbers, but not otherwise.

If O, O', O"... is the totality of the objects on which a definite operation S and its inverse S' may be carried out, and if the result of carrying out S on O is represented by O, then O.S',O.S... and are the same objects whatever object S.O may be.

The operations S and S' are sometimes called the conjugates of one another, O.S.S'.O.S.S... are objects of the set. These will be represented by O.S'. O.S... Suppose now that T is another definite operation with the same set of objects as S and S', then T' is the inverse of the operation of T, and therefore the result of carrying out S and then T on the set of objects is some operation U with a unique result. Represent by U' the result of carrying out T' and then S'. Then O.UU' = O.S.T'.S'.S' = O.S' = 0, and O.UU' = O.T'.S'.T = O.T'O, whatever object O may be. Hence UU' = U'U = 1; and U, U' are definite inverse operations.

If S, U, V are definite operations, and if S' is the inverse of S, then

\[ S \cdot S' = 1 \quad \text{and} \quad S' \cdot S = 1 \]

implies

\[ S\cdot V = S\cdot U = V = 1 \quad \text{and} \quad S' \cdot V = V = 1 \quad \text{and} \quad S' \cdot U = U = 1 \]

Similarly

\[ S = SU = VS = VS' = U = V \]

Let S, T, U, V... be a set of definite operations, capable of being carried out on a common object or set of objects, and let the set contain—

(i.) the operation ST, S and T being any two operations of the set;
(ii.) the inverse operation of S, S being any operation of the set;
the set of operations is then called a group. The number of operations in a group may be either finite or infinite. When it is finite, the number is called the order of the group.

1 The word "group," which appears first in English in the sense of an assemblage of figures in an artistic design, picture, &c., is adapted from the Fr. groupe, which is to be referred to the Teutonic word meaning "knot," "mass," "bunch," represented in English by "crop" (q.v.). The technical mathematical sense is not older than 1870.
The group $g$, abstractly considered, is therefore completely determined by the division of the operations of $G$ into sets in respect of the self-conjugate subgroup $H$. From this point of view it is spoken of as the fundamental operations of $G$. The method of representing the operations of $G$ is the same as that used in the study of the group $G/H$. Any composite group in a similar way defines abstractly a factor-group in respect of each of its self-conjugate subgroups. Since from any group it is always possible to choose from its operations a set such that every operation of the group can be obtained by combining the operations of the set and their inverses, if the set is such that none of the operations belonging to it can be represented in terms of the others, it is called a set of independent generating operations. Such a set of generating operations may be either finite or infinite in number. If $A, B, \ldots, E$ are the generating operations of a group, the group generated by $A, B, \ldots, E$, is denoted by $G_{ABEH}$. If $O'$, $O''$, \ldots, is an extension of this symbol used such that $[A, H]$ represents the group generated by combining an operation $A$ with every operation of a group $H$. In the present section, these possibilities are used in forming all possible ways the operations of the groups $H_1$ and $H_2$ and so on. The independent generating operations of a group may be subject to certain relations connecting them, but these must be such that it is impossible by combining them to obtain a relation expressing any operation in terms of the others. For instance, $AB = BA$ is a relation conditioning the group $[A, B]$; it does not, however, enable $A$ to be expressed in terms of $B$, so that $A$ and $B$ are independent generating operations.

Let $O$, $O'$, $O''$, \ldots be a set of objects which are interchanged among themselves by the operations of a group $G$, so if $S$ is any operation of $G$ and $O'$ is an object occurring in the set $S$, then $S$ is a self-conjugate subgroup of $G$, and interchanges among themselves, or changes them all into objects of some other set; the operation $R$ of transposing the objects of the set in a certain order, is called an isomorphism in respect of the set; otherwise the group is called primitive. A group which is doubly-transitive, in respect of a set of objects, obviously cannot be imprimitive.

The foregoing general definitions and explanations will now be illustrated by a consideration of certain particular groups. To begin with, the operations involved are of the most familiar nature, the group of rational arithmetic may be considered. The fundamental operations of elementary arithmetic consist in the addition and subtraction of integers, and multiplication and division by integers, division by zero being excluded. Moreover, since a group is identical with the group of its own operations, and it must therefore be omitted in dealing with those operations of elementary arithmetic which form a group. The operations results from carrying out additions, subtractions, multiplications and divisions, with rules, the group of operations obtained is represented by the relation $x' = ax + b$, where $a$ and $b$ are rational numbers of which $a$ is not zero, $x$ is the object of the operation, and $x'$ is the result. The group of operations is self-conjugate.

If $S$ and $T$ represent respectively the operations $x' = ax + b$ and $x' = cx + d$, then $TST$ represents $x' = ax + b$, and $x$ and $b$ are given rational numbers, $a$ and $b$ may be chosen in an infinite number of ways as rational numbers, so that $a - ad + bc$ shall be any assigned rational number. Hence the operations given by $x' = ax + b$, where $a$ is an assigned rational number and $b$ is any rational number, are all conjugate; and no two such operations for which the $d$'s are different can be conjugate. If $a$ is unity and $b$ zero, $S$ is the identical operation which is necessarily self-conjugate. If $a$ is unity and $b$ different from zero, the operation $x' = ax + b$ is an addition. The transformations which add to or subtract from a given number, are additions of a kind. Moreover, the totality of additions with the identical operation, i.e. the totality of operations of the form $x' = ax + b$, where $a$ may be any rational number or zero, obviously constitutes a group. The operations of this group are interchanged among themselves when transformed by any operation of the original group. It is therefore a self-conjugate subgroup of the original group. The operations of multiplications, with the identical operation, i.e. all operations of the form $x' = ax + b$, with $a$ any rational number other than zero, again obviously constitutes a group. This, however, is not a self-conjugate subgroup of the original group. In fact, if the operation $x' = ax + b$ is written in the more familiar language of linear transformations, $x' = ax + b$ is represented to the set $x' = ax + d(1 - a)$. When $d$ is a given rational number, the set constitutes a subgroup which is conjugate to the group of multiplications. It is to be noticed that the operations of this latter subgroup are better written in the form $x' = ax + b$.
GROUPS, THEORY OF

If \(x_1\) and \(x_2\) are any pair of distinct rational numbers, and \(y_1\) and \(y_2\) any other pair, there is just one operation of the group which leaves \(x_1\) and \(x_2\) unaffected, respectively. For the equations \(y_1 = a_1 x_1 + b_1\), \(y_2 = a_2 x_2 + b_2\) determine \(a\) and \(b\) uniquely. The group is therefore doubly transitive in respect of the set of rational numbers. If \(H\) is the group, then \(x_1\) is a leaf which leaves a given rational number \(x_1\) and \(S\) an operation changing \(x_1\) into \(x_2\), then every operation of \(S\) leaves \(x_2\) unchanged. The subgroups, each of which leaves a single rational number unchanged, cannot be conjugate, for in each there are operations which leave zero unchanged; and, as has been seen, this is conjugate with the subgroup formed of all operations \(x' = d x\), where \(d\) is a given rational number. This subgroup leaves \(x\) unchanged.

The group of multiplications is clearly generated by the operations \(x' = p x\), where \(p\) negative unity and each prime is taken in turn. Every addition is obtained on transforming \(x' = x + 1\) by the different operations of the group. Hence \(x' = x + 1\), \(p = -1, 3, 5, 7, \ldots\), form a set of independent generating operations of the group. It is a discontinuous group.

As a second example the group of motions in three-dimensional space will be considered. The totality of motions, i.e. of space displacements which leave the distance of every pair of points unaltered, obviously constitutes a set of operations which satisfies the group definition. From the elements of kinematics it is known that every motion is either (i.) a translation which leaves no point unaltered, but changes each of a set of parallel lines into itself; or (ii.) a rotation which leaves every point of one line unaltered and brings another line to coincide with it, about a point and on the first line. The translation is of course a rotation along a line AB, and a rotation along a line AB, and let T be any other motion. There is some line CD into which T changes AB; and therefore T**ST** leaves CD unchanged. Moreover, T**ST** clearly effects the same translation along and with the line AB. Hence \(x' = x + t\), and therefore, are conjugate if and only if the amplitudes of their translation and rotation components are respectively equal. In particular, all translations of the same direction and amplitudes are identical, as also are all rotations of the same axis. Any two translations are permutable with each other, and give when combined another translation. The totality of translations constitutes, therefore, a subgroup of the general group of motions. So also do the lines of space and all the planes in respect of each of these sets the group is simply transitive. In fact, there is an infinite number of motions which change a point A to A', but no motion can change A and B to A' and B' respectively unless the distance AB is equal to the distance A'B'.

The totality of motions which leave a point A unaltered forms a subgroup. It is clearly constituted of all possible rotations about all possible axes through A, and this subgroup is a self-conjugate subgroup, since a translation is always conjugate to a translation. All the points of space constitute a set of objects which are interchanged among themselves by all operations of the group of motions. So also do the lines of space and all the planes. In respect of each of these sets the group is simply transitive. In fact, there is an infinite number of motions which change a point A to A', but no motion can change A and B to A' and B' respectively unless the distance AB is equal to the distance A'B'.

The determination of a particular operation of a group consists in assigning special values to each one of a set of parameters which are capable of continuous variation. The first distinction regards the number of these parameters.

Continuous Groups.

The determination of a particular operation of a given continuous group depends on assigning special values to each one of a set of parameters which are capable of continuous variation. If this number is finite, the group is called a finite continuous group; if infinite, it is called an infinite continuous group.

In the latter case arbitrary functions must appear in the equations defining the topological form of the group when these are reduced to a canonical form. The theory of infinite continuous groups is not yet so completely developed as that of finite continuous groups.

The latter theory will mainly occupy us here.

Sophus Lie, to whom the foundation and a great part of the development of the theory of continuous groups are due, undoubtedly approached the subject from a geometrical standpoint. His conception of an operation is to regard it as a geometrical transformation, by means of which each point of a (n-dimensional) space is changed into some other definite point.

The representation of such a transformation in analytical form involves a system of equations,

\[ x'_a = f(a_1, x_1, x_2, x_3, \ldots, x_n) \]

expressing \(x'_1, x'_2, \ldots, x'_n\), the co-ordinates of the transformed point in terms of \(x_1, x_2, \ldots, x_n\), the co-ordinates of the original point.

In these equations the functions \(f_1, f_2, \ldots, f_n\) are analytical functions of their arguments. Within a properly limited region they must be one-valued, and the equations must admit a unique solution with respect to \(x_1, x_2, \ldots, x_n\) since the operation would not otherwise be a definite one.

From this point of view the operations of a continuous group, which depends on a set of parameters, will be defined analytically by a given set of equations of the form

\[ x'_a = f(a_1, x_1, x_2, x_3, \ldots, x_n) \]

where \(a_1, a_2, \ldots, a_r\) represent the parameters. If this operation be represented by \(a_1, a_2, \ldots, a_r\) and that in which \(b_1, b_2, \ldots, b_r\) are the parameters by \(b_1, b_2, \ldots, b_r\), then the operation \(b_1, b_2, \ldots, b_r\) followed by that \(a_1, a_2, \ldots, a_r\) is one in which the parameters are denoted \(a_1, a_2, \ldots, a_r\), and consequently the equations (i) must be the same as those (ii), and the equations

\[ x'_a = f(a'_1, x'_1, x'_2, \ldots, x'_n) \]

\[ b_1, b_2, \ldots, b_r \]

Conversely, if equations (i), are such that these two conditions are satisfied, they do in fact define a finite continuous group.

It will be assumed that the \(r\) parameters which enter in equations (i) are independent, i.e. that it is impossible to choose \(r\) (or less) quantities in terms of which \(a_1, a_2, \ldots, a_r\) can be expressed. Where this is the case the group will not be a finite group. For if the equations are solvable for \(a_1, a_2, \ldots, a_r\) in terms of \(x_1, x_2, \ldots, x_n\), then the same values of the new parameters \(a_1, a_2, \ldots, a_r\) give the identical operation.

There are infinitesimal values of the parameters, thus chosen, will correspond to operations which cause an infinitesimal change in each of the variables. These are called infinitesimal operations. The most general infinitesimal operation of the group is given by the system

\[ x'_a - x_a = \epsilon_{a1} \delta_{b1} + \epsilon_{a2} \delta_{b2} + \ldots + \epsilon_{an} \delta_{bn}, \]

where \(\epsilon_{ai} \delta_{bi}\) are infinitesimal quantities, and \(\epsilon_{ai}\) is an infinitesimal. If \(F(x_1, x_2, \ldots, x_n)\) is any function of the variables, and if an infinitesimal operation of the group be carried out on the variables in \(F\), the resulting increment of \(F\) will be

\[ \Delta F = \left( \frac{\partial F}{\partial \epsilon_{a1}} \right) \epsilon_{b1} + \left( \frac{\partial F}{\partial \epsilon_{a2}} \right) \epsilon_{b2} + \ldots + \left( \frac{\partial F}{\partial \epsilon_{an}} \right) \epsilon_{bn}, \]

The differential operator

\[ \epsilon_{a1} \frac{\partial}{\partial \epsilon_{b1}} + \epsilon_{a2} \frac{\partial}{\partial \epsilon_{b2}} + \ldots + \epsilon_{an} \frac{\partial}{\partial \epsilon_{bn}} \]
be represented by \(X_i\), \(i = 1, 2, \ldots, r\), then the increment of \(F\) is given by
\[
(\varepsilon X_i + \epsilon_2 X_2 + \ldots + \epsilon_n X_n) F_{\theta}
\]
When the equations (ii) defining the general operation of the group are given, the coefficients \(\delta F/\delta a_i\) which enter in these differential operators are functions of the variables which can be directly calculated.

The differential operator \(\varepsilon X_i + \epsilon_2 X_2 + \ldots + \epsilon_n X_n\) may then be regarded as defining the most general infinitesimal operation of the group. In fact, if it be for a moment represented by \(X_i\), then \((1 + \varepsilon X_i) F\) is the result of carrying out the infinitesimal operation on \(F\); and by putting \(s_1, s_2, \ldots, s_n\) in turn for \(\varepsilon\), the actual infinitesimal operation is reproduced. By a very convenient, though perhaps hardly justifiable, phraseology this differential operator is spoken of as the general infinitesimal operation of the group. The sense in which this phraseology is to be understood will be made clear by the foregoing explanations.

We suppose that the constants \(c_1, c_2, \ldots, c_n\) have assigned values.

Then the result of repeating the particular infinitesimal operation \(\varepsilon X_i + \epsilon_2 X_2 + \ldots + \epsilon_n X_n\) or \(X\) an infinite number of times is some finite operation of the group. The effect of this finite operation on \(F\) may be directly calculated. In fact, if \(\delta\) is the infinitesimal already introduced, then
\[
\frac{dF}{d\delta} = X_i F + \frac{\partial F}{\partial x_1} X_1 + \ldots + \frac{\partial F}{\partial x_n} X_n
\]
Hence
\[
F' = F + X_i F' + \frac{\partial F}{\partial x_1} X_1 + \ldots + \frac{\partial F}{\partial x_n} X_n
\]
and
\[
F'' = F' + X_i F'' + \frac{\partial F'}{\partial x_1} X_1 + \ldots + \frac{\partial F'}{\partial x_n} X_n
\]
is
\[
F^n = F + \frac{1}{2!} X_i F'' + \frac{1}{3!} X_i F''' + \ldots + \frac{1}{n!} X_i F^n
\]
The group thus generated by the repetition of an infinitesimal operation is called a cyclical group; so that a continuous group contains a cyclical subgroup corresponding to each of its infinitesimal operations.

The system of equations (ii) represents an operation of the group whatever the constants \(c_1, c_2, \ldots, c_n\) may be. Hence if \(\tilde{a}_1, \tilde{a}_2, \ldots, \tilde{a}_n\) be the equations (ii), it represents a set of operations, depending on \(r\) parameters and belonging to the group. They must therefore, in a formal sense, be the general equations of the infinitesimal operations of the group, and are equivalent to the equations (i.).

The determination of the finite equations of a cyclical group, when the infinitesimal operation which generates it is given, will always depend on the integration of a set of simultaneous ordinary differential equations. As a very simple example we may consider the case in which the infinitesimal operation is given by \(X = x \partial / \partial x\), so that there is only one single variable. The relation between \(x'\) and \(x\) is given by \(dx'/dx = x\), with the condition that \(x' = x\) when \(t = 0\). This gives at once \(x' = x(1 - t)\), which might also be obtained by the direct use of (ii).

When the finite equations (i.) of a continuous group of order \(r\) are known, it has now been seen that the differential operator which defines the most general infinitesimal operation of the group can be directly constructed, and that it contains \(r\) arbitrary constants. This is equivalent to saying that the group contains \(r\) linearly independent infinitesimal operations; and that the most general infinitesimal operation is obtained by combining these linearly with arbitrary constants.

Any infinitesimal operation of the group are known, it has been seen how the general finite operation of the group may be calculated. This gives at once \(x' = x(1 - t)\), which might also be obtained by the direct use of (ii).

The determination of the finite equations (i.) of a continuous group of order \(r\) are known, it has now been seen that the differential operator which defines the most general infinitesimal operation of the group can be directly constructed, and that it contains \(r\) arbitrary constants. This is equivalent to saying that the group contains \(r\) linearly independent infinitesimal operations; and that the most general infinitesimal operation is obtained by combining these linearly with arbitrary constants.

Any infinitesimal operation of the group are known, it has been seen how the general finite operation of the group may be calculated. This gives at once \(x' = x(1 - t)\), which might also be obtained by the direct use of (ii).
GROUPS, THEORY OF

must be satisfied. Conversely, if such a set of relations is satisfied, \(X_1, X_2, \ldots, X_r\) generate a subgroup of order \(r\), which contains every subgroup of order \(r\) and each of the individual generating operations, and is therefore a self-conjugate subgroup.

A specially important self-conjugate subgroup is that generated by \(X_1, X_2, \ldots, X_r\), which leaves each of the individual generating operations unchanged. Thus these generate a self-conjugate subgroup follows from the relations (iii). In fact, 

\[
(X_1 X_2) X_3 = \cdots = (X_r X_2) X_3
\]

Of the \(j(r-1)\) combinations not more than \(r\) can be linearly independent. When exactly \(r\) of them are linearly independent, the self-conjugate group generated by them coincides with the original group. If \(r\) is less than \(r\), then a self-conjugate subgroup generated by them is actually a subgroup; i.e. its order is less than that of the original group. This subgroup is known as the derived group, and Lie has called a group perfect when it contains only the identity and derived group. In such a group, since it contains no self-conjugate subgroup distinct from itself, is necessarily a perfect group.

If \(G\) is a given continuous group, \(G_1\) the derived group of \(G, G_2\) that of \(G_1\), and so on, the series of groups \(G, G_1, G_2, \ldots\) will terminate either with the identity operation or with a perfect group; for the order of \(G_{n+1}\) is less than that of \(G_n\) unless \(G_n\) is a perfect group. When the series terminates with the identical operation, \(G\) is said to be an integrable group; in the contrary case \(G\) is called non-integrable.

If \(G\) is an integrable group of order \(r\), the infinitesimal operations \(X_1, X_2, \ldots, X_r\) which generate the group may be chosen so that \(X_1, X_2, \ldots, X_r\) (in cycles) generate the first derived group, \(X_2, X_3, \ldots, X_r, (r < n)\) the second derived group, and so on. With this choice, it is clear that if \(r < \frac{n(n-1)}{2}, r < \frac{n(n-1)}{3}, r < \frac{n(n-1)}{4}, \ldots\), then \(c_{ij}\) vanishes unless \(i \leq j\).

In particular, the generating operations may be chosen so that \(c_{ij}\) vanishes unless \(i = j\) is equal to or less than the smaller of the two numbers \(r, j\); and conversely, if the \(c_{ij}\) satisfy these relations, the group is integrable.

A simple group, as already defined, is one which has no self-conjugate subgroup. It is a remarkable fact, however, that the determination of all distinct types of simple continuous groups has been made, for in the case of discontinuous groups and groups of finite order this is far from being the case. Lie has demonstrated that the number of simple groups is infinite.

(i.) The groups simply isomorphic with the general projective group in space of \(n\) dimensions. Such a group is defined analytically as the totality of the transformations of the form

\[
x_1 = a_1 x_1 + a_2 x_2 + \cdots + a_n x_n + a_{n+1}, \quad x_2 = a_{n+2} x_1 + a_{n+3} x_2 + \cdots + a_{2n} x_n + a_{2n+1}, \quad \ldots \quad x_n = a_{n^2} x_1 + a_{n^2+1} x_2 + \cdots + a_{n^2+n} x_n + a_{n^2+n+1},
\]

where the \(a\)'s are parameters. The order of this group is clearly \(n(n+2)\).

(ii.) The groups simply isomorphic with the totality of the projective transformations which transform a non-special linear complex in \(n-1\) dimensions with itself. The order of this group is \(n(n-1)\).

(iii.) and (iv.) The groups simply isomorphic with the totality of the projective transformations which change a quadratic of non-vanishing discriminant. These fall into two distinct classes of types according as \(n\) is even or odd. In either case the order is \(3n(n-1)\). The case \(n = 3\) forms an exception in which the corresponding group is not simple. It is also to be noticed that a cyclcical group is a simple group, since it has no continuous self-conjugate subgroup distinct from itself.

W. K. J. Killing and E. J. Cartan have separately proved that outside these four great classes there exists only five distinct types of simple groups, whose orders are \(14, 52, 78, 133, 248\); thus completing the enumeration of all possible types.

To prevent any misapprehension as to the bearing of these very general results, it is well to point out explicitly that there are no limitations on the parameters of a continuous group as has been defined above. They are to be regarded as taking in general complex values. If in the finite equations of a continuous group the imaginary symbol does not explicitly occur, the finite equations will usually define a group (in the general sense of the original definition) when both parameters and variables are limited to real values. Such a group is, in a certain sense, a continuous group; and such groups have been considered shortly by Lie (cf. Lie-Engel, iii. 360-392), who calls them real continuous groups. To these real continuous groups we have found three dimensions Lie also to be noted that this is not a group; and indeed, in all probability, the number of types of real simple continuous groups admits of no complete enumeration. The real limitation to real transformations may be illustrated by considering the groups of projective transformations which change

\[
x^2 + y^2 + z^2 = 1 = 0 \quad \text{and} \quad x^2 + y^2 + z^2 = 0
\]

respectively into themselves. Since one of these quadrics is changed into the other by the imaginary transformation

\[
x' = x, \quad y' = y, \quad z' = z = \pm 1
\]

the general continuous groups which transform the two quadrics respectively into themselves are simply isomorphic. This is not, however, the case for each of the two groups. In fact, this second quadric has two real sets of generators; and therefore the real group which transforms it into itself has two self-conjugate subgroups, each of which leaves one of the sets of generators unchanged. The first quadric having imaginary generators, no such self-conjugate subgroups can exist for the real group which transforms it into itself; and this real group is in fact simple.

When the groups in question with a given continuous group there is one of special importance which is known as the adjoint group. This is a homogeneous linear group in a number of variables equal to the order of the group, whose infinitesimal operations are defined by the equations

\[
x_i = \varepsilon_{i \delta} x_{\delta} \quad (j = 1, 2, \ldots, r),
\]

where \(\varepsilon_{i \delta}\) are the often-used constants, which give the combinatorial of the infinitesimal operations in terms of the infinitesimal operations themselves.

The \(r\) infinitesimal operations thus defined actually generate a group isomorphic with the given group is verified by forming their combinatorial. It is thus found that \((X_1 X_2, X_1 X_2, X_1 X_2)\) is the adjoint group. The \(X_1, X_2, \ldots, X_r\), however, are not necessarily linearly independent. In fact, the sufficient condition that \(2X_1 \varepsilon_{1 \delta} = 0\) for all values of \(i\) and \(s\), have \(r\) linearly independent solutions, only \(r^2\) of the \(X_1, X_2, \ldots, X_r\) are linearly independent, and the isomorphism of the two groups is simple. If \(Y_1, Y_2, \ldots, Y_r\) are the infinitesimal operations of the given group, the equations

\[
x_1 = 2 \varepsilon_{1 \delta} Y_\delta, \quad (i = 1, 2, \ldots, r)
\]

express the condition that the operations of the cyclical group generated by \(X_1, Y_1, Y_2, \ldots, Y_r\) should be permutable with every operation of the group; in other words, that they should be self-conjugate operations. In the case supposed, therefore, the given group and the subgroup of order \(r\) of each of these operations is self-conjugate. The adjoint group of a given group will therefore be simply isomorphic with the group, unless the latter contains self-conjugate operations; and when this is the case the order of the adjoint group is less than the order of the subgroup formed of the self-conjugate operations.

We have been thus far mainly concerned with the abstract theory of continuous groups, in which no distinction is made between two simply isomorphic groups. We proceed to discuss the classification and theory of groups when their form is regarded as essential; and this is a return to a more geometrical point of view.

It is natural to begin with the projective groups, which are the simplest in form and at the same time are of supreme importance in geometry. The general projective group of the straight line is the group of order three given by

\[
x'_i = a_{i j} x_j + a_{i k} x_k \quad (i = 1, 2, 3)
\]

where the parameters are the ratios of \(a_{i j}, a_{i k}\).

Continuous groups of the plane, and of three-dimensional space.

The analysis of the general projective group must obviously increase very rapidly in complexity, as the dimensions of the space to which it applies increase. This analysis has been completely carried out for the projective group of the plane, with the result of showing that there are thirty distinct types of subgroup. Excluding the general group itself, every one of these leaves either a point, a line, or a conjection unaltered; but there has also carried out a similar investigation, but the results are extremely complicated. One general result of great importance at which Lie arrives in this connexion is that every projective group in space of more than three dimensions Lie either a point, a curve, a surface or a linear complex unaltered.

Returning now to the case of a single variable, it can be shown that any finite continuous group in one variable is either cyclic or of order two or three; and such a group may be changed into a projective group.

The genesis of an infinite as distinguished from a finite continuous group may be well illustrated by considering the case of a single variable. The infinitesimal operations of the projective group in one variable are

\[
\frac{dt}{dx} = \frac{dy}{dx} = \frac{dz}{dx}
\]

where these combined with \(x^2 \frac{dx}{dx} = 0x = 0\).
taken as infinitesimal operations from which to generate a continuous group among the infinitesimal operations of the group, there must occur the combinator of $x^2$ and $x^2$. This is $x^2$. The combinator of this and $x^2$ is $x^2 + x^2$ and so on. Hence $x^2$, where $r$ is any positive integer, is an infinitesimal operation of the group. The general infinitesimal operation of the group is therefore $x(s) = x^r$, where $x(s)$ is an arbitrary integral function of $x$. In general, the group projects into non-projective, two or more variables, the distinction between primitive and non-projective groups immediately presents itself. For groups of the plane the following question arises. Is there or is there not a group such that for every infinitesimal operation the curves of the family among themselves? In accordance with the previously given definition, this is a so-called infinitesimal transformation; $x^r = x^r$, with $x$ a primitive constant according as such an operation or set exists or not. In space of three dimensions there are two possibilities; namely, there may be either a singly infinite system of surfaces $F(x, y, z) = C$, which are interchanged among themselves by the operations of the group; or there may be a doubly-infinite system of curves $G(x, y, z) = a$, which are so interchanged.

In regard to primitive groups $L$ it is shown that any primitive group may be decomposed into a suitably chosen transformation, and groups of contact-transformations. This conception, like that of continuous groups, owes its origin to Lie.

From a purely analytical point of view a contact-transformation may be defined as a point-transformation in $2n+1$ variables, $x_1, x_2, \ldots, x_n, p_1, p_2, \ldots, p_n$ which leaves the equation $dz - pdx = p dy$ unchanged. Such a transformation, as this, however, gives no direct clue to the geometrical properties of the transformation, nor does it explain the name given.

In dealing with contact-transformations we shall restrict ourselves to the case of two dimensions, but it will be necessary to begin with some purely geometrical considerations. An infinitesimal surface-element in space of three dimensions is completely specified, apart from its size, by its position and orientation. There are, therefore, any three surface elements in three-dimensional space.

The surface-elements of a surface form a system of $2n$ elements, for there are $3^2$ points on the surface, and each surface contains the tangent to the curve at the point. Similarly the surface-elements which contain a given point clearly form a system of $2n$ points, because any three of these determine a system of the tangent to a surface.

Now the most general way in which a system of $2n$ surface-elements can be given is by three independent equations between $x, y, z, p$ and $q$. If these equations do not contain $p, q$, they determine one or more (a finite number in any case) points in space, and the system of surface-elements consists of the elements containing these points; i.e., $x, y, z, p, q$. This is the third kind of contact-transformation. If the equations are such that two distinct equations independent of $p$ and $q$ can be derived from them, the points of the system of surface-elements lie on a curve. For such a system the equation $ds - pdx - qdy = 0$ will hold for each two consecutive elements only when the plane of each element touches the curve at its own point.

If the equations are such that only one equation independent of $p$ and $q$ can be derived from them, the points of the system of surface-elements lie on a surface. Again, for such a system the equation $ds - pdx - qdy = 0$ will hold for each two consecutive elements only when each element touches the surface at its own point. Hence, when we have a system of $2n$-elements which belong to any three special types in which the elements belong, in the sense explained, to a curve or to a surface.

Let us consider now the geometrical bearing of any transformation $x' = f(x, y, z, p, q)$, $y' = f(x, y, z, p, q)$, of the five variables. It will interchange the surface-elements of space among themselves, and therefore change any area which is generated by $\infty^2$ elements. A special system, i.e., a system which belongs to a point, curve, or surface, will, not, however, in general be changed into another special system. The necessary and sufficient condition that the system should be always changed is that the equation $ds - pdx - qdy = 0$ should be a consequence of the equation $ds - p'dx - q'dy = 0$; or, in other words, that this latter equation should be invariant for the transformation

When this condition is satisfied the transformation is such as to change the surface-elements of a surface in general into surface-elements of a surface, though in particular cases they may become the surface-elements of a curve or a point, and similar statements may be made with respect to a curve or point. The transformation is therefore a veritable geometrical transformation in space of three dimensions. Moreover, two special systems of surface-elements may be transformed into two new special systems with an element in common. Hence two curves or surfaces which touch each other are transformed into two new curves or of which touch each other. It is this property which leads to the transformations in question being called contact-transformations.

It will be noticed that an ordinary point-transformation is always a contact-transformation, but that a contact-transformation (in space of $n$ dimensions) is not in general a point-transformation (in space of $n+1$ dimensions), though it may always be regarded as a point-transformation in space of $2n+1$ dimensions. In the analogous theory for space of two dimensions a line-element, defined by $(x, y, p, q)$, is transformed into a plane-element, defined by $(x, y, p, q, 0)$, which belongs to the surface-element; and a transformation of $x, y, p, q, 0$ unchanged transforms the $x^2$, line-elements, in space of $3$ dimensions, into a point on a curve; while two curves which touch are transformed into two other curves which touch. One of the simplest instances of a contact-transformation is that can be obtained by the transformation $x = y, y = x$. By this transformation a point $P$ and a plane $P'$ are transformed into a plane $P'$ and a point $P$ upon it; i.e., the surface-element defined by $x, x$, $p, q$, $p, q$, is changed into a definite surface-element defined by $p^2$, $q^2$. The totality of surface-elements which belong to a non-developable surface is known from geometrical considerations to be changed into the totality which belongs to another (non-developable) surface. On the other hand, the totality of the surface-elements which belong to a curve is changed into another set which belong to a developable. The analytical formulation for this transformation is the following:

$$x' = x + (x + p)q, y' = y + (y + q)p, z' = z + (z + q)p,$$
$$g' = g + (g + q)p,$$
The same limitations on $a$, $b$, $c$, the totality of the substitutions (ii) forms a simply isomorphic continuous group of order 3, which is generated by the two infinitesimal transformations

$$\begin{align*}
a & = \frac{\partial}{\partial x} + a_0 \frac{\partial}{\partial y} + a_1 \frac{\partial}{\partial \zeta}, \\
b & = \frac{\partial}{\partial y} + b_0 \frac{\partial}{\partial y} + b_1 \frac{\partial}{\partial \zeta}, \\
c & = \frac{\partial}{\partial \zeta} + c_0 \frac{\partial}{\partial y} + c_1 \frac{\partial}{\partial \zeta},
\end{align*}$$

and

$$\begin{align*}
n & = \frac{\partial}{\partial x} + (n-1) \frac{\partial}{\partial y} + (n-2) a_0 \frac{\partial}{\partial y} + \ldots + a_{n-1} \frac{\partial}{\partial \zeta}. \\
\end{align*}$$

The invariants of the binary form, i.e., those functions of the coefficients which are unaltered by all homogeneous substitutions of the variables, are in general identical with the functions of the coefficients which are invariant for the continuous group generated by the two infinitesimal operations last written. In other words, they are given by the common solutions of the differential equations

$$\begin{align*}
\frac{\partial}{\partial x} + a_0 \frac{\partial}{\partial y} + a_1 \frac{\partial}{\partial \zeta} & = 0, \\
\frac{\partial}{\partial y} + b_0 \frac{\partial}{\partial y} + b_1 \frac{\partial}{\partial \zeta} & = 0, \\
\frac{\partial}{\partial \zeta} + c_0 \frac{\partial}{\partial y} + c_1 \frac{\partial}{\partial \zeta} & = 0, \\
\frac{\partial}{\partial x} + (n-1) \frac{\partial}{\partial y} + (n-2) a_0 \frac{\partial}{\partial y} + \ldots + a_{n-1} \frac{\partial}{\partial \zeta} & = 0.
\end{align*}$$

Both this result and the method by which it is arrived at are well known, but the point of view by which we pass from the transformation group of the variables to the isomorphic transformation group of the coefficients, and regard the invariants as invariants rather of the group than of the forms, is a new and a fruitful one.

The general theory of curvature of curves and surfaces may in a similar way be regarded as a theory of their invariants for the group of motions. Thus the ordinary equation of the curvature is in fact implied here will be evident in dealing with minimum curves, i.e., with curves such that at every point of them $dx^2 + dy^2 + dz^2 = 0$. For such curves the ordinary theory of curvature has no meaning, but their properties have invariant properties in regard to the group of motions.

The curvature and torsion of a curve, which are invariant for all transformations by the group of motions, are special instances of what are known as differential invariants. If $x_0$, $y_0$, $z_0$ is the general infinitesimal transformation of a group of point-transformations in the plane, and if $y_1$, $y_2$, $y_3$ represent the successive differential coefficients of $y_0$, then the infinitesimal transformation may be written in the extended form

$$\begin{align*}
x & = x_0 + \eta_1 y_0 + \eta_2 y_1 + \eta_3 y_2 + \ldots, \\
y & = y_0 + \eta_1 y_1 + \eta_2 y_2 + \ldots, \\
z & = z_0 + \eta_1 y_1 + \eta_2 y_2 + \ldots.
\end{align*}$$

where $\eta_1$, $\eta_2$, $\eta_3$, are the increments of $y_1$, $y_2$, $y_3$. By including a sufficient number of these variables the group must be transitive in them, and must therefore have one or more invariants. Such invariants are known as differential invariants of the original group, being necessarily functions of the differential coefficients of the original variables. For groups of the second order it may be shown that not more than two of these differential invariants are independent, all others being formed from these by algebraical processes and differentiation. For groups of point-transformations in more than two variables the number of differential invariants may be any whole number.

For instance, with three variables, one may be regarded as independent and the other two as functions of it, or as independent and the remaining one as a function. Corresponding to these invariants, the differential invariants for a curve or for a surface will arise.

If a differential invariant of a continuous group of the plane be equal to zero, then the remaining equation remains unaltered when the variables undergo any transformation of the group. Conversely, if an ordinary differential equation $F(x, y, y_1, y_2, \ldots) = 0$ admits the transformations of a continuous group, i.e., if the equation is unaltered when $x$ and $y$ undergo any transformation of the group, then $F(x, y, y_1, y_2, \ldots)$ or some multiple of it must be a differential invariant of the group. Hence it must be possible to find two independent differential invariants of the group, such that when these are taken as variables the differential equation takes the form

$$F(a, b, \partial a, \partial b, \ldots) = 0.$$ 

This equation in $a$, $b$ will be of lower order than the original equation, and in general simpler to deal with. Supposing it solved in the form $b = a(x, y)$, where for their values in terms of $x$, $y$, $y_1$, $y_2$, $\ldots$ are written, this new equation, containing arbitrary constants, is necessarily again of lower order than the original equation. The integration of the original equation is thus divided into two steps. This will show that in the ordinary differential equation, the fact that the equation admits a continuous group of transformations may be taken advantage of for its integration.

The most important of the applications of continuous groups are to the theory of systems of differential equations, both ordinary and partial; in fact, Lie states that it was with a view to systematizing and advancing the purely geometrical methods of the integration that he was led to the development of the theory of continuous groups. It is quite impossible here to give any account of all that Lie and his followers have done in this direction. An entirely new mode of regarding the problem of the integration of a differential equation has been opened up, and in the classification that arises from it all those apparently isolated types of equations which in the older sense are said to be integrable take their proper place. It may, for instance, be remarked that the distinction of whether Monge's method of application to the integration of a partial differential equation is of the second order is shown to depend on whether or not a contact-transformation can be found which will reduce the equation to either $\frac{\partial^2 z}{\partial x \partial y} = 0$ or $\frac{\partial^2 z}{\partial y^2} = 0$. It is in this direction that further advance in the theory of partial differential equations must be looked for. Lastly, it may be remarked that one of the most thorough discussions of the axioms of geometry hitherto undertaken is founded entirely upon the theory of continuous groups.

**Discontinuous Groups.**

We go on now to the consideration of discontinuous groups. Although groups of finite order are necessarily contained under this general head, it is convenient for many reasons to deal with them separately, and it will therefore be assumed in the present section that the number of operations in the group is not finite. Connected classes of discontinuous groups have formed the subject of detailed investigation, but a general formal theory of discontinuous groups can hardly be said to exist as yet. It will thus be obvious that in considering discontinuous groups it is necessary to proceed on different lines from those followed with continuous groups, and in fact to deal with the subject almost entirely by way of example.

The consideration of a discontinuous group as arising from a set of auxiliary or generating transformations, and its determination by a certain form, of view in which any two simply isomorphic groups are indistinguishable. The number of generating operations may be either finite or infinite, but the former case alone will be here considered. Suppose then that $S_1, S_2, \ldots, S_n$ is a set of independent operations from which a group $G$ is generated. The general operation of the group will be represented by the symbol $S_{a_1} S_{a_2} \ldots S_{a_n}$ or $S_\Sigma$, where $a_1, a_2, \ldots, a_n$ are chosen from $1, 2, \ldots, n$. When $a_1 = a_2 = \ldots = a_n$, the operation is clearly $S_\Sigma^0 = 1$; and unless $a_1 = a_2 = \ldots = a_n = a_1, a_2, \ldots, a_n = b_1, b_2, \ldots, b_n$, this is a relation connecting the generating operations and the identity operation, every distinct symbol $\Sigma$ represents a distinct operation of the group. For if $\Sigma = a_1 S_{a_2} \ldots S_{a_n} = a_2 S_{a_1} S_{a_3} \ldots S_{a_n} = \ldots = S_{a_1} S_{a_2} \ldots S_{a_n}$, then $S_\Sigma = 1$; by the law of composition of its operations apart from their actual form, by a set of generating operations and a system of relations connecting them. Conversely, when such a set of operations and system of relations are given arbitrarily they define in abstraction form a single discontinuous group. It may, of course, happen that the group so defined is a group of finite order, or that it reduces to the identical operation only; but in general these will be particular and exceptional cases.

An operation of a discontinuous group must necessarily be specified analytically by a system of equations of the form

$$x' = f_1(x_1, \ldots, x_n; a_0, a_1, \ldots, a_n), \quad y' = f_2(x_1, \ldots, x_n; a_0, a_1, \ldots, a_n), \quad \ldots,$$

and the different operations of the group will be given by different sets of values of the parameters $a_0, a_1, \ldots, a_n$.

No one of these parameters is inherently susceptible of continuous variations, but at least one must be capable of taking a number of values which is not finite, if the group is not one of finite order. Among the sets of values of the parameters there must be one which gives the identical transformation. No other transformation makes each of the differences $x' - x_1, x'_2 - x_2, \ldots, x'_n - x_n$ vanish. Let $d$ be an arbitrary assigned positive quantity. Then if a transformation of the group can be found such that the modulus of each of these differences is less than $d$ when the variables have arbitrary values within an assigned range of variation, however small $d$ may be, the operation is said to be continuous; otherwise it is discontinuous. In the contrary case the group is called properly discontinuous. The range within which the variables are allowed to vary may clearly affect the question whether a given group is properly or improperly discontinuous. For instance, the group
defined by the equation $x'=ax+b$, where $a$ and $b$ are any rational numbers, is improperly discontinuous; and the group defined by $x'=ax+b/ab$, that is, the group of the one-dimensional conformal group, is a subset of the group defined by $x'=ax+b$, and is improperly discontinuous when the range of $x$ is limited to real values.

Among the discontinuous groups that occur in analysis, a large number may be regarded as arising by imposing limitations on the range of variation of the parameters of continuous groups. If $x'=f(x)$ where $x$ and $y$ are integers satisfying the relation $ad-bc=1$, is improperly discontinuous when the range of $x$ is limited to any of the integers, while the group defined by $x'=f(x) + c$, where $c$ is an integer, is improperly discontinuous when the range of $x$ is limited to any of the integers.

Linear discontinuous groups.

A most important class of groups with continuous linear transformations is the group in a given set of variables. For such a group, the $x$ and $y$ of a set of differentiable functions of $a$ and $b$ are arbitrary rational numbers, and the $s$ and $t$ of the functions are arbitrary rational numbers. If the $s$'s and $t$'s are rational numbers, then the $s$'s are integers and the $t$'s are integers of the same group, though the $s$'s and $t$'s are not integers of the $s$'s and $t$'s.

The determinant $c$ is the product of the determinant of the $s$'s and $t$'s, and the determinant of the $s$'s and $t$'s is the product of the determinant of the $t$'s and $s$ of the determinant of the $s$'s and $t$'s. Equations (ii), which follow on the subject of linear groups, are defined for a discontinuous group; and if the determinant of the coefficients is limited to the value unity, they define a discontinuous group which is a self-conjugate subgroup of the previous one.

For a group in which there are two variables and the coefficients are rational integers, this group is defined by the equations

$$\begin{align*}
x' &= ax+by, \\
y' &= cx+dy,
\end{align*}$$

where $a$, $b$, $c$, $d$ are integers such that $ad-bc=1$. To every operation of this group there corresponds an operation of the set defined by

$$\begin{align*}
x' &= z+\alpha, \\
y' &= z+\beta,
\end{align*}$$
in such a way that the product of two operations of the group, then corresponds to the product of these operations of the set. The operations of the set (iv), where $ad-bc=1$, therefore constitute a group which is isomorphic with the previous group. The isomorphism is multiple, since any two operations of the second set correspond to an isomorphic operation of the first set; and $a$, $b$, $c$, $d$, and $s$, $t$, $o$, $n$ are arbitrary integers. These two groups, which are of fundamental importance in the theory of quadratic forms and in the theory of modular functions, have been the object of very many investigations.

Another large class of discontinuous groups, which have far-reaching applications in analysis, are those which arise in the first instance from purely geometrical considerations, and by repetition of a finite number of geometrical operations such as translations, projective transformations, inversions, &c., a discontinuous group of such operations will arise. Such a group may be regarded as a group of points of the plane (or of space), will in general be improperly discontinuous; but when the generating operations are suitably chosen and are not properly discontinuous. In the latter case the group may be represented in a geometrical form by the division of the plane (or space) into regions such that no point of one region can be transformed into any other point of the same region by any operation of the group, while any given region can be transformed into any other by a suitable transformation. Thus, let $ABC$ be a triangle bounded by the arcs $AB$, $BC$, and $CA$, and let $ABC'$ be a triangle bounded by the arcs $A'B'$, $B'C'$, and $C'A'$, and let $ABC$ be congruent to $ABC'$ by inversion in the three circles of which $BC$, $CA$, $AB$ are arcs. By inversion at $B$, $ABC$ becomes an equilateral triangle $ABC$. An inversion of $ABC$ changes $ABC$ and $A'B'C'$ into equilateral triangles. By repeated inversion of $ABC'$ about $AB$, $BC$, and $CA$, we then change $ABC$ into a series of equilateral triangles with $B$ for a common vertex. These will not overlap and will fill in the space between the sides of which $AB$ is a submultiple of two right angles (or zero). If then the angles of $ABC$ are submultiples of two right angles (or zero), the triangles formed by any number of inferences will never overlap, and to each operation consisting of a definite series of inferences at $BC$, $CA$ and $AB$ will correspond a distinct triangle into which $ABC$ is changed by the operation. The network of triangles so formed gives a graphical representation of the group that arises from the three inferences at $BC$, $CA$, $AB$. The triangles may be divided into two sets, those that are even and those that are odd. Each set may be regarded as a new group of discontinuous functions of $a$ and $b$, and $c$ and $d$ of the group $ABC$ by an even number of inferences, and those like $A'B'C'$ produced by an odd number. Each set is interchanged among themselves by any even number of inferences. Hence the operations of the group correspond to an even number of inversions at $B$, $C$, and $A$, and these regions clearly do not overlap. Their distribution represents a geometrical form the group that arises by pairs of inferences at $B$, $C$, $A$, and $B$; and this group is generated by the operation which consists of successive inferences at $B$, $C$, $A$, $B$, $C$, $A$, and this group is a group of discontinuous functions at $B$, $C$, $A$. The group defined thus geometrically may be presented in many analytical forms. For $x$, $y$, and $x'$, $y'$ are the rectangular coordinates of two sets of points which are in inverse to each other with respect to a given circle, $x'$ is the point to which $x$, $y$, and $z$ are connected by a linear relation $z'=ax+b$. Where $a$, $b$, $c$, $d$ are constants, a (general complex) depending on the circle at which the inversions are taken. Hence the group as presented in the form of a group of linear transformations of a single variable is generated by the two linear transformations $\begin{align*}
x' &= ax+by, \\
y' &= cx+dy,
\end{align*}$ which correspond to the group of inferences at $B$, $C$, and $BC$, respectively. In particular, if the sides of the triangle are taken to be $x=0$, $y=0$, $x+y=1$ then $x'=x+y$, $y'=x-y$, and $x'=x^2+y^2$, and $y'=x^2-y^2$, which is that consisting of all transformations of the form $x'=2x-y$, where $ad-bc=1, a, b, c, d$ being integers.

This is the group already mentioned which underlies the theory of the elliptic modular functions; a modular function being a function of $z$ which is invariant for some subgroup of finite index of the group in question.

The triangle $ABC$ from which the above geometrical construction started may be replaced by a polygon whose sides are circles. If each angle is a submultiple of two right angles or zero, the construction hence the group presented in the form of a geometrical form the group that arises from the three inferences at the sides of the polygon. In their analytical form, as groups of linear transformations of a single variable, the groups are those on which the theory of automorphic functions depends. A similar construction in space, the polygons bounded by circular arcs being replaced by polyhedra bounded by spherical faces, has been used by F. Klein and Fricke to give a geometrical representation for groups which are improperly discontinuous when represented as groups of the plane.

The special classes of discontinuous groups that have been dealt with in the previous paragraphs arise from considerations. As a final example we shall refer briefly to a class of groups whose origin is essentially analytical. Let

$$\begin{align*}
x' &= \alpha x+\beta y, \\
y' &= \gamma x+\delta y,
\end{align*}$$
be a linear differential equation, the coefficients in which are rational functions of $x$, and let $y_1, y_2, \ldots, y_n$ be a linearly independent set of integrals of the equation. In the neighbourhood of a finite value $x_0$ of $x$, which is not a singularity of any of the coefficients in the equation, these integrals are ordinary power-series in $x-x_0$. If the analytical continuations of $y_1, y_2, \ldots, y_n$ be formed for any closed path starting from and returning to $x_0$, the final values arrived at at $x_0$ again reached will be another set of linearly independent integrals. When the closed path contains no singular point of the coefficients of the differential equation, the new set of integrals is identical with the original set. If, however, the closed path encloses one or more singular points, the values of the integrals will then be different. Let $y_1', y_2', \ldots, y_n'$ be the new integrals arrived at. Since in the neighbourhood of $x_0$ each integral can be represented linearly in terms of $y_1, y_2, \ldots, y_n$, there must be a system of equations

$$\begin{align*}
y_1' &= a_1 y_1 + a_{12} y_2 + \cdots + a_{1n} y_n, \\
y_2' &= a_{21} y_1 + a_{22} y_2 + \cdots + a_{2n} y_n, \\
&\vdots \\
y_n' &= a_{n1} y_1 + a_{n2} y_2 + \cdots + a_{nn} y_n,
\end{align*}$$

where the $a$'s are constants, expressing the new integrals in terms of the original ones. To each closed path described by $x_0$ there therefore corresponds a definite linear substitution performed on the $y$'s. Further, if $S_1$ and $S_2$ are the substitutions that correspond to two closed paths, then the composition of the two paths will be continuously deformed, without crossing a singular point, into itself, followed by $L$, there corresponds the substitution $S_2S_1$. Let $L_1, L_2, \ldots, L_n$ be arbitrarily chosen closed paths starting from and returning to the same point, and each of them enclosing a single one of the
(r) finite singular points of the equation. Every closed path in the plane can be formed by combinations of these r paths taken either in the positive or in the negative direction. Also a closed path which does not cut itself, and encloses all the r singular points within it, is equivalent to a path enclosing the point at infinity and no finite singular point. Hence, if to these r open paths correspond to these r paths, then the substitution corresponding to every possible path can be obtained by combination and repetition of these r substitutions, and they therefore generate a discontinuous group each of whose members is the equivalence of a single finite closed path. The group thus arrived at is called the group of the equation. For a given equation it is unique in type. In fact, the only effect of starting from another set of independent integrals is to transform every operation of the group by an isomorphism, while choosing a different set of paths is equivalent to taking a new set of generating operations. The great importance of the group of the equation lies in the fact that while the algebraic form of the equation may not be dealt with, but it may be pointed out that if all the integrals of the equation are algebraic functions, the group must be a group of finite order, since the set of quantities q1, q2, . . . , qn can then only take a finite number of distinct values.

Groups of Finite Order.

We shall now pass on to groups of finite order. It is clear that here we must have to do with properties which have no direct analogues in the theory of continuous groups or in that of discontinuous groups in general; those properties, namely, which depend on the fact that the number of distinct operations in the group is finite.

Let S1, S2, S3, . . . , Sn denote the operations of a group G of finite order N, Sn being the identical operation. The tableau

| S1 | S2 | S3 | . . . | Sn |
|----|----|----|      |----|
| S1 | S2 | S3 | . . . | Sn |
| S2 | S3 | S4 | . . . | Sn |
| . . . | . . . | . . . |     | . . . |
| Sn | Sn | Sn | . . . | Sn |

when in each compound symbol SnSn is replaced by the single symbol Sn, indicates that it is an operation of the group. It indicates directly the result of multiplying together in an assigned sequence any number of operations of the group. In each line (and in each column) of the tableau every operation of the group occurs once and only once. If the letters in the tableau are regarded as mere symbols, the operation of replacing each symbol by the first line by the symbol which stands under it in the ith line is a permutation performed on the set of N symbols. Thus to the N lines of the tableau there corresponds a set of N permutations performed on the N symbols, which includes the identical permutation that leaves each unchanged. Moreover, if S1S2 = S3, then the result of carrying out in succession the operations S1, S2 results in a given group from a given one. These lines give the permutation which corresponds to the ith line. Hence the set of permutations constitutes a group which is simply isomorphic with the given group.

Note: The symbol symbols S1S2 . . . Sn can therefore be represented in concrete form as a transitive group of permutations on N symbols. The order of any subgroup or operation of G is necessarily finite. If T1 = (S1, S2, . . . , Sn) are the operations of the subgroup H of G, the order of H is simply the number of distinct operations of T1, and if H is an operation of G which is not contained in H, the order of H is simply the number of H in H. The set of operations T1T2 . . . Tn, or 2H, are all distinct from each other and from the operations of H. If the sets H and 2H do not exhaust the operations of G, the order of G must therefore be a factor of the order of H. The symbol H is the called the index of the subgroup H. By taking H the cyclical subgroup generated by any one of the elements of H, it follows that the order of S must be a factor of the order of G.

Every operation S is permutable with its own powers. Hence there must be some subgroup H of G of greatest possible order such that every operation of H is permutable with S. Every operation of H transforms S into itself, and every operation of the set S transforms S into the same operation. Hence, when S is transformed by every operation of G, just N/r distinct operations arise if r' is an operation not belonging to them, then the operations of the set S are distinct from each other and from those of H. This process may be continued till the operations of G are exhausted. The number r of S must be a factor of the order of G.

Properties of an operation which depend on the order.

Every operation S is permutable with its own powers. Hence there must be some subgroup H of G of greatest possible order such that every operation of H is permutable with S. Every operation of H transforms S into itself, and every operation of the set S transforms S into the same operation. Hence, when S is transformed by every operation of G, just N/r distinct operations arise if r' is an operation not belonging to them, then the operations of the set S are distinct from each other and from those of H. This process may be continued till the operations of G are exhausted. The number r of S must be a factor of the order of G.

An Abelian group contains subgroups whose orders are any given factors of the order of the group. In fact, since every subgroup H of an Abelian group G and the corresponding factor group H/G are Abelian, this result follows immediately by an induction from the preceding theorem. In particular, if H contains n+1 elements, then H contains p+1. For group which is Abelian, no general law can be stated as to the existence or non-existence of a self-conjugate operation isomorphic to the order of the group. In this connexion the most important general result, which is independent of any supposition as to the order of the group, is known as Sylow's theorem, which states that if a group contains a power of p and if the order of the group is a power of p, then contains a subgroup of order p n. Thus, if H contains p+1 elements, then H contains p+1. If, however, p+1 is not the highest power of p which divides the order, these groups do not in general form a single conjugate set.

The structure of a group is determined in the following way. If the order of a group is a power of p, then contains a subgroup H of order p+1. The same is true for a group of order p+1. Then for an order operation is the product p, of two primes (p < p) must have a self-conjugate subgroup of order p, of the order of the group contains no other factor, other than unity, of the form p+1. The isomorphisms of the group of a given order need hardly be insisted on. Thus, as a very simple instance, a group whose order is the product of two primes (p, q) must have a self-conjugate subgroup of order q, since the order of the group contains no other factor, other than unity, of the form q+1. The same is true for a group of order p+q, unless p = 2, and q = 3.

There is one other numerical property of a group connected with its order which is quite general. If N is the order of G, and n a factor of N, the number of operations of G, whose orders are equal to or factors of n, is a multiple of n. Such a group is said to be permutable, or to have a self-conjugate operation isomorphic to the order of G. In general it is not unique, since a group may have two or more maximum self-conjugate subgroups. A composition-series of a group is a series of subgroups G_1, G_2, . . . , G_n, such that each is a maximum self-conjugate subgroup of the preceding; the last term of the series consisting of the identical operation only. Such a series is called a composition-series of G. The number of terms of which it consists is always the same, while the factor-groups G_1, G_2, . . . , G_n differ only in the sequence in which they occur. It should be noticed that though a group defines uniquely only one composition-series in its class, there can be different series of factor-groups do not conversely in general define a single type of group. When the orders of all the factor-groups are the prime the group is said to be soluble.

If the sets S, H, K, . . . , L, 1 is chosen so that each is the greatest self-conjugate subgroup of G contained in the previous one, the series is called a chief composition-series of G. All such series of subgroups are of course not equivalent, and in their different forms gives the number of terms, and to give rise to the same set of factor-groups, except as regards sequence. The factor-groups such a series will not, however, necessarily be simple groups. From any chief composition-series of G it is possible to form another series between any two terms H and K of the series for which H/K is not a simple group, a number of terms h_n, h_{n-1}, . . . , h_1; and it may be possible to introduce new terms into the composition-series H_1, H_2, . . . , H_n. An isomorphism of the group with itself, established in this way, is called an inner isomorphism. It may be regarded as an operation carried out on the symbols of the operations, being indeed a permutation performed on these symbols. The totality of these operations clearly constitutes a group isomorphic with the given group, and this group is called the group of inner isomorphisms. The group itself is called a group of simper operations isomorphic according as it does not or does contain self-conjugate operations other than identity. It may be possible to establish a correspondence between the operations of a group other than those giving rise to the inner isomorphisms, such as if S is the operation corresponding to S, then S^* = S. The substitution on the symbols of the operations of a group resulting from such a correspondence is called an outer isomorphism. The totality of the isomorphisms of both kinds constitutes the group of isomorphisms of the given group, and within this the group of inner isomorphisms is a self-conjugate subgroup. Every set of conjugate subgroups of the operation G is a self-conjugate subgroup, while two or more sets may be interchanged by an outer isomorphism.

A subgroup of a group G, which is transformed into itself by every isomorphism of G, is called a characteristic subgroup. A series of groups G_1, G_2, . . . , G_n, such that each is a maximum characteristic subgroup of G contained in the preceding, may be shown to have the same invariant properties as the subgroups of a composition series, and is called a composition-series of G. A group which has no characteristic subgroup must be either a simple
GROUPS, THEORY OF

635
group or the direct product of a number of simply isomorphic subgroups.

It has been seen that every group of finite order can be represented as a group of permutations performed on a set of symbols whose number is equal to the order of the group. In general such a representation is possible in many ways. Let \( H \) be a subgroup of \( G \), and let the operations of \( G \) be divided, in respect of \( H \), into the sets \( H \), \( S_H \), \( S_S \), \( S_H , \ldots , S_S H \), \( S_S H \), \( S_S H , \ldots , S_S H \) differ from the previous sets only in the sequence in which they occur. In fact, if \( S_S \) belong to the set \( S_S H \) then since \( H \) is a group, the set \( SS_H \) is identical with the set \( S_H \). Hence, to each operation \( S \) of \( G \) there corresponds a permutation performed on the symbols of the \( m \) sets, and to the product of two operations corresponds the product of the two analogous permutations.

The set of permutations, therefore, forms a group isomorphic with \( G \) when the operation between any two members is the composition for one or more operations, other than identity, the sets all remain unaltered. This can only be the case for \( S \) when every operation constituting \( S \) belongs to \( H \). In this case \( H \) would form a self-conjugate subgroup, and the isomorphism is multiple.

The fact that every group of finite order can be represented, generally in several ways, as a group of permutations, gives special importance to such cases. The number of symbols involved in such a representation is called the degree of the group. In accordance with the general definitions already given, a permutation-group is called transitive or homogeneous if it can be shown that it does, or does not, change the permutations changing any one of the symbols into any other. It is called imprimitive or primitive according as the symbols can or cannot be arranged in sets, such that every permutation of the group changes the symbols of one set to the symbols of another set, but leaves the symbols of a third set unaltered. If one is to be the case for \( G \), then the group will be said to be a group of permutations, changing the symbols of a certain set and not the symbols of another set. When a group is imprimitive the number of symbols in each set must clearly be the same.

The number of permutations that can be performed on \( n \) symbols is \( n! \), a number of considerable magnitude. It is known as the symmetric group of degree \( n \), the only rational functions of the symbols which are unaltered by all possible permutations being the symmetric functions. When any permutation is carried out on the product of the \( n(n-1)/2 \), differences of the \( n \) symbols, it must either remain unaltered or its sign must be changed. Those permutations which leave the product unaltered constitute a group of order \( n/2 \), which is called the alternating group of degree \( n \). It is a self-conjugate subgroup of the symmetric group. Except when \( n=4 \), the alternating group is a simple group. A group of degree \( n \), which is not contained in a permutation group of degree \( n \) containing \( n \) of its elements which are not permutations of the symbols of a group of index 2, consisting of those of its permutations which belong to the alternating group.

Among the various concrete forms in which a group of finite order can be represented, the most important is that of a group of linear substitutions. Such groups have already been referred to in connection with discontinuous groups. Here the number of distinct substitutions is necessarily finite, and to each operation \( S \) of \( G \) a group of finite order there will correspond a linear substitution \( x \), viz.

\[
x_1 = \sum_{j=1}^{m} x_j t_j, \\
x_2 = \sum_{j=1}^{m} x_j t_j, \\
\ldots, \\
x_m = \sum_{j=1}^{m} x_j t_j
\]

on a set of \( m \) variables, such that if \( ST = U \) then \( ST = U \). The linear substitutions \( s, t, u, \ldots \) thus constitute a group with \( G \) which is isomorphic; and whether the isomorphism is simple or multiple \( g \) is said to be "induced" by \( G \). The group of linear substitutions is a group of finite order, as can be shown that a group of linear substitutions, of finite order, is always either irreducible, or such that the variables, when suitably chosen, may be divided into sets, each set being irreducibly transformed among themselves. This being so, it is clear that when \( G \) is irreducible the group of linear substitutions of a group of finite order are known, all representations may be built up.

A group of linear substitutions on \( m \) variables is said to be "reducible" when it is possible to choose \( m \) \( (\leq n) \) linear functions of the variables which are transformed among themselves by every substitution of the group. When this cannot be done the group is called "irreducible." It can be shown that a group of linear substitutions, of finite order, is always either irreducible, or such that the variables, when suitably chosen, may be divided into sets, each set being irreducibly transformed among themselves. This being so, it is clear that when \( G \) is irreducible the group of linear substitutions of a group of finite order is known, all representations may be built up.

It has been seen at the beginning of this section that every group of finite order can be represented as a group of linear substitutions in a simple sense. Linear groups. This group is obviously reducible; in fact, the sum of the symbols remains unaltered by every substitution of the group. The fundamental theorem of the case, which the writer believes is new, is that a group of linear substitutions, of a group of finite order is the following.

If \( r \) is the number of different sets of conjugate operations in the group, then, when the group of \( N \) permutations is completely reduced, (i.) just \( r \) distinct irreducible representations occur:

(ii.) each of these occurs a number of times equal to the number of symbols on which it operates.

(iii.) these irreducible representations exhaust all the distinct irreducible representations of the group.

Among these representations what is called the "identical" representation necessitates the group \( G \) is finite in which each operation of the group corresponds to leaving a single symbol unchanged. If these representations are denoted by \( \Gamma_1, \Gamma_2, \ldots, \Gamma_r \), then any representation of the group \( G \) is, for substitutions, or in particular as a group of permutations, may be uniquely represented by a symbol \( \Sigma \), \( \Gamma_i \), in the sense that the representation when completely reduced will contain the representation \( \Gamma_i \) just \( a_i \) times for each \( a_i \).

A representation of a group of finite order as an irreducible group of linear substitutions may be presented in an infinite number of equivalent forms. If \( \Gamma_i \) is a group of finite order such that

\[
\sum_{j=1}^{m} x_j t_j = n \times o_i \times y_i
\]

is invariant for all equivalent representations, when written as a polynomial in \( \lambda \). Moreover, it has the same value for \( S \) and \( S' \), if these are two operations in \( G \). Of the various invariants which thus arise the most important is \( S_1 S_2 + \ldots + S_m \), which is called the characteristic of the representation, and which is characteristic is the sum of \( m \) \( l \)-th roots of unit; and in particular, if \( S \) is the characteristic or its characteristic is \( m \). If \( r \) is the number of irreducible representations of \( G \), the corresponding representation of \( G \) as an irreducible group, a set of \( r \) characteristics, \( X_1, X_2, \ldots, X_r \), one corresponding to each conjugate set; so that for the \( r \) irreducible representations just \( r \) such sets of characteristics arise. These are distinct and in the sense that if \( \lambda_1, \lambda_2, \ldots, \lambda_r \) are the characteristics of a distinct representation from the above, then \( \lambda_1, \lambda_2, \ldots, \lambda_r \) are not equal for all the values of the suffix \( x \). It may be the case that the \( r \) characteristics for a given representation are all real. If this is so the representation is real, and is, in the sense that it is self-conjugate. In the contrary case there is always another representation, called the "inverse" representation, for which each characteristic is the conjugate imaginary of the corresponding one in the original representation. The characteristics are subject to certain remarkable relations. If \( p_2 \) denotes the number of operations in the \( p \)-th conjugate set, while \( X_1, X_2, \ldots, X_r \) are the characteristics of the \( p \)-th conjugate set in \( \Gamma_1, \Gamma_2 \), then

\[
\sum_{j=1}^{m} p_j X_j = n \times o_i \times y_i
\]

according to \( \Gamma_1, \Gamma_2 \), and are not or are inverse representations, \( \pi \) being the order of \( G \).
constitutes a group of order \( p^m \). This class of groups for various values of \( p \) always has been of special interest, as each group is a group of finite order. For all values of \( p \) except 3 it contains a simple self-conjugate subgroup of index 2.

A great extension of the theory of linear homogeneous groups has been made in recent years by considering systems of congruences of the form

\[
x_1 = a_{11} x_1 + a_{12} x_2 + \ldots + a_{1m} x_m + \epsilon_1 \quad (r = 1, 2, \ldots, m),
\]

in which the coefficients \( a_{ij} \) are integral coefficients with real integral coefficients of a root of an irreducible congruence to a prime modulus. Such a system of congruences is represented by the equation to a normal form.

The chief application of the theory of these equations is to the theory of algebraic equations. The analogy of equations of the second, third, and fourth degrees would give rise to the expectation that a root of an equation of any finite degree can be expressed by radicals of its coefficients, the number of the operations of addition, subtraction, multiplication, division, and the extraction of roots; in other words, that the equation can be solved by radicals. This, however, is not the case: an equation of a higher degree than the fourth in general defines an algebraic irrationality which cannot be expressed by means of radicals, and the cases in which such an equation can be solved by radicals must be regarded as exceptional.

The theory of groups gives the means of determining whether an equation comes under this exceptional case, and of solving the equation when it does. When it does not, the theory provides the means of enumerating and classifying the solutions of the equations, which defines a group which contains as a subgroup the group defined by the equation to the normal form. From this point of view the theory of equations of the fifth degree has been exhaustively treated, and the problems presented by equations of the sixth and seventh degrees have actually been reduced to normal form.

Galois (see Equation) showed that, corresponding to every irreducible equation of the 6th degree, there exists a transitive substitution-group of degree 6, such that the equations, the numerical value of which is unaltered by all the substitutions of the group, can be expressed rationally in terms of the coefficients, while others, however, which is not rationally in terms of the coefficients is unaltered by the substitutions of the group. This group is called the group of the equation. In general, if the equation is given arbitrarily, the group will be the symmetric group. For each irrationality that an equation may be solvable by radicals is that its group should be a solvable group. When the coefficients in an equation are rational, the determination of its group may be made by a finite number of processes each of which involves only rational arithmetic operations. These processes consist in forming resolvents of the equation corresponding to each distinct type of subgroup of the symmetric group whose degree is that of the equation. Each of the resolvents so formed is then examined to find whether it has rational roots. The group corresponding to any resolvent which has a rational root contains the group of the equation; and the least of the groups so obtained is the group to which the equation belongs. When the equation is of the fifth degree the various transitive subgroups of the symmetric group of degree five have to be considered. These are (i) the alternating group; (ii) a soluble group of order 12; (iii) a cyclic group of order 5, self-conjugate in both the preceding; (iv) a group of order 15; (v) the function \( x_1 x_2 x_3 x_4 x_5 \); (vi) the function \( x_1 x_2 + x_3 x_4 + x_5 \); (vii) the function \( x_1 x_2 + x_3 x_4 + x_5 \); (viii) the function \( x_1 x_2 + x_3 x_4 + x_5 \); and (ix) the function \( x_1 x_2 + x_3 x_4 + x_5 \).

Since the groups for which (iii), (iv), and (v) are invariant are contained in that for which (ii), (vi), and (vii) are, it follows that the only soluble groups of the set, the equation will be soluble by radicals only when the function (ii) can be expressed rationally in terms of the coefficients. If the function (ii) of the equation is irreducible, the equation is to be solved by radicals.

The solution of reducing an equation of the fifth degree, when not possible by radicals, was accomplished first by Abel, and then by Galois. The theory of solvable groups has been described in the article Algebraic Equations.

The word "species" may in this case be used advisedly (since the red grous e invariably "breeds true," it admits of an easy diagnosis, and it has a definite geographical range); but scarcely any zoologist can doubt of its common origin with the willow-grouse, Lagopus albus (L. salpinus or L. saliceti of some authors), that inhabits a subarctic zone from Norway across the

A summary with many references will be found in the Jahresbericht der mathe matischen Wissenschaften (Leipzig, vol. 1, 1880, 1896).

---

GROUSE, a word of uncertain origin, now used generally by ornithologists to include all the "rough-footed" Gallinaceous birds, but in common speech applied almost exclusively, when used alone, to the Tetrao scoticus of Linnaeus, the Lagopus scoticus of modern systematists—more particularly called in English the red grouse, but till the end of the 18th century almost invariably spoken of as the Moor-fowl or Moor-game.

The effect which this species had on the British legions in the late Middle Ages, and therefore on history, is well known, for it was the common belief that parliament always rose when the season for grouse-shooting began (August 12th); while according to the Orkneyinga Saga (ed. Jonacus, p. 356; ed. Anderson, p. 165) events of some importance in the annals of North Britain followed from its pursuit in Caithness in the year 1517.

The red grouse is found on moors from Monmouthshire and Derbyshire northward to the Orkneys, as well as in most of the Hebrides. It inhabits similar situations throughout Wales and Ireland, but it does not naturally occur beyond the limits of the British isles. It is distinguished from the above species by its smaller size, lighter plumage, and more pleasing effect.

It is said to have originated from Gastrochaenus gallicus or Porphyrio minor, the "red grous e," which is a small bird of the French provinces, and is frequently found in heath and moorland. It is found in the Peiser's dictionary under the name "grous e," and is said to be a bird of "cleverness," "shrewdness," and "wit." It is the most likely derivation to be from the old French word grous e, grue ge or grue (meaning speckled, and cognate with grieseis, grisy or grey), which was applied to some kind of game, and was used for the grous e, as the English word "poule" is for the French "poule.

The most likely derivation seems to be from the old French word grous e, grue ge or grue (meaning speckled, and cognate with grieseis, grisy or grey), which was applied to some kind of game, and was used for the grous e, as the English word "poule" is for the French "poule."
continents of Europe and Asia, as well as North America from the Aleutian Islands to Newfoundland. The red grouse indeed is rarely or never found away from the heather on which chiefly it subsists; while the willow-grouse in many parts of the Old World seems to prefer the shrubby growth of berry-bearing plants (Vaccinium and others) that, often thickly interspersed with willows and birches, clothes the higher levels or the lower mountain-slopes, and it flourishes in the New World where heather scarcely exists, and a "heath" in its strict sense is unknown. It is true that the willow-grouse always becomes white in winter, which the red grouse never does; but in summer there is a considerable resemblance between the two species, the cock willow-grouse having his head, neck and breast of nearly the same rich chestnut-brown as his British representative, and, though his back be lighter in colour, as is also the whole plumage of his mate, than is found in the red grouse, in other respects the two species are precisely alike. No distinction can be discovered in their voice, their eggs, their build, nor in their anatomical details, so far as these have been investigated and compared. Moreover, the red grouse, restricted as is its range, varies in colour not inconsiderably according to locality.

Though the red grouse does not, after the manner of other members of the genus Lagopus, become white in winter, Scotland possesses a species of the genus which does. This is the ptarmigan, _L. mutus_ or _L. alpinus_, which differs far more in structure, station and habits from the red grouse than does from the willow-grouse, and in Scotland is far less abundant, haunting the highest and most barren mountains. It is said to have formerly inhabited both Wales and England, but there is no evidence of its appearance in Ireland. On the continent of Europe it is found most numerously in Norway, but at an elevation far above the growth of trees, and it occurs on the Pyrenees and on the Alps. It also inhabits northern Russia.

Grouse. 637

In North America, Greenland and Iceland it is represented by a very nearly allied form—so much so indeed that it is only at certain seasons that the slight difference between them can be detected. This form is the _L. rupestris_ of authors, and it would appear to be found also in Siberia (Ibis, 1879, p. 148). Spitzbergen is inhabited by a large form which has received recogni-
GROVE, SIR G.—GRUB

generally throughout Scotland, though not in Orkney, Shetland or the Outer Hebrides, nor in Ireland. On the continent of Europe it has a very wide range, and it extends into Siberia. In Georgia its place is taken by a distinct species, on which a Polish naturalist (in 1806, by J. F. Berkenhout, p. 267) has confused the name of T. melanosuwzici. Both these birds have much in common with their larger congener the capercaillie and its eastern representative.

The species of the genus Bonasa, of which the European B. sylvestris is the type, does not inhabit the British Islands. It is perhaps the most delicate game-bird that comes to table. It is the gelinote of the French, the Haselkühn of Germans, and Hjerpar of Scandinavians. Like its transatlantic congener B. umbellus, the ruffled grouse or birch-partridge (of which there are two hard local forms, B. umbellolides and B. subulinus), it is purely a forest-bird. The same may be said of the species of Canace, of which two forms are found in America, C. canadensis, the spruce-partridge, and C. franklini, and also of the Siberian C. fuliginosis. Nearly allied to these birds is the group known as Dendragapus, containing three large and fine forms D. obscurus, D. fuliginosus, and D. richardsoni—all peculiar to North America. Then there are Centrocercus urophasianus, the sage-cock of the plains of Columbia and California, and Pediceps, the sharp-tailed grouse, with its two forms, P. phasianellus and P. columbianus, which latter is sometimes considered a separate species. The commonest of these, C. cupido and C. politidicincta, is a bird that in the United States of America possesses considerable economic value, enormous numbers being consumed there, and also exported to Europe.

The various sorts of grouse are nearly all figured in Elliot's Monograph of the Tetraonimae, and an excellent account of the American species is given in Baird, Brewer and Ridgway's North American Birds (iii. 444-465). See also SHOOTING. (A. N.)

GROVE, SIR GEORGE (1820-1900), English writer on music, was born at Clapham on the 13th of August 1820. He was articled to a civil engineer, and worked for two years in a factory near Glasgow. In 1841 and 1842 he was employed in the West Indies, erecting lighthouses in Jamaica and Bermuda. In 1845 he became secretary to the Society of Arts, and in 1852 to the Crystal Palace. In this capacity his natural love of music and enthusiasm for the art found a splendid opening, and he threw all the weight of his influence into the task of promoting the best music of all schools in connexion with the weekly and daily concerts at Sydenham, which had a long and honourable career under the direction of Mr. (afterwards Sir) August Manns. Without Sir George Grove that eminent conductor would hardly have succeeded in doing what he did to encourage young composers and to educate the British public in music. Among the analyses of the Beethoven symphonies, and the other works presented at the concerts, set the pattern of what such things should be; and it was as a result of these, and of the fact that he was editor of Macmillan's Magazine from 1868 to 1883, that the scheme of his famous Dictionary of Music and Musicians, published from 1878 to 1880 (new edition, edited by J. A. Fuller Maitland, 1904-1907), was conceived and executed. His own articles in that work on Beethoven, Mendelssohn and Schubert are monuments of a special kind of learning, and that the rest of the book is a little thrown out of balance owing to their great length is hardly to be regretted. Long before this he had contributed to the Dictionary of the Bible, and had promoted the foundation of the Palestine Exploration Fund. On a journey to Vienna, undertaken in the company of his lifelong friend, Sir Arthur Sullivan, the important discovery of a large number of compositions by Schubert was made, including the music to Rosamunde. When the Royal College of Music was founded in 1882 he was appointed its first director, receiving the honour of knighthood. He brought the new institution into line with the most useful European conservatories. In the completion of the new buildings in 1894 he resigned the directorship, but retained an active interest in the institution to the end of his life. He died at Sydenham on the 28th of May 1900.

His life, a most interesting one, was written by Mr. Charles Graves. (J. A. F. M.)

GROVE, SIR WILLIAM ROBERT (1811-1896), English judge and man of science, was born on the 11th of July 1811 at Swansea, South Wales. After being educated by private tutors, he went to Bekenhead College; Oxford was the place he took in the University degree in 1832. Three years later he was called to the bar at Lincoln's Inn. His health, however, did not allow him to devote himself strenuously to practice, and he occupied his leisure with scientific studies. About 1839 he constructed the platinum-zinc voltaic cell that bears his name, and with the aid of a number of these exhibited the electric arc light in the London Institution, Finsbury Circus. The result was that in 1840 the managers appointed him to the professorship of experimental philosophy, an office which he held for seven years. His researches dealt very largely with electro-chemistry and with the voltaic cell, of which he invented several varieties. One of these, the Grove gas-battery, which is of special interest both intrinsically and as the forerunner of the secondary batteries now in use for the "storage" of electricity, was based on his observation that a current is produced by a couple of platinum plates standing in acridulated water and immersed, the one in hydrogen, the other in oxygen. At one of his lectures at the Institution he anticipated the electric lighting of to-day by illuminating the theatre with incandescent electric lamps, the filaments being of platinum and the current supplied by a battery of his nitric acid cells. In 1866 he presided over the British Association at its Nottingham meeting and delivered an address on the continuity of natural phenomena. But while he was thus engaged in scientific research, his legal work was not neglected, and his practice increased so greatly that in 1853 he became a Q.C. One of the best-known cases in which he appeared as an advocate was that of William Palmer, the Rugeley poisoner, whom he defended. In 1871 he was made a judge of the Common Pleas in succession to Sir Robert Collier, and remained on the bench till 1887. He died in London on the 1st of August 1896.

The completion of his work by Dr. Ayre in his 11th edition of The Correlation of Physical Forces, published in 1874.

GROVE (O.E. graf, c.f. O.E. grafa, brushwood, later "grave"; the word does not appear in any other Teutonic language, and the New English Dictionary finds no Indo-European root to which it can be referred; Skeat considers it connected with "grave," to cut, and finds the original meaning to be a blade cut through a wood), a small group or cluster of trees, growing naturally and forming something smaller than a wood, or planted in particular shapes or for particular purposes, in a park, &c. Groves have been connected with religious worship from the earliest times, and in many parts of India every village has its sacred group of trees. For the connexion of religion with sacred groves see TREE-WORSHIP.

The word "grove" was used by the authors of the Authorized Version of the Bible to translate two Hebrew words: (1) גָּרֶשׁ , as in Gen. xxii, 33, and I Sam. xxii, 18; this is rightly given in the Revised Version as "tamarisk"; (2) אֶשֶּרֶךְ in many places throughout the Old Testament. Here the translators followed the Septuagint ἄστρον and the Vulgate lucus. The "ashrek" was a tree or a grove, the place of assembly, and also by the altars of Yahweh. It may have represented a tree.

GROZNYI, a fortress and town of Russia, North Caucasus, in the province of Terek, on the Zunzha river, 82 m. by rail N.E. of Vladikavkaz, on the railway to Petrovsk. There are naphtha wells close by. The fortifications were constructed in 1819. Pop. (1897) 15,590.

GRUB, the larva of an insect, a caterpillar, maggot. The word is formed from the verb "to grub," to dig, break up the
surface of the ground, and clear of stumps, roots, weeds, &c. According to the New English Dictionary, "grub" may be referred to an ablaut variant of the Old Teutonic "grab", to dig, cf. "grave." Skeat (Etym. Dict. 1898) refers it rather to the root seen in "grop", "grab," &c., the original meaning "to search for." The earliest quotation of the slang use of the word in the sense of food in The New English Dictionary is dated 1690 from Ancient Poems, Ballads, &c., Percy Society Publications. Grubb-street," as a collective term for needy hack-writers, dates from the 17th century and is due to the name of a street near Moorfields, London, now Milton Street, which was as Johnson says "much inhabited by writers of small histories, dictionaries and temporary poems."

GRUBER, JOHANN GOTTFRIED (1774-1854), German critic and literary historian, was born at Naumburg on the Saale, on the 20th of November 1774. He received his education at the town school of Naumburg and the university of Leipzig, after which he resided successively at Göttingen, Leipzig, Jena and Weimar, occupying himself partly in teaching and partly in various literary enterprises, and enjoying in Weimar the friendship of Herder, Wieland and Goethe. In 1811 he was appointed professor at the university of Wittenberg, and after the division of Saxony he was sent by the senate to Berlin to negotiate the union of the university of Wittenberg with that of Halle. After the union was effected he became in 1815 professor of philosophy at Halle. He was associated with Johann Samuel Ersch in the editorship of the great work Allgemeine Encyklopädie der Wissenschaften und Künste; and after the death of Ersch he continued the first section from vol. xvii. to vol. liv. He also succeeded Ersch in the editorship of the Allgemeine Literaturzeitung. He died on the 7th of August 1851.

Gruber was the author of a large number of works, the principal of which are Charakteristick Herders (Leipzig, 1805), in conjunction with Johann T. L. Danz (1769-1851), afterwards professor of theology at Jena; Geschichte des menschlichen Geschlechts (2 vols., Leipzig, 1806); Wörterbuch der altklassischen Mythologie (3 vols., Weimar, 1810-1815); Wielands Leben (2 parts, Weimar, 1815-1816); and Klopfsteck's Leben (Weimar, 1832). He also edited Wieland's Schriften in 3 vols., 1818-1819.

GRUMBACH, WILHELM VON (1503-1567), German adventurer, chiefly known through his connexion with the so-called "Grumbach feuds" (Grumbachschen Händel), the last attempt of the German knights to destroy the power of the territorial princes. A member of an old Franconian family, he was born on the 1st of June 1503, and having passed some time at the court of Casimir, prince of Bayreuth (d. 1527), fought against the peasants during the rising in 1524 and 1525. About 1540 Grumbach became associated with Albert Alcibiades, the turbulent prince of Bayreuth, whom he served both in peace and war. After the conclusion of the peace of Passau in 1552, Grumbach was appointed by Albert of the Palatinate, and was thus able to take some revenge upon his enemy, Melchior von Zobel, bishop of Würzburg. As a landholder Grumbach was a vassal of the bishops of Würzburg, and had held office at the court of Conrad of Bibra, who was bishop from 1540 to 1544. When, however, Zobel was chosen to succeed Conrad the harmonious relations between lord and vassal were quickly disturbed. Unable to free himself and his associates from the suzerainty of the bishop by appealing to the imperial courts he decided to adopt more violent measures, and his friendship with Albert was very serviceable in this connexion. Albert's career, however, was checked by his defeat at Sievershausen in July 1553 and his subsequent flight into France, and the bishop took advantage of this state of affairs to seize Grumbach's lands. The knight obtained an order of restitution from the imperial court of justice (Reichskammergericht), but he was unable to carry this into effect; and in April 1558 some of his partisans seized and killed the bishop. Grumbach declared he was innocent of this crime, but his story was not believed, and he fled to France. Returning to Germany he pleaded his cause in person before the diet at Augsburg in 1559, but without success. Meanwhile he had found a new patron in John Frederick, duke of Saxony, whose father, John Frederick, had been obliged to surrender the electoral dignity to the Albertine branch of his family. Chafing under this deprivation the duke listened readily to Grumbach's plans for recovering the lost dignity, including a general rising of the German knights and the deposition of Frederick II., king of Denmark. Magical charms were employed against the duke's enemies, and communications from angels were invented which helped to stir up the zeal of the people. In 1563 Grumbach attacked Würzburg, seized and plundered the city and compelled the chapter and the bishop to restore his lands. He was consequently placed under the imperial ban, but John Frederick refused to obey the order of the emperor Maximilian II. to withdraw his protection from him. Meanwhile Grumbach sought to compass the assassination of the Saxong elector, Augustus; proclamations were issued calling for assistance; and alliances both without and within Germany were concluded. In November 1566 John Frederick was placed under the ban, which had been renewed against Grumbach earlier in the year, and Augustus marched against Gotha. Its ruins (all of the Roman period) include those of a large amphitheatre (arena 205 by 197 ft.), the only one in Luxemia, except that at Paestum. There are also remains of a theatre. Inscriptions record the repair of its town walls and the construction of thermae (of which remains were found) in 57-51 b.c., the construction in 43 b.c., of a portico, remains of which may be seen along an ancient road, at right angles to the main road, which traversed Grumentum from S. to N.

See F. Ortoloff, Geschichte der Grumbachschen Händel (Jena, 1868-1870), and J. Voigt, Wilhelm von Grumbach und seine Händel (Leipzig, 1846-1847).

GRUMENTUM, an ancient town in the centre of Lucania, 33 m. S. of Potentia by the direct road through Anxia, and 52 m. by the Via Herculis, at the point of divergence of a road eastward to Herculane. It seems to have been a native Lucanian town, not a Greek settlement. In 215 B.C. the Carthaginian general Hanno was defeated under its walls, and in 207 B.C. Hannibal made it his headquarters. In the Social War it appears as a strong fortress, and seems to have been held by both sides at different times. It became a colony, perhaps in the time of Sulla, at latest under Augustus, and seems to have been of some importance. Its site, identified by Holste from the description of the martyrdom of St Lavernus, is a ridge on the right bank of the Aciris (Agri) about 1560 ft. above sea-level, ¾ m. below the modern Saponara, which lies much higher (2533 ft.). Its ruins (all of the Roman period) include those of a large amphitheatre (arena 205 by 197 ft.), the only one in Lucania, except that at Paestum. There are also remains of a theatre. Inscriptions record the repair of its town walls and the construction of thermae (of which remains were found) in 57-51 b.c., the construction in 43 b.c., of a portico, remains of which may be seen along an ancient road, at right angles to the main road, which traversed Grumentum from S. to N.

GRÜN. HANS BALDUNG (c. 1470-1545), commonly called Grün, a German painter of the age of Dürer, was born at Grün in Swabia, and spent the greater part of his life at Strasbourg and Freiburg in Breisgau. The earliest pictures assigned to him are altar-pieces with the monogram H. B. interlaced, and the date of 1496, in the monastery chapel of Lichtenthal near Baden. Another early work is a portrait of the emperor Maximilian, drawn in 1521 on a leaf of a sketch-book now in the print-room at Carlshue. The "Martyrdom of St Sebastian" and the "Epiphany" (Berlin Museum), fruits of his labour in 1507, were painted for the market-church of Halle in Saxony. In 1500 Grün purchased the freedom of the city of Strasbourg, and resided there till 1513, when he moved to Freiburg in Breisgau. There he began a series of large compositions, which he finished in 1516, and placed on the high altar of the Freiburg cathedral. He purchased anew the freedom of Strasbourg in 1517, resided in that city as his domicile, and died a member of its great town council 1545.

Though nothing is known of Grün's youth and education, it may be inferred from his style that he was no stranger to the school of which Dürer was the chief. Grün is but 50 m. distant on either side from Augsburg and Nuremberg. Grün's prints were often mistaken for those of Dürer; and Dürer himself was well acquainted with Grün's woodcuts and
During these years he was preaching against rationalism to an enthusiastic congregation in Copenhagen, but he accepted in 1821 the country living of Præstø, only to return to the metropolis the year after. In 1825 he published a pamphlet, The Church's Reply, against H. N. Clausen, who was professor of theology in the University of Copenhagen. Grundtvig was publicly prosecuted and fined, and for seven years he was forbidden to preach, years which he spent in publishing a collection of his theological works, in paying two visits to England, and in studying Anglo-Saxon. In 1832 he obtained permission to preach again, and in 1839 he became priest of the workhouse church of Vartov hospital, Copenhagen, a post he continued to hold until his death. In 1837-1841 he published Songs for the Danish Church, a rich collection of sacred poetry; in 1838 he brought out a selection of early Scandinavian verse; in 1840 he edited the Anglo-Saxon poem of the Phoenix, with a Danish translation. He visited England a third time in 1843. From 1844 until after the first German war Grundtvig took a very prominent part in politics. In 1867 he received the titular rank of bishop, but without a see. He went on writing occasional poems till 1866, and preached in the Vartov every Sunday until a month before his death. His preaching attracted large congregations, and he soon had a following. His hymn-book effected a great change in Danish church services, substituting the hymns of the national poet for the slow measures of the orthodox Lutherans. The chief characteristic of Grundtvig was the substitution of the authority of the "living word" for the apostolic commentaries, and he desired to see each congregation a practically independent community. His patriotism was almost a part of his religion, and he established popular schools where the national poetry and history should form an essential part of the instruction. His followers are known as Grundtvigians. He was married three times, the last time in his seventy-sixth year. He died on the 2nd of September 1872. Grundtvig holds a unique position in the literature of his country; he has been styled the Danish Shakespeare and is generally regarded as the country's poet-par excellence. The form and the forcefulness of his writings, which have had a great influence over his own countrymen, is hardly agreeable or intelligible to a foreigner. The best of his poetical works were published in a selection (7 vols., 1880-1889) by his eldest son, Svend Herslev Grundtvig (1824-1883), who was an authority on Scandinavian antiquities, and made an admirable collection of old Danish poetry (Danmarks gamle Folketviser, 1853-1883, 5 vols.; completed in 1891 by A. Orlit). His correspondence with Ingemann was edited by S. Grundtvig (1882); his correspondence with Christian Molebech by L. Schöder (1888); see also F. Winckel Horn, Grundtvigs Læs og Gerning (1883); and an article by F. Nielsen in Bricka's Dansk Biografisk Lexikon.
GRUNDY, MRS.-GRUYÈRE

Delacour. Others were A Village Priest (Haymarket, 1890) from Le Secret de la terreure, a melodrama by MM. Bussach and Coudert, and Jacobite Sagacity of God (haymarket, 1807) from Un Mariage de Louis XV, by Alex. Dumas, père, The Silver Key (Her Majesty's, 1897) from his Mlle de Belle-Isle, and The Musqueteers (1890) from the same author's novel; Frocks and Friills (Haymarket, 1902) from the Doigts de fées of MM. Scribe and Legouvé; The Garden of Lies (St James's, Theatre, 1904), from Mr Justus Miles Forman's novel; Business is Business (His Majesty's Theatre, 1905), a rather free adaptation from Octave Mirbeau's Les Affaires sont les affaires; and The Diplomatists (Royalty Theatre, 1905) from La Poudre aux yeux, by A. Arnoux.

GRUNDY, MRS., the name of an imaginary English character, who typifies the disciplinary control of the conventional "proprieties" of society over conduct, the tyrannical pressure of the opinion of neighbours on the acts of others. The name appears in a play of Thomas Morton, Speed the Plough (1708), in which one of the characters, Dame Ashfield, continually refers to what her neighbour Mrs Grundy will say as the criterion of respectability. Mrs Grundy is not a character in the play, but is a kind of "Mrs Harris" to Dame Ashfield.

GRUNER, Jan, 1680-1761, was pastor of Trachselsdorf, in the Bernese Emmental (1705), and later (1725) of Burgdorf, and a great collector of information relating to historical and scientific matters; his great Thesaurus topographico-historicus tostis ditionis Bernensis (4 vols. folio, 1729-1730) still remains in MS., but in 1732 he published a small work entitled Deliciae orbis Bernae, while he possessed an extensive cabinet of natural history objects. Naturally such tastes had a great influence on the mind of his son, Justus Grundy, who was born at Trachselsdorf, and educated by his father and at the Latin school at Burgdorf, not going to Berne much before 1736, when he published a dissertation on the use of fire by the heathen. In 1739 he qualified as a notary, in 1741 became the archivist of Hesse-Homburg, and in 1743 accompanied Prince Christian of Anhalt-Schaumburg to Silesia and the university of Halle. He returned to his native land before 1749, when he obtained a post at Thorberg, being transferred in 1764 to Landshut and Fraubrunnen. It was in 1760 that he published in 3 vols. at Berne his chief work, DiePrivateKeyer, and his large Polychromed Bueren, translated by M. de Kéralio, Paris, 1770. The first two volumes are filled by a detailed description of the snowy Swiss mountains, based not so much on personal experience as on older works, and a very large number of communications received by Gruner from numerous friends; the third volume deals with glaciers in general, and their various properties. Though in many respects imperfect, Gruner's book sums up all that was known on the subject in his day, and forms the starting-point for later writers. The illustrations are very curious and interesting. In 1778 he republished (nominally in London, really at Berne) much of the information contained in his larger work, but thrown into the form of letters, supposed to be written in 1776 from various spots, under the title of Reisen durch die merkwürdigsten Gegenden Helvetiens (2 vols.).

GRUÉ, W. A. B. C.

GRÜNEWALD, MATTHIAS. The accounts which are given of this German painter, a native of Aschaffenburg, are curiously contradictory. Between 1518 and 1530, according to statements adopted by Waagen and Passavant, he was commissioned by Albert of Brandenburg, elector and archbishop of Mainz, to produce an altarpiece for the collegiate church of St Maurice and St Mary Magdalene at Hallo on the Saale; and he acquitted himself of this duty with such cleverness that the prelate in after years caused the picture to be rescued from the Reformers and brought back to Aschaffenburg. From one of the churches of that city it was taken to the Pinakothek of Munich in 1836. It represents St Maurice and Mary Magdalene between four saints, and displays a style so markedly characteristic, and so like that of Lucas Cranach, that Waagen was induced to call Grünewald Cranach's master. He also traced the same hand and technical execution in the great altarpieces of Annaberg and Heilbronn, and in various panels exhibited in the museums of Mainz, Darmstadt, Aschaffenburg, Vienna and Berlin. A later race of critics, declining to accept the statements of Waagen and Passavant, affirm that there is no documentary evidence to connect Grünewald with the pictures of Halle and Annaberg, and they quote Sandrart and Bernhard Jobin of Strassburg to show that Grünewald is the painter of pictures of a different class. They prove that he finished before 1516 the large altarpiece of Issenheim, at present in the museum of Colmar, and state that if those premises they connect the artist with Altdorfer and Dürrer to the contrary. It is certain that Dürrer and his Palatinate should have been asked to execute pictures for a church in Saxony can scarcely be accounted strange, since we observe that Hans Baldung (Grün) was entrusted with a commission of this kind. But that a painter of Aschaffenburg should display the style of Cranach is strange and indeed incredible, unless vouched for by first-class evidence. In this case documents are altogether wanting, whilst on the other hand it is beyond the possibility of doubt, even according to Waagen, that the altarpiece of Issenheim is the creation of a man whose teaching was for a greater part of the time that of Cranach of Halle and Annaberg. The altarpiece of Issenheim is a fine and powerful work, completed as local records show before 1516 by a Swabian, whose distinguishing mark is that he followed the traditions of Martin Schongauer, and came under the influence of Altdorfer and Dürrer. As a work of art the altarpiece is important, being a polypych of eleven panels, a carved central shrine covered with a double set of wings, and two side pieces containing the Temptation of St Anthony, the hermits Anthony and Paul in converse, the Virgin adored by Angels, the Resurrection, the Anunciation, the Crucifixion, St Sebastian, St Anthony, and the Marys wailing over the dead body of Christ. The author's name is also the painter of a series of monochromes described by Sandrart in the Dominican convent, and now in part in the Salzhof at Frankfort, and a Resurrection in the museum of Basel, registered in Ameurbach's inventory as the work of Grünwald.

GRUTER (or GRUYÈRE), JAN (1560-1627), a critic and scholar of Dutch parentage by his father's side and English by his mother's, was born at Antwerp on the 3rd of December 1560. To avoid religious persecution he was sent young by his parents to England; and for some years he prosecuted his studies at Cambridge, after which he went to Leiden, where he graduated M.A. In 1586 he was appointed professor of history at Wittenberg, but as he refused to subscribe the formula concordiae he was unable to retain his office. From 1589 to 1592 he taught at Rostock, after which he went to Heidelberg, where in 1602 he was appointed librarian to the university. He died at Heidelberg on the 20th of September 1627.

Gruuter's chief works were his Inscriptions antiquae totius orbis Romanii (2 vols., Heidelberg, 1603), and Lampas, sive fax aratum liberalium (7 vols., Frankfort, 1602-1634).

GRUYÈRE (Ger. Gresser), a district in the south-eastern portion of the Swiss canton of Fribourg, famed for its cattle and its cheese, and the original home of the "Ranz des Vaches," the melody by which the herdsmen call their cows home at milking time. It is composed of the middle reach (from Montbovon to beyond Bulle) of the Sarine or Saane valley, with its tributary glens of the Hongrin (left), the Jogne (right) and the Trême (left), and is a delightful pastoral region (in 1901 it contained 17,364 cattle). It forms an administrative district of the canton of Fribourg, its population in 1900 being 25,111, mainly French-speaking and Romansians. From Montbovon (11 m. by rail from Bulle) there are mountain railways leading S.W. past Les Avants to Montreux (14 m.), and E. up the Sarine valley past Château d'Oex to Saanen or Gesseny (14 m.), and by a tunnel below a low pass to the Simme valley and Speiez on the Lake of Thun. The modern capital of the district is the small town of Bulle [Ger. Boll], with a 13th-century castle and in 1900 3330 inhabitants, French-speaking and Romansians.
the historical capital is the very picturesque little town of
Gruyères (which keeps its final "e" in order to distinguish it from
the district), perched on a steep hill (S.E. of Bulle) above the
left bank of the Sarine, and at a height of 2713 ft. above the
sea-level. It is only accessible by a rough carriage road, and
boats of a very fine old castle, at the foot of which is the solitary
street of the town, which in 1900 had 1382 inhabitants.

The castle was the seat of the counts of the Gruyère, who are
first mentioned in 1075. The name is said to come from the
word gruyer, meaning the officer of woods and forests, but the
counts bore the canting arms of a crane (grue), which are seen
all over the castle and the town. That valiant family ended
(in the legitimate line) with Count Michel (d. 1752) whose extra-
vagant and consequent indebtedness compelled him in 1555
to sell his domains to Bern and Fribourg. Bern took the upper
valley (it still keeps Saanen as its head), but in 1708 lost the
Pays d'En-Haut to the canton of the Léman, which in 1803
became the canton of Vaud). Fribourg took the rest of the
county, which it added to Bulle and Albeuve (taken in 1537
from the bishop of Lausanne), and to the lordship of Jaun in the
Jaun or Jogne valley (bought in 1592-1594 from its lords), in order
to form the present administrative district of Gruyère, which is
not co-extensive with the historical county of that name.

1908).

(W. A. B. C.)

GRYNAEUS, or GRYNER, JOHANN JAKOB (1540-1617),
Swiss Protestant divine, was born on the 1st of October 1540
at Bern. His father, Thomas (1512-1564), was for a time professor
of ancient languages at Basel and Bern, and afterwards became
pastor of Röteln in Baden. He was the nephew of the more eminent
Simon Grynaeus (p. n.), who was educated at the University of Heidelberg. Returning to Basel
in 1559 he received an appointment as curate to his father. In 1563 he proceeded to Tübingen for the purpose of completing his theo-
logical studies, and in 1565 he returned to Röteln as successor to
his father. Here he felt compelled to abjure the Lutheran
doctrine of the Lord's Supper, and to renounce the formula concordiae.

Called in 1575 to the chair of Old Testament
exegesis at Basel, he became involved in unpleasant controversy with Simon Sulzer and other champions of Lutheran orthodoxy;
and in 1584 he was glad to accept an invitation to assist in the
restoration of the university of Heidelberg. Returning to Basel
in 1586, after Simon Sulzer's death, as assistant or superintendent
of the church there and as professor of the New Testament, he
exerted for upwards of twenty-five years a considerable influence
upon both the church and the state affairs of that community,
and acquired a wide reputation as a skilful theologian of the
school of Ulrich Zwingli. Amongst other labours he helped to
reorganize the gymnasium in 1588. Five years before his death he
became totally blind, but continued to preach and lecture until his death on the 13th of August 1617.

His many works include commentaries on various books of the
Old and New Testament, Théologica theorematas et problemata (1588),
and a collection of patristic literature entitled Monumenta S. patrum
orthodoxorum (2 vols., fol., 1596-1598).

GRYNAEUS, SIMON (1492-1542), German scholar and theo-
logian of the Reformation, son of Jacob Gryner, a Swabian
peasant, was born in 1493 at Vehringen, in Hohenzelien-Sigmaringen. He adopted the name Grynaeus from the epitaph
of Apollo in Virgil. He was a schoolfellow with Melanchthon
at Pforzheim, whence he went to the university of Vienna, distinguishing himself there as a Latinist and Grecian. He
was appointed rector of a school at Buda was of no long con-
 tinuance; his views excited the zeal of the Dominicans and he
was thrown into prison. Gaining his freedom at the instance of
his schoolfellow masters, he visited Melanchthon at Wittenberg,
and in 1524 became professor of Greek at the university of
Heidelberg, being in addition professor of Latin from 1526.

His Zwinglian view of the Eucharist disturbed his relations with
his Catholic colleagues. From 1526 he had corresponded with
Oecolampadius, who in 1529 invited him to Basel, which Erasmus
had just left. The university being disorganized, Grynaeus
pursued his studies, and in 1531 visited England for research
in libraries. A commendatory letter from Erasmus gained him
the good offices of Sir Thomas More. He returned to Basel
charged with the task of collecting the opinions of continental
reformers on the subject of Henry VIII's divorce, and was
present at the death of Oecolampadius (Nov. 24, 1533). He
now, while holding the chair of Greek, was appointed extraordinary
professor of theology, and gave exegetical lectures on the
in aid of the reformation there, as well as for the reconstitution
of the university of Tübingen, which he carried out in concert with
Ambrosius Blarer of Constance. Two years later he had an active
hand in the so-called First Helvetic Confession (the work
of Swiss divines at Basel in January 1536); also in the conferences
which urged the Swiss acceptance of the Wittenberg Concord
(1536). At the Worms conference (1540) between Catholics
and Protestants he was the sole representative of the Swiss
churches, being deputed by the authorities of Basel. He
was carried off suddenly in his prime by the plague at Basel
on the 1st of August 1541. A brilliant scholar, a mediating theologian,
and personally of lovable temper, his influence was great and
widely exercised. Erasmus and Calvin were among his correspondents. His chief works were Latin versions of Plutarch,
Aristotle and Chrysostom.

His son SAMUEL (1539-1599) was professor of jurisprudence
at Wrocław. His nephew JOACHIM (1527-1564) was professor
at Basel and minister in Baden, and left four distinguished sons of
whom JOHANN JAKOB (1540-1617) was a leader in the religious
affairs of Basel. The last of the direct descendants of Simon
Grynaeus was his namesake SIMON (1725-1799), translator into
German of French and English anti-deistic works, and author of a
version of the Bible in modern German (1776).

diktionar (1899); and for bibliography, Streuber's S. Grynaeu-
histolote (1847).
GUACHARO—GUACO

Kirchofsgedanken (1636). His best works are his comedies, one of which, Absurda Comica, oder Herr Peter Squenta (1663), is evidently based on the comic episode of Pyramus and Thisbe in The Midsummer Night’s Dream. The best of these is the Tragedie Horribilibirtifrax (1663), founded on the Miles gloriosus of Plautus, is a rather laboured attack on pedantry. Besides these three comedies, Gryphius wrote five tragedies. In all of them his tendency is to become wild and bombastic, but he had the merit of at least attempting to work out artistically conceived plans, and there are occasional flashes both of passion and of imagination. His models seem to have been Seneca and Vondel. He had the courage, in Carolus Stuardus (1649) to deal with events of his own day; his other tragedies are Leo Armenius (1646); Katharina von Georgien (1657), Cardenio und Celinde (1657) and Papinius (1663). No German dramatic writer before him had risen to so high a level, nor had he worthy successors until about the middle of the 18th century.

A complete edition of Gryphius’s dramas and lyric poetry has been published by A. Kricke in the Kielische Klassiker Verein (3 vols., 1878, 1882, 1884). Volumes of selected works will be found in W. Müller’s Bibliothek der deutschen Dichter des 17ten Jahrhunderts (1826) and in Tripp’s Deutsche Dichter des 17ten Jahrhunderts (1870). There is also a good selection by H. Palm in Kurschner’s Deutsche Nationalliteratur. See O. Klopp, Andreas Gryphius als Dramatiker (1841); J. Herrmann, Andreas Gryphius der Dichter (1852); T. Wasserhofer, Beiträge zur Kenntniss von Andreas Gryphius’ Leben und Schriften (1876); J. Wysocki, Andreas Gryphius et la tragédie allemande au XVIIe siècle; and V. Mannheimer, Die Lyrik des Andreas Gryphius (1904).

GUACHARO (said to be an obsolete Spanish word signifying oil-bird, from which the name of the genus derives). It is a term of Spanish, and is a name of what English writers call the oil-bird, the Steatornis caripensis of ornithologists, a very remarkable bird, first described by Alexander von Humboldt (Voy. aux rég. équinoxiales i. 413, Eng. trans. iii. 119; Obs. Zoolog. ii. 141, pl. xiv.) from his own observation and from examples obtained by Aimé J. A. Bonpland, on the visit of those two travellers, in September 1799, to a cave near Caripé (at that time a monastery of Aragonese Capuchins) some forty miles S.E. of Cumaná on the northern coast of South America. A few years later it was discovered, says Latrobe (Proc. Hist. Birds, 1823, vii. 365), to inhabit Trinidad, and there it appears to bear the name of Diablotin; but by the receipt of specimens procured at Sarayacu in Peru, Cajamarca in the Peruvian Andes, and Antioquia in Colombia (Proc. Zool. Society, 1878, pp. 139, 140; 1879, p. 532), its range has been shown to be much greater than had been supposed. The singularity of its structure, its curious habits, and its pecuniary economical value have naturally attracted no little attention from zoologists. First referring it to the genus Caprimulgus, its original describer soon saw that it was no true goatcher. It was subsequently separated as forming a sub-family, and has at last been regarded as the type of a distinct family, Steatornithidae—a view which, though not put forth till 1870 (Zool. Record, vi. 67), seems now to be generally deemed correct. Its systematic position, however, can scarcely be considered settled, for though on the whole its predominating alliance may be with the Caprimulgidae, nearly as much affinity may be traced to the Strigidae, while it possesses some characters in which it differs from both (Proc. Zool. Society, 1873, pp. 326-353). About as big as a crow, its plumage exhibits the blended tints of chocolate-colour and grey, barred and pencilled with dun-crown and black, which prevail in the two families just named. The beak is hard, strong and deeply notched, the nostrils are prominent, and the gape is furnished with twelve long hairs on each side. The legs and toes are comparatively feeble, but the wings are large. In habits the guacharo is wholly nocturnal, slumbering by day in deep and dark caverns which it frequents in vast numbers. Towards evening it arouses itself, and, with croaking and clattering which has been likened to that of castanets, it approaches the exit of its retreat, whence at nightfall it issues in search of its food, which, so far as is known, consists entirely of insects, belonging especially to the genera Achras, Aiphanes, Laurus and Psychotria, some of them sought, it would seem, at a very great distance, for Funck (Bull. Acad. Sc. Bruxelles ii. pt. 2, pp. 371-377) states that in the stomach of one he obtained at Caripé he found the seed of a tree which he believed did not grow nearer than 80 leagues. The hard, indigestible seed swallowed by the guacharo are found in quantities on the floor and the ledges of the caverns it frequents, where many of them for a time vegetate, the plants thus growing being etiolated from want of light, and, according to travellers, forming a singular feature of the gloomy scene which these places present.

The guacharo is said to build a bowl-like nest of clay, in which it lays from two to four white eggs, with a smooth but lustreless surface, resembling those of some owls. The young soon after they are hatched become a perfect mass of fat, and while yet in the nest are sought by the Indians, who at Caripé, and perhaps elsewhere, make a special business of taking them and extracting the oil they contain. This is done about midsummer, when by the aid of torches and long poles many thousands of the young birds are slaughtered, while their parents in alarm and rage hover over them uttering the most degrading cries. The grease is melted over fires kindled at the cavern’s mouth, run into earthen pots, and preserved for use in cooking as well as for the lighting of lamps. It is said to be pure and limpid, free from any disagreeable taste or smell, and capable of being kept for a year without turning rancid. In Trinidad the young are esteemed a great delicacy for the table by many, though some persons object to their peculiar scent, which resembles that of a cockroach (Blatta), and consequently refuse to eat them. The old birds also, according to E. Taylor (Jour. for Orn., 1873, pp. 184-187; Goering, Vertebr. 1869, pp. 124-128; Murie, Jour. for Orn., 1873, pp. 81-86. (A. N.)

GUACO, Huaco or Guaco, also Vejucó and Bejuco, terms applied to various Central and South American and West Indian plants, in repute for curative virtues. The Indians and negroes of Colombia believe the plants known to them as guaco to have been so named after a species of kite, thus designated in imitation of its cry, which they say attracts to it the snakes that serve it principally for food; they further hold the tradition that their antilodal qualities were discovered through the observation that the birds eat of their leaves, and even spread the juice of the same on its wings, during contests with its prey. The disputes that have arisen as to what is “the true guaco” are to be attributed mainly to the fact that the names of the American Indians for all natural objects are generic, and their genera not always in coincidence with those of naturalists. Thus any twining plant with a heart-shaped leaf, white and green above and purple beneath, is called by them guaco (R. Spruce, in Howard’s Neua Quinolind, “Chinchona succirubra,” p. 22, note). What is most commonly recognized in Colombia as guaco, or Vejucó del guaco, would appear to be Mikania Guaco, or Vejucó (Blatt., dvd. 1809), a climbing Composite plant of the tribe Emparitoraeae, affecting moist and shady situations, and having a much-branched and deep-growing root, variegated, serrate, opposite leaves and dull-white flowers, in axillary clusters. The whole plant emits a disagreeable odour. It is stated that the Indians of Central America, after having “guazoned” themselves, i.e. taken guaco, catch with impunity the most dangerous snakes, which writh in their hands as though touched by a hot iron (B. Seemann, Hooker’s Journal of Bot. v. 76, 1855). The odour alone of guaco

1 Not to be confounded with the bird so called in the French Antilles, which is a petrel (Oestrida).
has been said to cause in snakes a state of stupor and torpidity; and Humboldt, who observed that the near approach of a rod steeped in guaco-juice was obnoxious to the venomous Coluber corallinus, was of opinion that inoculation with it imparts to the perspiration an odour which makes reptiles unwilling to bite. The drug is not used in modern therapeutics.

**GUADALAJARA**, an inland city of Mexico and capital of the state of Jalisco, 275 m. (direct) W.N.W. of the Federal capital, in lat. 20° 41' 10" N., long. 105° 21' 15" W. Pop. (1805) 83,034; (1900) 101,208. Guadalajara is served by a short branch of the Mexican Central railway from Italupato. The city is in the Antemarian College of the Rio Grande de Santiago, 5002 ft. above sea-level. Its climate is dry, mild and healthy, though subject to sudden changes. The city is well built, with straight and well-paved streets, numerous plazas, public gardens and shady promenades. Its public services include tramways and electric lighting, the Juanacatlán falls of the Rio Grande near the city furnishing the electric power. Guadalajara is an episcopal see, and its cathedral, built between 1577 and 1618, is one of the largest and most elaborately decorated churches in Mexico. The government palace, which like the cathedral is called the Capodiciense, is considered one of the finest specimens of Spanish architecture in Mexico. Other important edifices and institutions are the university, with its schools of law and medicine, the mint, built in 1811, the modern national college and high schools, a public library of over 28,000 volumes, an episcopal seminary, an academy of fine arts, the Teatro Degollado, and the large modern granite building of the penitentiary. There are many interesting Romanesque cathedrals and other conventual and secular buildings in the city. Charitable institutions of a high character are also prominent, among which are the Hospicio, which includes an asylum for the aged, infirm, blind, deaf and dumb, foundlings and orphans, a primary school for both sexes, and a girls' training school, and the Hospital de San Miguel de Belen, which is a hospital, an insane asylum, and a school for little children. One of the most popular public resorts of the city is the Paseo, a beautiful drive and promenade extending along both banks of the Rio San Juan de Dios for 1½ m. and terminating in the alameda, or public garden. The city has a good water-supply, derived from springs and brought in through an aqueduct 8 m. long. Guadalajara is surrounded by a fertile agricultural district and is an important commercial town, but the city is chiefly distinguished as the centre of the iron, steel and glass industries of Mexico. It is also widely known for the artistic pottery manufactured by the Indians of the city and of its suburb, San Pedro. Among other prominent industries are the manufacture of cotton and woolen goods, leather, furniture, hats and sweetmeats. Guadalajara was founded in 1531 by Nuño de Guzman, and became the seat of a bishop in 1549. The Calderon bridge near the city was the scene of a serious defeat of the revolutionists under Hidalgo in January 1811. The severe earthquake of the 31st of May 1818 partially destroyed the two cathedral steeples; and that of the 11th of March 1875 damaged many of the larger buildings.

The population includes large Indian and mestizo elements.

**GUADALAJARA**, a province of central Spain, formed in 1833 of districts taken from New Castile; bounded on the N. by Segovia, Soria and Saragossa, E. by Saragossa and Teruel, S. by Cuenca and W. by Madrid. Pop. (1900) 200,186; area, 4,076 sq. m. Along the northern frontier of Guadalajara rise the lofty Guadarrama mountains, culminating in the peaks of La Cebollera (6935 ft.) and Ocejon (6775 ft.); the rest of the province, apart from several lower ranges in the east, belongs to the elevated plateau of New Castile, and has a level or slightly undulating surface, which forms the upper basin of the river Tagus, and is watered by its tributaries the Tajaña, Henares, Jarama and Gallo. The climate of this region, as of Castile generally, is marked by the extreme severity of its winter cold and summer heat; the soil varies very much in quality, but is fertile enough in many districts, notably the cornlands of the Alcarria, towards the south. Few of the cork and oak forests which formerly covered the mountains have escaped destruction; and the higher tracts of land are mainly pasture for the sheep and goats which form the principal wealth of the peasantry. Grain, olive oil, wine, saffron, silk and flax are produced, but agriculture makes little progress, owing to defective communications and unscientific farming. In 1903, the only minerals worked were common salt and silver, and the total output of the mines was valued at $25,000. Deposits of iron, lead and gold also exist and were worked by the Romans; but their exploitation proved unprofitable when renewed in the 19th century. Trade is stagnant and the local industries are those common to almost all Spanish towns and villages, such as the manufacture of coarse cloth and pottery. The Madrid-Saragossa railway traverses the province for 70 m.; the roads are ill-kept and insufficient. Guadalajara (11,144) is the capital, and the only town with more than 4000 inhabitants; Molina de Aragon, a fortified town built at the foot of the Parameras de Molina (2500-3500 ft.), and on the right bank of the Gallo, a tributary of the Tagus, is of some importance as an agricultural centre. Siguénza, on the railway, is an episcopal city, with a fine Romanesque cathedral dating from the 12th century. It is probably the ancient Segusitza, founded in 219 B.C. by refugees from Carthage. The town, which still contains remains of the walls of the city, has a population of only 42 per sq. m., decreased slightly between 1870 and 1900, and extreme poverty compels many families to emigrate (see also CASTILE).

**GUADALAJARA**, the capital of the Spanish province of Guadalajara, on the left bank of the river Henares, and on the Madrid-Saragossa railway, 35 m. E.N.E. of Madrid. Pop. (1900) 11,144. Guadalajara is a picturesque town, occupying a somewhat sterile plain, 2100 ft. above the sea. A Roman aqueduct and the Roman foundations of the bridge built in 1758 across the Henares bear witness to its antiquity. Under Roman and Visigothic rule it was known as Arrisc or Caraca; its present name, which sometimes appears in medieval chronicles as Godafellre, represents the Vad-al-hajarah, or “Valley of Stones,” of the Moors, who occupied the town from 714 until 1081, when it was captured by Alvar Yáñez de Minaya, a comrade of the more famous Cid. The church of Santa Maria contains the image of the “Virgin of Battles,” which accompanied Alfonso VI. of Castile (1072-1109) on his campaigns against the Moors; and there are several other ancient and interesting churches in Guadalajara. St. Genel from the left of the province, which were the seat of the Bishop of Guadalajara. Under Spanish and Moorish rule it was called the Madjarafia style. The more important of these is the palace of the ducal house del Infantado, formerly owned by the Mendoza family, whose pentone, or mausoleum, added between 1666 and 1720 to the 18th-century church of San Francisco, is remarkable for the rich sculpture of its tombs. The town and provincial halls date from 1585, and the college of engineers was originally built by Philip V., early in the 18th century, as a cloth factory. Manufactures of soap, leather, woollen fabrics and bricks have superseded the original cloth-making industry for which Guadalajara was long celebrated; there is also a considerable trade in agricultural produce.

**GUADALQUIVIR** (ancient Baetis, Moorish Wadi al Kebrî, “the Great River”), a river of southern Spain. What is regarded as the main stream rises 4475 ft. above sea-level between the Sierra de Cazorla and Sierra del Poyo, in the province of Jaén. It does not become a large river until it is joined by the Guadiana Menor (Guadianamenor) on the left, and the Guadalimar on the right. Lower down it receives many tributaries, the chief being the Genil or Jendil, besides two tributaries, the chief being the Genil or Jendil, besides two tributaries. The general direction of the river is west by south, but a few miles above Seville it changes to south by west. Below Coria it traverses the series of broad fans known as Las Marismas, the greatest area of swamp in the Iberian Peninsula. Here it forms two subsidiary channels, the western 31 m., the eastern 12 m., which rejoin the main stream on the borders of the province of Cádiz. Below Sanlúcar the river enters the Atlantic after a total course of 360 m. It drains an area of 21,865 sq. m. Though the shortest of the great rivers of the peninsula, it is the only one which flows at all seasons.
with a full stream, being fed in winter by the rains, in summer by the melted snows of the Sierra Nevada. In the time of the Moors it was navigable up to Cordova, but owing to the accumulation of silt in its lower reaches it is now only navigable up to Seville by vessels of 1200 to 1500 tons.

GUADALOUPE-GUADET, a French colony in the West Indies, lying between the British islands of Montserrat on the N., and Dominica on the S., between 15° 59' and 16° 20' N. and 61° 31' and 61° 50' W. It consists of two entirely distinct islands, separated by a narrow arm of the sea, Rivière Salée (Salt river), varying from 100 ft. to 400 ft. in width and navigable for small vessels. The western island, a rugged mass of ridges, peaks and lofty uplands, is called Basse-Terre, while the eastern and smaller island, the real lowland, is known as Grande-Terre. A sinuous ridge runs through Basse-Terre from N. to S. In the north-west rises the peak of Grosse Montagne (2370 ft.), from which sharp spurs radiate in all directions; near the middle of the west coast are the twin heights of Les Mamelles (2536 ft. and 2368 ft.). Farther south the highest elevation is attained in La Soufrière (4900 ft.). In 1797 this volcano was active, and in 1843 its convulsions laid several towns in ruins; but a few thermal springs and solfataras existing vapoors now its only sign of volcanic activity. Termalism is an extreme south in the jagged peak of Carabil (2350 ft.). Basse-Terre is supremely beautiful, its cloud-capped mountains being clothed with a mantle of luxuriant vegetation. On Grande-Terre the highest elevation is only 450 ft., and this island is the seat of extensive sugar plantations. It consists of a plain composed mainly of limestone and a conglomerate of sand and broken shells known as macarine de bon dieu, much used for building. The bay between the two sections of Guadeloupe on the north is called Grand Cul-de-Sac Marin, that on the south being Petit Cul-de-Sac Marin. Basse-Terre (164 sq. m.) is 28 m. long by 12 m. to 15 m. wide; Grande-Terre (255 sq. m.) is 22 m. long from N. to S., of irregular shape, with a long peninsula, Chateaux Point, stretching from the south-eastern extremity. Basse-Terre is watered by a considerable number of streams, most of which in the rainy season are liable to sudden floods (locally called goliots), but Grande-Terre is practically destitute of springs, and the water-supply is derived almost entirely from ponds and cisterns.

The west half of the island consists of a foundation of old eruptive rocks upon which rest the recent accumulations of the granite and leucosomes, together with secondary deposits derived from the denudation of the older rocks. Grande-Terre on the other hand, consists chiefly of nearly horizontal limestones lying conformably upon a series of fine tufts and ashes, the whole belonging to the early part of the Tertiary system (probably Eocene and Oligocene). Occasional deposits of marl and limestone of late Pliocene age rest unconformably upon these older beds; and near the coast there are raised coral reefs of modern date.

The mean annual temperature is 78° F., and the minimum 61° F., and the maximum 101° F. From July to November heavy rains fall, the annual average on the coast being 86 in., while in the interior it is much greater. Guadeloupe is subject to terrible storms. In 1825 a hurricane destroyed the town of Basse-Terre, and Grand Bourg in Marie Galante suffered a like fate in 1865. The soil is rich and fruitful, sugar having long been its staple product. The other crops include cereals, cocoa, cotton, manioc, yams and rubber; tobacco, vanilla, coffee and bananas are grown, but in smaller quantities. Over 30% of the total area is under cultivation, and of this more than 50% is under sugar. The centres of this industry are St. Anne, Pointe-à-Pitre and Le Moule, where there are well-equipped usines, and there is also a large usine at Basse-Terre. The forests, confined to the island of Basse-Terre, are extensive and rich in valuable woods, but, being difficult of access, are not worked. Salt and sulphur are the only minerals extracted, and in addition to the sugar usines, there are factories for the making of rum, liquors, chocolate, besides fruit-canning works and tanneries. France takes most of the exports; and next to France, the United States, Great Britain and India are the countries most interested in the import trade.

The inhabitants of Guadeloupe consist of a few white officials and planters, a few East Indian immigrants from the French possessions in India, and the rest negroes and mulattos. These mulattos are famous for their grace and beauty of both form and feature. The women greatly outnumber the men, and there is a very large percentage of illegitimate births. Pop. (1900) 182,112.

The governor is assisted by a privy council, a director of the interior, a procurator-general and a paymaster, and there is also an elected legislative council of 30 members. The colony forms a department of France and is represented in the French parliament by a set of deputies. Political elections are very eagerly contested, the mulatto element always striving to gain the preponderance of power.

The seat of government, of the Apostolic administration and of the court of appeal is at Basse-Terre (7762), which is situated on the south-west coast of the island of that name. It is a picturesque, healthy town standing on an open roadstead. Pointe-à-Pitre (17,242), the largest town, lies in Grande-Terre near the mouth of the Rivière Salée. Its excellent harbour has made it the chief port and commercial capital of the colony. In 1859 pointe-à-grande-Terre was the centre of a great sugar boom, and Grande-Terre does a considerable export trade in sugar, despite its poor harbour. Of the other towns, St. Anne (3497), Morne à l'Eau (8442), Petit Canal (6748), St. François (5265), Petit Bourg (5106) and Trois Rivières (5016), are the most important.

Round Guadeloupe are grouped its dependencies, namely, La Desirade, 6 m. E., a narrow rugged island 10 sq. m. in area; Marie Galante 16 m. S.E. Les Saintes, a group of seven small islands, 7 m. S., one of the strategic points of the Antilles, with a magnificent and strongly fortified naval harbour; St. Martin, 142 m. N.N.W.; and St. Bartholomew, 150 m. N.N.W.

In 1635 the English and French, who were at this time in occupation of the Island of Martinique, agreed to divide Guadeloupe, and so it was divided. In 1655 it was discovered by Columbus in 1493, and received its name in honour of the monastery of S. Maria de Guadalupe at Estremadura in Spain. In 1635 the French Company of the Islands of America, and L'olive exterminated the Caribs with great cruelty. Four chartered companies were ruined in their attempts to colonize the island, and in 1764 it passed into the possession of the French crown and long remained a dependency of Martinique. After unsuccessful attempts in 1666, 1691 and 1703, the British captured the island in 1759, and held it for four years. Guadeloupe was finally separated from Martinique in 1775, but it remained under the governor of the French Windward Islands. In 1782 Rodney defeated the French fleet near the island, and the British again obtained possession in April 1794, but in the following summer they were driven out by Victor Hugues with the assistance of the slaves whom he had liberated for the purpose. In 1802 Bonaparte, then first consul, sent an expedition to the island in order to re-establish slavery, but, after a heroic defence, many of the negroes preferred suicide to submission. During the Hundred Days in 1810, the British once more occupied the island, but, in spite of its cession to Sweden by the treaty of 1813 and a French invasion in 1814, they did not withdraw till 1816. Between 1816 and 1825 the code of laws peculiar to the island was introduced. Municipal institutions were established in 1837; and slavery was finally abolished in 1848.

GUADET, MARGUERITE ÉLIE (1753-1794), French Revolutionist, was born at St. Émilien near Bordeaux on the 24th of July 1758. When the Revolution broke out he had already gained a reputation as a brilliant advocate at Bordeaux. In 1791 he was made administrator of the Girondins and in 1791 president of the criminal tribunal. In this year he was elected to the Legislative Assembly as one of the brilliant group of deputies known subsequently as Girondins or Girondists. As a supporter of the constitution of 1791 he joined the Jacobin club, and here and in the Assembly became an eloquent advocate of all the measures directed against real or supposed traitors to the constitution. He bitterly attacked the ministers of Louis XVI., and was largely instrumental in forcing the king to accept the Girondist ministry of the 15th of March 1792. He was
an ardent advocate of the policy of forcing Louis XVI into harmony with the Revolution; moved (May 3) for the dismissal of the king's non-juring confessor, for the banishment of all non-juring priests (May 16), for the disbandment of the royal guard (May 30), and the formation in Paris of a camp of fédérés (June 4). He remained a royalist, however, and with Gensonné and Vergniaud even addressed a letter to the king soliciting a private interview. Whatever negotiations may have resulted, however, were soon short by the insurrection of the 26th of August. Guadet, who presided over the Assembly during part of this fateful day, put himself into vigorous opposition to the insurrectionary Commune of Paris, and it was on his motion that on the 30th of August the Assembly voted its dissolution—a decision reversed on the following day. In September Guadet was elected by a large majority as deputy to the Convention. At the trial of Louis XVI he voted for an appeal to the people and for the death sentence, but with a respite pending appeal. In March 1793 he had several conferences with Danton, who was anxious to bring about a rapprèchement between the Girondists and the Mountain during the war in La Vendée, but he unconditionally refused to join hands with the man whom he held responsible for the massacres of September. Involved in the fall of the Girondists, and his arrest being decreed on the 2nd of June 1793, he fled to Caen, and afterwards hid in his father's house at St Emilion. He was discovered and taken to Bordeaux, where, after his identity had been established, he was guillotined on the 17th of June 1794.

GUADIANA (anc. Anas, Moorish Wabdi Ana), a river of Spain and Portugal. The Guadiana was long believed to rise in the lowland known as the Campo de Monteclar, where a chain of small lakes, the Lagunas de Ruidera (partly in Ciudad Real, partly in Albacete), are linked together by the Guadiana Alto or Upper Guadiana. This stream flows north-westward from the last lake and vanishes underground within 3 m. of the river Zancara or Giguela. About 22 m. S.W. of the point of disappearance, the Guadiana Alto was believed to re-emerge in the form of several large springs, which form numerous lakes near the Zancara and are known as the "eyes of the Guadiana" (los ojos de Guadiana). The stream which connects them with the Zancara is called the Guadiana Bajo or Lower Guadiana. It is now known that the Guadiana Alto has no such course, but flows underground to the Zancara itself, which is the true "Upper Guadiana." The Zancara rises near the source of the Júcar, in the east of the tableland of La Mancha; thence it flows westward, assuming the name of Guadiana near Ciudad Real, and reaching the Portuguese frontier 6 m. S.W. of Badajoz. In passing the former province of Extremadura, it submits to a number of changes; it is wide and shallow, and only begins to be navigable at Mertola, 42 m. from its mouth. From the neighbourhood of Badajoz it forms the boundary between Spain and Portugal as far as a point near Monssaraz, where it receives the small river Priego Muñoz on the left, and passes into Portuguese territory, with a southerly direction. At Pomarão it again becomes a frontier stream and forms a broad estuary 25 m. long. It enters the Gulf of Cadiz between the Portuguese town of Villa Real de Santo Antonio and the Spanish Ayamonte, after a total course of 510 m. Its mouth is divided by sandbanks into many channels. The Guadiana drains an area of 31,940 sq. m. Its principal tributaries are the Zajar, Jabalón, Machalí and Ardila from the left; the Bullaque, Rucacas, Bota, Degebe and Corbes from the right.

The GUADIANA Menor (or Guadianamenor, i.e. "Lesser Guadiana") rises in the Sierra Nevada, receives two large tributaries, the Fardes from the right and Barbata from the left, and enters the Guadalquivir near Ubeda, after a course of 95 m.

GUADIX, a city of southern Spain, in the province of Granada; on the left bank of the river Guadix, a tributary of the Guadiana Menor, and on the Madrid-Valdepeñas-Almeria railway. Pop. (1900) 12,652. Guadix occupies part of an elevated plateau among the northern foothills of the Sierra Nevada. It is surrounded by ancient walls, and was formerly dominated by a Moorish castle, now in ruins. It is an episcopal see of great antiquity, but its cathedral, built in the 18th century on the site of a mosque, possesses little architectural merit. The city was once famous for its cutlery; but its modern manufactures (chiefly earthenware, hempen goods, and hats) are inconsiderable. It has some trade in wool, cotton, flax, corn and liqueurs. The warm mineral springs of Graena, much frequented during the summer, are 6 m. W. Guadix el Viejo, 5 m. N.W., was the Roman Acra, and, according to tradition, the seat of the first Iberian hibispic, in the 2nd century. After 711 it rose to some importance as a Moorish fortress and trading station, and was renamed Wad Ash, "Water of Life." It was surrendered without a siege to the Spaniards, under Ferdinand and Isabella, in 1489.

GUADUAS, a town of the department of Cundinamarca, Colombia, 53 m. N.W. of Bogotá on the old road between that city and the Magdalena river port of Honda. Pop. (1900 estimate) 9000, chiefly Indians or of mixed blood. It stands in a narrow and picturesque valley formed by spurs of the Eastern Cordillera, and on a small stream bearing the same name, which is that of the South American bamboo (guaduas), found in great abundance along its banks. Sugar-cane and coffee are cultivated in the vicinity, and fruits of various kinds are produced in great abundance. The elevation of the town is 3333 ft. above the sea, and it has a remarkably uniform temperature throughout the whole year. Guadus has a pretty church facing upon its plaza, and an old monastery now used for secular purposes.

The importance of the town sprang from its position on the old camino real between Bogotá and Honda, an importance that has passed away with the completion of the railway from Girardot to the Bogotá plateau. Guadus was founded in 1614.

GUAIACUM, a genus of trees of the natural order Zygophyllaceae. The guaiacum or lignum-vitae tree (Ger. Guajakbaum, Fr. Guatoumbo, Pockenholzbaum; Fr. Gayac, Galec, officinale, is a native of the West Indies and the north coast of South America, where it attains a height of 20 to 30 ft. Its branches are numerous, flexuous and knotted; the leaves opposite and pinnate, with caducous (falling early) stipules, and entire, glabrous, obovate or oval leaflets, arranged in 2 or, more rarely, 3 pairs; the flowers are in axillary clusters (cyms), and have 5 oval pubescent sepals, 5 distinct pale-blue petals three times the length of the sepalas, 10 stamens, and a 2-celled superior ovary. The fruit is about 3 in. long, with a leathery pericarp, and contains in each of its two cells a single seed (see fig.). G. sanctum grows in the Bahamas and Cuba, and at Key West in Florida. It is distinguished from G. officinale by its smaller and narrower leaflets, which are in 4 to 5 pairs, by its shorter and glabrous sepals, and 3-celled and 3-winged fruit. G. arboresum, the guaiacum tree of Colombia, is found in the valley of the Magdalena, and is also a 2-celled fruit, grows about sea-level, and reaches considerable dimensions. Its wood is of a yellow colour merging into green, and has an almost pulvulrent fracture; the flowers are yellow and conspicuous; and the fruit is dry and 4-winged.

The lignum vitae of commerce, so named on account of its high reputation as a medicinal agent in past times, when also it was known as lignum sanctum and lignum Indicum, lignum guayacanum, or simply guayacan, is procured from G. officinale, and in smaller amount from G. sanctum. It is exported in large logs or blocks, generally stripped of bark, and presents in transverse section a very slightly marked concentric rings of growth, and scarcely any traces of pith; with the aid of a magnifying glass the medullary rays are seen to be equidistant and very numerous. The outer wood, the sapwood or alburnum, is of a pale yellow hue, and devoid of resin; the inner, the heartwood or duramen, which is by far the larger proportion, is of a dark greenish-brown, contains in its pores 26% of resin, and has a specific gravity of 1.333, and therefore sinks in water on which the alburnum floats. Owing to the diagonal and oblique arrangement of the successive layers of its fibres, the wood cannot be split; and on account of its hardness, density and durability it is much valued for the manufacture of ships’ pulleys, rulers, skittle-balls, mallets and other articles.
Chips or turnings of the heartwood of G. officinale (guaiaci lignum) are employed in the preparation of the liquor sarsae compositus concentratus of British pharmacy. They may be recognized by being either yellow of greenish-brown in colour, and by turning bluish-green when treated with nitric acid, or when heated with corrosive sublimate, and green with solution of chloride of lime. They are occasionally adulterated with boxwood shavings. Lignum vitae is imported chiefly from St Domingo, the Bahamas and Jamaica.

The bark was formerly used in medicine; it contains much calcium oxalate, and yields on incineration 25% of ash. Guaiacum resin, the guasici resina of pharmacopoeias, is obtained from the wood as an exudation from natural fissures or from incisions; it heating billets about 5 ft. in length, bordered to permit of the outflow of the resin; or by boiling chips and rasps in water to which salt has been added to raise the temperature of effervescence. It occurs in rounded or oval tears, commonly coated with a greyish-green dust, and supposed to be the produce of G. sanctum, or in large brownish or greenish-brown masses, translucent at the edges; fuses at 85° C.; is brittle, and has a vitreous fracture, and a slightly balsamic odour, increased by pulverization and by heat; and is at first tasteless when chewed, but produces subsequently a sense of heat in the throat. It is readily soluble in alcohol, ether, chloroform, cresote, oil of cloves and solutions of caustic alkalies and its solution gives a blue colour with gluten, raw potato parings and the roots of horse-radish, carrot and various other plants. The alcoholic tincture becomes green with sodium hypochlorite, and with nitric acid turns in solution green, blue and brown. With glicerine it gives a clear solution, and with nitrous ether a bluish-green gelatinous mass. It is blued by various oxidizing agents, e.g. ozone, and as Schögerlein discovered, by the juice of certain fungi. The chief constituents are three distinct resins, guaiacenic acid, C₉H₆O₃ (70%), guaiic acid, which is closely allied to benzoic acid, and guaiaretic acid. Like all resins, these are insoluble in water, soluble in alkalies, but precipitated on neutralization of the alkaline solution.

Guaiacum wood was first introduced into Europe by the Spaniards in 1508, and Nicolaus Poll, writing in 1517 (see Luisinus, De morbo gallico, p. 210, Ven., 1560), states that some three thousand persons in Spain had already been restored to health by its use. The uses of the resin, however, were not known until a later period, and in Thomas Paynel's translation (Of the Wood called Guaiacum, &c., p. 9, ed. of 1546) of Ulrich von Hutten's treatise De morbo gallico curandis per administrationem ligni guaiacei (1518) we read, "The wood: 'There foloweth fro it, when it bourneth a gomme, which we yet knowe note, for what purpose it serueth.' Flickeiger and Hanbury (Pharmacographia, p. 95) state that the first edition of the London Pharmacopoeia in which they find the resin mentioned is that of 1767. The decoction of the wood was administered in gout, the stone, palsy, leprosy, dropsy, epilepsy, and other diseases, but principally in the "morbus gallicus," or syphilis, for which it was reckoned a certain specific, insomuch that at first "the physicians wold not allow it, perceuuying that they profite wolde decay therby" (Paynel, op. cit., p. 8). Minute instructions are given in old works as to the mode of administering guaiacum. The patient was confined in a closed and heated chamber, was placed on the lowest possible diet, and, after liberal purgation, was made twice a day to drink a milk-warm decoction of the wood. The use of salt was specially to be avoided. A decoction of 1 lb of guaiacum was held to be sufficient for the four first days of the treatment. The earlier opinions as to the efficacy of guaiacum in the treatment must of course be discarded. It is more than probable that the fury of the typhus fever is often due to the treatment with guaiacum (Observations on the Effects of Various Articles of the Mat. Med. in the Cure of Lues Venerea, c. i., 2nd ed., 1807) says: "I never saw one single instance in which the powers of this medicine eradicated the morbus gallicus, and it is certain that the fever is much more slowly abated when this is given, the patient being marked in cases of secondary symptoms. Guaiacum resin is given medicinally in doses of 5-15 grains. Its important preparations in the British Pharmacopoeia are the mistura guasici (dose ʒ. t. oz.), the ammoniated tincture of guaiacum (dose ʒ. t. drachm, ʒ. t. 1/2 drachm), the resin is dissolved by means of ammonia, and the trochische or lozenges, containing 3 grains of the resin. This lozenge is undiluted, but of value where the resin gave only in cases of sore throat, especially of rheumatic origin. Powdered guaiacum is also used.

Guaiacum resin differs pharmacologically from other resins in being less irritant, so that it is absorbed from the bowel and exerts remote stimulant actions, notably upon the skin and kidneys. It affects the bronchi but slightly, since it contains no volatile oil. The drug is useful both in acute and chronic sore throat, the mixture, according to Sir Lauder Brunton, being more effective than the tincture. The aperient action, which it exerts less markedly than other members of its class, renders it useful in the treatment of chronic constipation. Sir Alfred Garrod has urged the claims of this aggregate to the treatment of various cases of chronic dyspepsia. It is also employed in other forms of chronic arthritis guaiacum is may be given in combination with iodides, which it often enables the patient to tolerate. Guaiacum is not now used in the treatment of syphilis.

The treatment of guaiacum is by the application of a test for the presence of blood, or rather of haemoglobin, the red colouring matter of the blood, in urine or other secretions. This test was first suggested by John Denison, Esq. John A. C. D. in 1799. To the test-tube a drop of the tincture should be added to say, an inch of urine in a test-tube. The resin is at once precipitated, yielding a milky fluid. If "ozonic ether"—a etheral solution of hydrogen peroxide—be now poured gently round the test-tube in a deep blue coloration is produced along the line of contact if haemoglobin be present. The reaction is due to the oxidation of the resin by the peroxide of hydrogen—such oxidation occurring only if haemoglobin be present to act as an oxidizer.

GUALDO TADINO (anc. Tadimum, 1 m. to the W.), a town and episcopal see of Umbria, Italy, 1755 ft. above sea-level, in the province of Perugia, 22 m. N. of Foligno by rail. Pop. (1901), town, 4440; commune, 10,756. The suffix Tadino distinguishes it from Gualdo in the province of Macerata, and Gualdo Cattaneo, S.W. of Foligno. The cathedral has a good rose-window and possesses, like several of the other churches, 15th-century paintings by Umbrian artists, especially works by Niccolo Alunno. The town is still surrounded by walls. The ancient Tadino lay 1 m. to the W. of the modern town. It is mentioned in the Eugubine tablets (see IUVVUM) as a hostile city against which imprecactions are directed. In its neighbourhood Nares defeated and slew Totila in 552. No ruins are now visible, though they seem to have been extant in the 17th century. The new town seems to have been founded in 1237. It was at first independent, but passed under Perugia in 1292, and later became dependent on the duchy of Spoleto.

GUALEGUAYCHÚ, a flourishing town and river port of the province of Entre Rios, Argentine Republic, on the Gualeguay river, 32 m. above its confluence with the Ibiruay branch of the Parana, and about 120 m. N.N.W. of Buenos Aires. Pop. (1850) 7810. The Gualeguay is the largest of the Entre Rios rivers, traversing almost the whole length of the province from N. to S., but it is of but slight service in the transportation of produce except the few miles below Gualeguay, whose port, known as Puerto Ruiz, is 7 m. lower down stream. A steam tramway connects the town and port, and a branch line connects with Entre Rios railways at the station of Tala. The principal industry in this port is the export of stock-raised beef, mutton, wool and sheep-skins. Wood and charcoal are also exported to Buenos Aires. The town was founded in 1783.

GUALEGUAYCHÚ, a prosperous commercial and industrial town and port of the province of Entre Rios, Argentine Republic, on the left bank of the Gualeguay river, 11 m. above its confluence with the Uruguay, and 120 m. N. of Buenos Aires. Pop. (1892, est.) 14,000. It is the chief town of a department of the same name, the largest in the province. A bar at the mouth of the river prevents the entrance of larger vessels and
compels the transfer of cargoes to and from lighters. The town is surrounded by a rich grazing country, and exports cattle, jerked beef, mutton, hides, pelts, tallow, wool and various by-products. A branch line running N. connects with the Entre Rios railways at Basavilbaso. The town was founded in 1783.

GUALO, CARDINAL (fl. 1216), was sent to England by Pope Innocent III. in 1216. He supported John with all the weight of papal authority. After John’s death he crowned the infant Henry III. and played an active part in organizing resistance to the rebels led by Louis of France, afterwards king Louis VIII. As representing the pope, the suzerain of Henry, he claimed the regency and actually divided the chief power with William Marshal, earl of Pembroke. He proclaimed a crusade against Louis and the French, and, after the peace of Lambeth, he forced Louis to make a public and humiliating profession of penitence (1217). He punished the rebellious clergy severely, and ruled the church with an absolute hand till his departure from England in 1218. Gualo’s character has been severely criticized by English writers; but his chief offence seems to have been that of representing unpopular papal claims.

GUAM (Span. Guaian; Guahan, in the native Chamorro), the largest and most populous of the Ladrone or Mariana Islands, in the North Pacific, in 13° 26’ N. lat. and 144° 30’ E. long., about 1823 m. E. by S. of Hong Kong, and about 1430 m. E. of Manila. Pop. (1908) about 11,360, of whom 536 were foreigners, 140 being members of the U.S. naval force. Guam extends about 30 m. N. by E. to S.S.W., has an average width of about 69 m., and has an area of 207 sq. m. The N. portion is a plateau from 300 to 600 ft. above the sea, lowest in the interior and highest along the E. and W. coast, where it terminates abruptly in bluffs and headlands; Mt Santa Rosa, toward the N. extremity, has an elevation of 840 ft. A range of hills from 700 to nearly 1300 ft. in height traverses the S. portion from N. to S. a little W. of the middle—Mt Jumullong Mangoc, the highest peak, has an elevation of 1274 ft. Between the foot of the steep W. slope of these hills and the sea is a belt of rolling lowlands and to the E. the surface is broken by the valleys of five rivers with a number of tributaries, has a general slope toward the sea, and terminates in a coast-line of bluffs. Apra (formerly San Luis d’Apra) on the middle W. coast is the only good harbour; it is about 3½ m. across, has a depth of 4-27 fathoms, and is divided into an inner and an outer harbour by a peninsula and an island. It serves as a naval station and as a port of transit between America and the Philippines, at which army transports call monthly. Deer, wild hog, dog, curlew, snipe and pigeon are abundant game, and several varieties of fish are caught. Some of the highest points of the island approaches sometimes visit Guam. The island is thought to possess little if any mineral wealth, with the possible exception of coal. Only a small part of Guam is under cultivation, and most of this lies along the S.W. coast, its chief products being coconuts, rice, sugar, coffee and cacao. A United States Agricultural Experiment Station in Guam (at Agaña) was provided for in 1908.

The inhabitants are of the Chamorro (Indonesian) stock, strongly intermixed with Philippine Tagals and Spaniards; their speech is a dialect of Malay, corrupted by Tagal and Spanish. There are very few full-blood Chamorros. The aboriginal native was of a very dark mahogany or chocolate colour. A majority of the total number of natives live in Agaña. The natives are nearly all farmers, and most of them are poor, but their condition has been improved under American rule. Public schools have been established; in 1908 the enrolment was 1700. On the island there is a small colony of lepers, segregated after American occupation. Gangrosa is a disease said to be peculiar to Guam and the neighbouring islands; it is due to a specific bacillus and usually destroys the nasal septum. The victims of this disease also are segregated. There is a good general hospital in the city.

Agaña (or San Ignacio de Agaña) is the capital and principal town; under the Spanish régime it was the capital of the Ladrones. It is about 5 m. N.E. of Piti, the landing-place of Apra harbour and port of entry, with which it is connected by an excellent road. Agaña has paved streets and sewer and water systems. Other villages, all small, are Asan, Piti, Sumay, Umata, Merizo and Inarajan. Guam is governed by a “naval governor,” an officer of the U.S. navy who is commandant of the naval station. The island is divided into four administrative districts, each with an executive head called a gobernadorcillo (commissioner), and there are a court of appeals, a court of first instance and courts of justices of the peace. Peoneage was abolished in the island by the United States in February 1900. Telegraphic communication with the Caroline Islands was established in 1905; in 1908 there were four cables ending at the relay station at Sumay on the shore of Apra harbour.

Guam was discovered by Magellan in 1521, was occupied by Spain in 1668, was captured by the United States cruiser "Charleston" in June 1899, and was ceded to the United States by the Treaty of Paris (December 10, 1898). See a List of Books (with References to Periodicals) on Samoa and Guam (1901; issued by the Library of Congress); L. M. Cox, "The Island of Guam," in Bulletin of the American Geographical Society, vol. 36 (New York, 1904); Gen. Joseph Wheeler, Report on the Island of Guam, June 1906 (War Department, Document No. 123); F. W. Christian, The Caroline Islands (London, 1899); an account of the flora of Guam by W. E. Safford in the publications of the National Herbarium (Smithsonian Institution); and the reports of the naval governor.

GUAN, a word apparently first introduced into the ornithologist’s vocabulary about 1743 by Edwards, who said that a bird he figured (Nat. Hist. Uncom. Birds, pl. xiii.) was “so called in the West Indies,” and the name has hence been generally applied to all the members of the subfamily Penelope, which are distinguished from the kindred subfamily Cracinae or curassows by the broad postacetabular area of the pelvis as pointed out by Huxley (Proc. Zool. Society, 1865, p. 297), as well as by their maxilla being wider than it is high, with its culmen depressed, the crown feathered, and the nostrils bare. In summer two characteristic species of Penelope are found in the Orinoco, which form the third subfamily of the Cricitidae, a family belonging to that taxonomist’s division Peristeropodes of the order Gallinae. The Penelopeinae have been separated into seven genera, of which Penelope and Ortilis, containing respectively about sixteen and nineteen species, are the largest, the others numbering from one to three only. Into their minute differences it would be useless to enter: nearly all have the throat bare of feathers, and form that of many of them hangs a wattle; but one form, Chamaelex, has neither of these features, and Stenogalea, though wattled, has the throat clothed. With few exceptions the guans are confined to the South-American continent; one species of Penelope is however found in Mexico (e.g. at Mazatlan). Pipile cumanensis inhabits Trinidad as well as the mainland, while three species of Ortilis occur in Mexico or Texas, and one, which is also common to Venezuela, in Taboga. Like curassows, guans are in great measure of arboreal habit. They also readily Edwards also gives "quarn" as an alternative spelling, and this is nearer the original. See also Dufresne in Dufresne’s writing (Voy. ii. cap. xvi. p. 66), but that was doubtless spelled if not the same bird as the "quarn." The species represented by Edwards does not seem to have been identified.

See the excellent Synopsis by Selater and Salvin in the Proceedings of the Zoological Society for 1870 (pp. 504-544), while further information on the Cracinae was given by Selater in the Transactions of the same society (iv. pp. 273-288, pls. xi.-xiii.). Some additions have since been made to the knowledge of the family, but none of very great importance.
become tame, but all attempts to domesticate them in the full
sense of the word have wholly failed, and the cases in which they
have even been induced to breed and the young have been
reared in confinement are very few. Yet it would seem that
guans and curassows will interbreed with poultry (Ibis, 1866,
p. 24; Bull. Soc. Imp. d'Acclim., 1868, p. 559; 1869,
p. 357), and what is more extraordinary is that in Texas the
hybrids between the chiascallaca (Ortalis vetula) and the
domestic fowl are asserted to be far superior to ordinary game-cocks
for fighting purposes.

GUANABACOA (an Indian name meaning “site of the
waters”), a town of Cuba, in Havana province, about 6 m. E.
of Havana. Pop. (1907) 14,368. Guanabacoa is served by railway
to Havana, with which it is connected by the Regla ferry across
the bay. It is picturesquely situated amid woods, on high hills
which furnish a fine view. There are medicinal springs in the
town, and deposits of liquid bitumen in the neighbouring hills.
The town is essentially a residence suburb of the capital, and it
has some rather pretty streets and squares and some old and interest-
ing churches (including Nuestra Señora de la Asunción, 1741–
1772). Just outside the city is the church of Potosí with a
famous “wonder-working” shrine and altar. The symbol of the pueblo of the same name existed here before 1555, and a church
was established in 1576. Already at the end of the 17th century
Guanabacoa was the fashionable summer residence of Havana.
It enjoyed its greatest popularity in this respect from the end of
the 18th to the middle of the 19th century. It was created a
villa with an ayuntamiento (city council) in 1743. In 1762 its
fort, the Little Morro, on the N. shore near Cojimar (a bathing
beach, where the Key West cable now lands), was taken by the
English.

GUANACO, sometimes spelt Huanaaco, the larger of the two
wild representatives in South America of the camel tribe; the
other being the vicugna. The guanaco (Lama guanaco), which
stands nearly 4 ft. at the shoulder, is an elegant creature, with
gracefully curved neck and long slender legs, the hind-pair of the
latter bearing two naked patches or callosities. The head
and body are covered with long soft hair of a fawn colour above and
almost pure white beneath. Guanaco
are found throughout
the southern half of South America, from Peru in the north to
Cape Horn in the south, but occur in greatest abundance
in Patagonia. They live in herds usually of from six to thirty,
although these occasioni
contain
certain
several hundred
whilst solitary individ-
uals are sometimes
met. They are ex-
ceedingly timid, and
therefore wary and
difficult of approach; like many other ruminants, however,
their curiosity sometimes overcomes their timidity, so as to
bring them within range of the hunter's rifle. Their cry
is peculiar, being something between the bellowing of a deer
and the neigh of a horse. The chief enemies of the
guanaco are the Patagonian Indians and the puma, as it forms
the principal food of both. Its flesh is palatable although
wanting in fat, while its skin forms the chief clothing material
of the Patagonians. Guanaco are readily domesticated, and in
this state become very bold and will attack man, striking him
from behind with both knees. In the wild state they never
defend themselves, and if approached from different points,
according to the Indian fashion of hunting, get completely
bewildered and fall an easy prey. They take readily to the
water, and have been observed swimming from one island to
another, while they have been seen drinking salt-water. They
have a habit of depositing their droppings during successive
days on the same spot—a habit appreciated by the Peruvian
Indians, who use those deposits for fuel. Guanaco also have
favourite localities in which to die, as appears from the great
heaps of their bones found in particular spots.

GUANAJAY, a town of western Cuba, in Pinar del Río province,
about 36 m. (by rail) S.W. of Havana. Pop. (1907) 6400.
Guanajay is served by the W. branch of the United railways
of Havana. The town lies among hills, has an excellent climate, and in colonial times was (like Holguín) an acclimatization station for troops fresh from Spain; it now has considerable repute as a health resort. The surrounding
country is a fertile sugar and tobacco region. Guanajay
has always been important as a distributing point in the commerce
of the western end of the island. It was an ancient pueblo,
of considerable size and importance as early as the end of the
18th century.

GUANAJUATO, or GUANAJUATO, an inland state of Mexico,
bordered by Zacatecas and San Luis Potosí, E. by Querétaro,
S. by Michoacán and Morelos, N. by Aguascalientes, and W.
by Guadalajara. It is one of the most densely populated states of the republic;
pop. (1895) 1,047,817; (1900) 1,061,724. The state lies
wholly within the limits of the great central plateau of Mexico,
and has an average elevation of about 6000 ft. The surface
of its northern half is broken by the Sierra Gorda and Sierra
de Guanajuato, but its southern half is covered by fertile plains
largely devoted to agriculture. It is drained by the Rio Grande
de Lerma and its tributaries, which in places flow through deeply
eroded valleys. The climate is semi-tropical and healthy,
and the rainfall is sufficient to insure good results in agriculture
and stock-raising. In the warm valleys sugar-cane is grown, and
at higher elevations Indian corn, beans, barley and wheat.
The southern plains are largely devoted to stock-raising. Guan-
ajuato has suffered much from the destruction of its forests,
but there remain some small areas on the higher elevations of
the north. The principal industry of the state is mining, the
mineral wealth of the mountain ranges of the north being
enormous. Among its mineral products are silver, gold, tin,
lead, mercury, copper and opals. Silver has been extracted
for a long time; the days of the Spanish conquest, over $800,000,000
having been taken from the mines during the last 250 years
and a half centuries. Some of the more productive of these mines,
or groups of mines, are the Veta Madre (mother lode),
the San Bernabé lode, and the Rayas mines of Guanajuato, and
the La Valenciana mine, the output of which is said to have
been $26,000,000 between 1766 and 1826. The manufacturing
establishments include flour mills, tanneries and manufactories
of leather, cotton and woolen mills, distilleries, foundries and
potteries. The Mexican Central and the Mexican National
railway lines cross the state from N. to S., and the former
operates a short branch from Silao to the state capital and
another westward from Irapuato to Guadalajara. The capital
is Guanajuato, and other important cities and towns are León,
or León de las Alamedas; Celaya (pop. 25,565 in 1900),
an important railway junction 22 m. by rail W. from Querétaro,
and known for its manufactures of broadcloth, saddlery, soap
and sweetmeats; Irapuato (18,593 in 1900), a railway junction
and commercial centre, 21 m. S. by W. of Guanajuato; Silao
(15,355), a railway junction and manufacturing town (woollens
and cottons), 14 m. S.W. of Guanajuato; Salamanca (13,583),
being the central half of Central Mexico during the year 1555,
S. by E. of Guanajuato, with manufactures of cottons and porcelains;
Allende (10,547), a commercial town 30 m. E. by S. of Guanajuato,
with mineral springs; Valle de Santiago (12,660), 50 m. W. by S.
of Querétaro; Salatierra (10,393), 60 m. S.E. of Guanajuato;
Cortazar (8633); La Luz (8183), in a rich mining district;
Pénjamo (8262); Santa Cruz (7239); San Francisco del Rincón
(8,904), 30 m. W. of Guanajuato in a rich mining district;
and Acamboro (8345), a prosperous town of the plain, 76 m.
S.S.E. of Guanajuato.
GUANAJUATO, or SANTA FÉ DE GUANAJUATO, a city of Mexico and capital of the above state, 155 m. (direct) N.W. of the Federal capital, on a small tributary of the Rio Grande de Lerma or Santiago. Pop. (1895) 39,404; (1900) 41,486. The city is built in the Cañada de Marfil at the junction of three ravines about 6,500 ft. above the sea, and its narrow, tortuous streets rise steeply as they follow the ravines upward to the mining villages clustered about the opening of the mines in the hillsides. Guanajuato is described sometimes as a a colossal, old city in ruins, but in addition there is the central city with its crowded winding streets, its substantial old Spanish buildings, its fifty ore-crushing mills and busy factories and its bustling commercial life. Enclosing the city are the steep, barren mountain sides honeycombed with mines. The climate is semi-tropical and is considered healthy. The noteworthy public buildings and institutions are an interesting old Jesuit church with arches of pink stone and delicate carving, eight monasteries, the government palace, a mint dating from 1812, a national college, the Teatro Juárez, and the Pantheón Nacional, with catacombs below. The Alhóndiga de Granaditas, originally a public granary, was used as a fort during the War of Independence and is celebrated as the scene of the first battle (1810) in that long struggle. Among the manufactures are cottons, prints, soaps, chemicals, pottery and silverware, but mining is the principal interest and occupation of the population. The silver mines of the vicinity were long considered the richest in Mexico, the celebrated Veta Madre (mother lode) even being described as the richest in the world; and Guanajuato has the largest reduction works in Mexico. The principal attraction in the city consists of a short branch of the Mexican Central, which joins the trunk line at Silao. Guanajuato was founded in 1554. It attained the dignity of a city in 1741. It was celebrated for its vigorous resistance to the invaders at the time of the Spanish conquest, and was repeatedly sacked during that war.

GUANCHES, GUANCHES or GUANCHOS (native Guanchet; Guan=person, Chinel=Tenerife, —"man of Tenerife," corrupted, according to Nuñez de la Peña, by Spaniards into Guanches), the aboriginal inhabitants of the Canary Islands. Strictly the Guanches were the primitive inhabitants of Tenerife, where they seem to have preserved racial purity to the time of the Spanish conquest, but the name came to be applied to the indigenous populations of all the islands. The Guanches, now extinct as a distinct people, appear, from the study of skulls and bones discovered, to have resembled the Cro-Magnon race of the Quaternary age, and no real doubt is now entertained that they were an offshoot of the great race of Berbers which from the dawn of history has occupied northern Africa from Egypt to the Atlantic. Pliny the Elder, deriving his knowledge from the accounts of Juba, king of Mauretania, states that when visited by the Carthaginians under Hanno the archipelago was found by them to be uninhabited, but that they saw ruins of great buildings. This would suggest that the Guanches were not the first inhabitants, and from the absence of any trace of Mahomedanism among the peoples found in the archipelago by the Spaniards it would seem that this extreme westerly migration of Berbers took place between the time of which Pliny wrote and the conquest of northern Africa by the Arabs. Many of the Guanches fell in resisting the Spaniards, many were sold as slaves, and many conformed to the Roman Catholic faith and married Spaniards.

Such remains as there are of their language, a few expressions and the proper names of ancient chieftains still borne by certain families, connect it with the Berber dialects. In many of the islands signs are engraved on rocks. Domingo Vandewalle, a military governor of Las Palmas, was the first, in 1752, to investigate these; and it is due to the perseverance of D. Aquilino Padran, a priest of Las Palmas, that anything about the inscription on the island Hierro has been brought to light. In 1878 Dr. R. Verneau discovered in the ravines of Las Balos some grotesque Berber inscriptions. Witnessing these inscriptions have proved to be Numidic. In two of the islands (Teneriffe and Gomera) the Guanche type has been retained with more purity than in the others. No inscriptions have been found in these two islands, and therefore it would seem that the true Guanches did not know how to write. In the other islands numerous Semitic traces are found, and in all of them are the rock-signs. From these facts it would seem that the Numidians, travelling from the neighbourhood of Carthage and intermixing with the dominant Semitic race, landed in the Canary Islands, and that it is they who have written the inscriptions at Hierro and Teneriffe and the Guanches of the Canaries.

The political and social institutions of the Guanches varied. In some islands hereditary autocracy prevailed; in others the government was elective. In Teneriffe all the land belonged to the chiefs who leased it to their subjects. In Grand Canary suicide was regarded as honourable, and on a chief inheriting, one of his subjects willingly honoured the occasion by throwing himself over a precipice. In some islands polyandry was practised; in others the natives were monogamous. But everywhere the women appear to have been respected, an insult which fell to the woman by transforming man being a capital offence. Almost all the Guanches used to wear garments of goat-skins, and others of vegetable fibres, which have been found in the tombs of Grand Canary. They had a taste for ornaments, necklaces of wood, bone and shells, worked in different designs. Beads of baked earth, cylindrical and of all shapes, with smooth or polished surfaces, mostly black and red in colour, were chiefly in use. They painted their bodies; the pintaderas, baked clay objects like seals in shape, have been explained by Dr Verneau as having been used solely for painting the body in various colours. They manufactured rough pottery, mostly without decorations, or ornamented by means of the finger-nail. The Guanches' weapons were those of the ancient races of south Europe. The polished battle-axe was more used in Grand Canary, while stone and obsidian, roughly cut, were commoner in Teneriffe. They had, besides, the lance, the club, sometimes studded with pebbles, and the javelin, and they seem to have known the shield. They lived in natural or artificial caves in their mountains. In districts where cave-dwellings were impossible, they built small round houses and, according to the Spaniards, they even practised rude fortification. In Palma the old people were at their own time left to die alone. After bidding their family farewell they were carried to the sepulchral cave, nothing but a bowl of milk being left them. The Guanches embalmed their dead; many mummies have been found in an extreme state of desiccation, each weighing not more than 6 or 7 lb. Two almost inaccessible caves in a vertical rock by the shore 3 m. from Santa Cruz (Teneriffe) are said still to contain bones. The process of embalming seems to have varied. In Teneriffe and Grand Canary the corpse was simply wrapped up in goat and sheep skins, while in other islands a resinous substance was used to preserve the body, which was then placed in a cave difficult of access, or buried under a tumulus. The work of embalming was reserved for a special class, women for female corpses, men for male. Embalming seems not to have been universal, and bodies were often simply hidden in caves or buried.

Little is known of the religion of the Guanches. They appear to have been a distinctly religious race. There was a general belief in a supreme being, called Acoran, in Grand Canary, Achihuran in Teneriffe, Eraoranhan in Hierro, and Abora in Palma. The women of Hierro worshipped a goddess called Moneiba. According to tradition the male and female gods lived in mountains whence they descended to hear the prayers of the people. In other islands the natives venerated the sun, moon, earth and stars. A belief in an evil spirit was general. The demon of Teneriffe was called Guayota and lived in the peak of Teyde, which was the hell called Echeyde. In times of drought the Guanches drove their flocks to consecrated grounds, where the lambs were separated from their mothers in the belief that their plaintive bleatings would melt the heart of the Great Spirit. During the religious feasts all war and even personal quarrels were stayed. Bibliography.—S. Berthelot, Antiquités canariennes (Paris, 1839); Baker Webb and S. Berthelot, Histoire naturelle des îles Canaries.

GUANAJUATO—GUANCHES
GUANIDINE—GUARANIS

GUANIDINE, CNH₂H₃ or HC(NH₂)₃, the amide of amidocarbamic acid. It occurs in bee juice. It was first prepared in 1861 by A. Streeker, who oxidized guanine with hydrochloric acid and potassium chloride. It may be obtained synthetically by the action of ammonia on cyanamide, CN-NH₂ + H₂ = CNH₂H₃, heating ortho-carboxylic acid ammonium cyanate to 150°C; but best by heating ammonium thio cyanate to 180-190°C, when the thioura is formed, 2CS(NH₂)=HN:CNH₂H₃CN-S + H₂S. It is a colourless crystalline solid, readily soluble in water and alcohol; it deliquesces on exposure to air. It has strong basic properties, absorbs carbon dioxide readily, and forms well-defined crystalline salts. Baryta water hydrolysles it to urea. By direct union with glycocoll acid, it yields glycynamine, NH₂(NH₂)CN - CH₂CO₂H, whilst with methyl glycocoll (sarcosine) it forms creatine, NH₂(NH₂)CN - C(NH₂)CH₂CO₂H.

Many derivatives of guanidine were obtained by J. Thiele (Ann., 1829, 270), p. 11; 1863, 273, p. 133; Ber., 1893, 26, pp. 2589, 2645). By the action of nitric acid on guanidine in the presence of sulphuric acid, nitroguanidine, HN:CN(NH₂)-NO₂ (a substance possessing many characteristics of an acid), was obtained. By further reduction with zinc dust, amidoguanidine, HN:CN(NH₂)-NH₂ is formed. This amidoguanidine decomposes on hydrolysis with the formation of semicarbazide, NH₂CO-NH-NH₂, which, in its turn, breaks down into carbon dioxide, ammonia and hydrazine. Amidoguanidine is a body of hydrazine type, for it reduces gold and silver salts and yields a benzylidene derivative. On oxidation with potassium permanganate, it gives azodicarbolicdiamidine nitrate, NH₂(NH₂)-H₂NO₃, which, when reduced by sulphuretted hydrogen, is converted into the corresponding hydrazodiacarbdiamidine, NH₂(NH₂):N-C:NNH₂:NNH₂. By the action of nitric acid on amidoguanidine, NH₂(NH₂):N-C:NNH₂:NNH₂, amidoguanidine nitrate, NH₂(NH₂):N-C:NNH₂:NNH₂, is formed. This diazo compound is decomposed by caustic alkalis with the formation of cyanamide and hydrazine acid, CH₂N₂NO-NH₂ + C(NH₂)NH₂ + HNO₂, whilst acetates and carbamates convert it to amidotetrazinic acid, H₂N-C:NNH₂, or amidotetrazinic acid yields addition compounds with amines, and by the further action of nitric acid yields a very explosive derivative, diaziotrazol, CN. By fusing guanidine with urea, dicyandiamide HN(NH)=CN = CO-NH in foundation.

GUANO (a Spanish word from the Peruvian alman, dung), the excrement of birds, found as large deposits on certain islands off the coast of Peru, and on others situated in the southern ocean and off the west coast of Africa. The large proportions of phosphorus in the form of phosphates and of nitrogen as ammonium oxalate and urate renders it a valuable fertilizer. Bat's guano, composed of the excrement of bats, is found in certain caves in New Zealand and elsewhere; it is similar in composition to Peruvian guano. (See MANURES AND MANURING.)

GUANTA, a port on the Caribbean coast of the state of Ber- médizo, Venezuela, 12 m. N.E. of Barcelona, with which it is connected by rail. It dates from the completion of the railway to Maracaibo in 1871. It is situated on the coast of early 12th century, and was created for the shipment of coal. The harbour is horse-shoe-shaped, with its entrance, 1908 ft. wide, protected by an island less than 1 m. off the shore. The entrance is easy and safe, and the harbour affords secure anchorage for large vessels, with deep water alongside the iron railway wharf. These advantages have made Guanta the best port on this part of the coast, and the trade of Barcelona and that of a large inland district have been transferred to it. A prominent feature in its trade is the shipment of live cattle. Among its exports are sugar, coffee, cacao, tobacco and fruit.

GUANTANAMO, the third most important town of the S. coast of Cuba, in the province of Santiago, about 40 m. E. of Santiago. Pop. (1907) 14,559. It is situated by the Guazo (or Guazu) river, on a little open plain between the mountains. The beautiful, land-locked harbour, 10 m. long from N. to S. and 4 m. wide in places, has an outer and an inner basin. The latter has a very narrow entrance, and 2 to 2.5 fathoms of depth. From the port of Caacúmena to the city of Guantánamo, 13 m. N., there is a railway, and the city has railway connexion with Santiago. Guantánamo is one of the two ports leased by Cuba to the United States for a naval station. It is the shipping-port and centre of a surrounding coffee-, sugar- and lime-growing district. In 1741 an English force under Admiral Edward Vernon and General Thomas Wentworth landed here to attack Santiago. They named the harbour Cumberland Bay. After their retreat fortifications were begun. The history of the region practically dates, however, from the end of the 18th century, when it gained prosperity from the settlement of French refugees from Santo Domingo; the town, as such, dates only from 1822. Almost all the old families are of French descent, and French was the language largely used until it was displaced by the Spanish in the 19th century. In recent years, especially since the Spanish-American War of 1898, the region has greatly changed socially and economically. Guantánamo was once a fashionable summer residence resort for wealthy Cubans.

GUARANA (so called from the Guarani, an aboriginal American tribe), the plant Paullinìa cupana (or P. sorbilis) of the natural order Sapindaceae, indigenous to the north and west of Brazil. It has a smooth erect stem; large plinate alternate leaves, composed of 5 oblong-oval leaflets; narrow panicles of short-stalked flowers; and ovoid or pyriform fruit about as large as a grape, and containing usually one seed only, which is shaped like a minute horse-chestnut. What is commonly known as guarana, guarana bread or Brazilian cocoa, is prepared from the seeds as follows. In October and November, at which time they become ripe, the seeds are removed from their capsules and sun-dried, so as to admit of the ready removal by hand of the white aril; they are next ground in a stone mortar or deep dish of hard sandstone; the powder, moistened by the addition of a small quantity of water, or by exposure to the dews, is then made into a paste with a certain proportion of whole or broken seeds, and worked up sometimes into balls, but usually into rolls not unlike German sausages, 6 to 8 in. in length, and 12 to 16 in. in weight. After drying by artificial or solar heat, the guarana is packed between broad leaves in sacks or baskets. Thus prepared, it is of extreme hardness, and has a brown hue, a bitter astrangent taste, and an odour faintly resembling that of roasted coffee. An inferior kind, softer and of a lighter colour, is manufactured by admixture of cocoa or cassava. Rasped or grated into sugar and water, guarana forms a beverage largely consumed in S. America. Its manufacture, originally confined to the Mauhés Indians, has spread to various parts of Brazil. The consumption of Guarana as a nervous stimulant and restorative is due to the presence of what was originally described as a new principle and termed guaranine, but is now known to be identical with caffeine or theine. Besides this substance, which is stated to exist in it in the form of tannate, guarana yields on analysis the glucoside saponin, with tannin, starch, gum, three volatile oils, and an acrid green fixed oil (Fournier, Journ. de Pharm. vol. xxxix., 1896, p. 142).

GUARANIS, a tribe and stock of South American Indians, having their home in Paraguay, Uruguay and on the Brazilian coast. The Guaranas had developed some civilization before the arrival of the Spaniards, and being a peaceable people quickly submitted. They form to-day the chief element in the populations of Paraguay and Uruguay. Owing to its patronage by the Jesuit missionaries the Guarani language became a
GUARANTEE

widespread medium of communication, and in a corrupted form is still the common language in Paraguay.

GUARANTEE (sometimes spelt “guarantee” or “guaranty”; an O. Fr. form of “warrant,” from the Teutonic word which appears in German as wahben, to defend or make safe and binding), a term more comprehensive and of higher import than either “warrant” or “security,” and designating either some international treaty whereby claims, rights or possessions are secured, or more commonly a mere private transaction, by means of which one person, to obtain some trust, confidence or credit for another, engages to be answerable for him.

In English law, a guarantee is a contract to answer for the payment of some debt or the performance of some duty by a third person who is primarily liable to such payment or performance. It is a collateral contract, which does not extinguish the original liability or obligation to which it is accessory, but on the contrary is itself rendered null and void should the latter fail, as without a principal there can be no accessory. The liabilities of a surety are in law dependent upon those of the principal debtor, and when the latter cease the former do so likewise (per Collins, L. J., in Stacey v. Hill, 1901, 1 K.B., at p. 660; see per Willes, J., in Bateson v. Geeling, 1871, L.R. 7 C.P., at p. 14), except in cases in which the principal debtor is by operation of law (see In re Fittegeorge—ex parte Robson, 1905, 1 K.B. p. 462). If, therefore, persons wrongly suppose that a third person is liable to one of them, and a guarantee is given on that erroneous supposition, it is invalid ab initio, by virtue of the lex contracti, because its foundation (which was that another was taken to be liable) has failed (per Willes, J., in Mountstephen v. Laheman, L.R. 7 Q.B. p. 202). According to various existing codes civil, a suretyship, in respect of an obligation non-voidable, is null and void in war where the invalidity is the result of personal incapacity of the principal debtor (Codes Civil, France and Belgium, 2012; Spain, 1824; Portugal, 1822; Italy, 1899; Holland, 1858; Lower Canada, 1932). In some countries, however, the mere personal incapacity of a son under age to borrow suffices to vitiate the guarantee of a loan made to him (Spain, 1824; Portugal, 1822, 1852, 1535, 1536). The Egyptian codes sanction guarantees expressly entered into “in view of debtor’s want of legal capacity” to contract a valid principal obligation (Egyptian Codes, Mixed Suits, 605; Native Tribunals, 496). The Portuguese code (art. 823, s. 1) retains the surety’s liability, in respect of an invalid principal obligation, until the latter has been legally rescinded.

The giver of a guarantee is called “the surety,” or “the guarantor”; the person to whom it is given “the creditor,” or “the guarantee”; while the person whose payment or performance is secured thereby is termed “the principal debtor,” or simply “the principal.” In America, but not apparently elsewhere, there is a recognized distinction between “a surety” and “a guarantor”; the former being usually bound with the principal, at the same time and on the same consideration, while the contract of the latter is his own separate undertaking, in which the principal does not join, and in respect of which he is not to be held liable, until due diligence has been exerted to compel the principal debtor to make good his default. There is no privity of contract between the surety and the principal debtor, for the surety contracts with the creditor, and they do not constitute in law one person, and are not jointly liable to the creditor (per Baron Parke in Bain v. Cooper, 1 Dowell R. (N.S.) 11, 14).

No special phraseology is necessary to the formation of a guarantee; and what really distinguishes such a contract from one of insurance is not any essential difference between the two forms of words insurance and guarantee, but the substance of the contract entered into by the parties in each particular case (per Romer, L. J., in Seaton v. Heath—Seaton v. Burnand, 1899, 1 Q.B. 782, 792, C.A.; per Vaughan Williams, L. J., in In re Denton’s Estate Licenses Insurance Corporation and Guarantee Fund Ltd. v. Denton, 1904, 2 Ch., at p. 188; and see Done v. Mortgage Insurance Corporation, 1894, 1 Q.B. 54 C.A.) In this connexion it may be mentioned that the different kinds of suretyships have been classified as follows: (1) Those in which there is an agreement to constitute, for a particular purpose, the relation of principal and surety, to which agreement the creditor thereby secured is a party; (2) those in which there is a similar agreement between the principal and surety only, to which the creditor is a stranger; and (3) those in which, without any such contract of suretyship, there is a primary and a secondary liability of two persons for one and the same debt, the debt being, as between the two, that of one of those persons only, and not equally of both, so that the other, if he should be compelled to pay it, would be entitled to reimbursement from the person by whom such secondary liability had been incurred (per Earl of Selborne, L.C., in Duncan Forrest v. Co. v. Northumb. South Wales Bank, 6 App. Cas., at p. 11). According to several codes civil sureties are made divisible into conventional, legal and judicial (Fr. and Bel., 1824, 2040 et seq.; Spain, 1823; Lower Canada, 1930), while the Spanish code further divides them into gratuitous and for valuable consideration (art. 1, 823).

In England the common-law requisites of a guarantee in no way differ from those essential to the formation of any other contract. That is to say, they comprise the mutual assent of the creditor, the surety and the principal debtor, and the guarantee be under seal, valuable consideration. An offer to guarantee is not binding until it has been accepted, being revocable till then by the party making it. Unless, however, as sometimes happens, the offer contemplates an express acceptance, one may be implied, and it may be a question for a jury whether an offer of guarantee has in fact been accepted. Where the surety’s assent to a guarantee has been procured by fraud of the person to whom it is given, there is no binding contract. Such fraud may consist of suppression or concealment or misrepresentation. There is some conflict of authorities as to what facts must be spontaneously disclosed to the surety by the creditor, but it may be taken that the rule on the subject is less stringent than that governing insurances upon marine, life and other risks (The North British Insurance Co. v. Lloyd, 10 Exch. 523), though formerly this was denied (Owens v. Homan, 3 Mac. & G. 378, 397). Moreover, even where the contract relied upon is in the form of a policy guaranteeing the solvency of a surety for another’s debt, and is therefore governed by the doctrine of uberrima fides, only such facts as are really material to the risk undertaken (as, for example, in the cases of Bottom v. Bottom—Burnand v. Seaton, 1900, A.C. 135). As regards the competency of the parties to enter into a contract of guarantee, this may be affected by insanity or intoxication of the surety, if known to the creditor, or by disability of any kind. The ordinary disabilities are those of infants and married women—now in England greatly mitigated as regards the latter by the Married Women’s Property Acts, 1870 to 1893, which enable a married woman to contract, as a feme sole, to the extent of her separate property. Every guarantee not under seal must according to English law have a consideration to support it, though the least spark of one suffices (per Wilmot, J., in Pillan v. van Mierop and Hopkins, 3 Burr., at p. 1666; Haigh v. Brooks, 10 A. & E. 309; Barrett v. Trussell, 4 Taunt. 171), which, as in other cases, may consist either of some right, interest, profit or benefit accruing to the one party, or some forbearance, detriment, loss or responsibility given, suffered or undertaken by the other. In some guarantees the consideration is entire—as where, in consideration of a lease being granted, the surety becomes answerable for the performance of the covenants; in other cases it is fragmentary, i.e. supplied from time to time—as where a guarantee is given to secure the balance of a running account at a bank’s, or of a balance of a running account for goods supplied (per Lush, L. J., in Lloyd’s v. Harper, 16 Ch. Div., at p. 310). In the former case, the moment the lease is granted there is nothing more for the lessor to do, and such a guarantee as that of necessity runs on throughout the duration of the lease and is irrevocable. In the latter case, however, unless the guarantee stipulates to the contrary, the surety may at any time terminate his liability under the guarantee as to future
advances, &c. The consideration for a guarantee must not be past or executed, but on the other hand it need not comprise a direct benefit or advantage to either the surety or the creditor, but may solely consist of anything done, or any promise made, for the benefit of the principal debtor. It is more frequently executory than concurrent, taking the form either of forbearance to sue the principal debtor, or of a future advance of money or supply of goods to him.

By the Indian Contract Act 1872, sect. 127, it is provided that the consideration for a guarantee may consist of anything done or any promise made for the benefit of the principal debtor by the creditor. Total failure of the consideration stipulated for by the party giving a guarantee will prevent its being enforced, as it does not form part of either condition or an essential part of any contract. In construing the Statute of Frauds, it is the common law practice to construe all countries the mutual assent of two or more parties is essential to the formation of any contract (see e.g. Codes Civil, Fr. and Bel. 1108; Port. 643, 647 et seq.; Spain, 1258, 1261; Italy, 1104; Holl. 1336; Lower Canada, 984), a consideration is not everywhere regarded as a necessary element (see Pothier's Law of Obligations, Evans's edition, vol. ii. p. 19). Thus in Scotland a contract may be binding without a consideration to support it (Stair i. 10. 7).

The statutory requisites of a guarantee are, in England, prescribed by (1) the Statute of Frauds, which, with reference to guarantees, provides that "no action shall be brought whereby to charge the defendant upon any special promise to answer for the debt, default or miscarriages of another person, unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized," and (2) Lord Tenterden's Act (9 Geo. IV. c. 14), which by § 6 enacts that "no action shall be brought whereby to charge any person upon or by reason of any representation or assurance made or given concerning or relating to the character, conduct, credit, ability, trade or dealings of any other person, to the intent or purpose that such other person may obtain credit, money or goods upon" (i.e. "upon credit," see per Varke, B., in Lyde v. Barnard, 1 M. & W., at p. 104), "unless such representation or assurance be made in writing signed by the party to be charged therewith." This latter enactment, which applies to incorporated companies as well as to individuals (Hirst v. West Riding Union Banking Co., 1901, 1 K.B. 550 C.A.), was rendered necessary by an evasion of the Statute of Frauds, accomplished by treating the special promise to answer for another's debt, default or miscarriage, when not in writing, as required by that section, as a false and fraudulent representation concerning another's credit, solvency or honesty, in respect of which damages, as for a tort, were held to be recoverable (Pasley v. Freeman, 3 T.R. 51).

In Scotland, where, it should be stated, a guarantee is called a "cautionary obligation," similar enactments to those just specified are contained in § 6 of the Mercantile Law Amendment Act (Scotland) 1856, while in the Irish Statute of Frauds (7 Will. III. c. 12) there is a provision (§ 2) identical with that found in the English Statute of Frauds. In India a guarantee may be either oral or written (Indian Contract Act, § 120), while in the Australian colonies, Jamaica and Ceylon it must be in writing. The German code civil requires the surety's promise to be verified by writing where he has not executed the principal obligation (art. 766), and the Portuguese code renders a guarantee provable by all the modes established by law for the proof of the principal contract (art. 826). According to most codes civil now in force a guarantee like any other contract can usually be made verbally in the absence of witnesses and in certain cases (where for instance considerable sums of money are involved) sous signature privée or else by judicial or notarial instrument (see Codes Civil, Fr. and Bel. 1341; Spain, 1244; Port. 2506, 2513; Italy, 1341 et seq.; Pothier's Law of Obligations, Evans's ed. i. 257; Burge on Suretieship, p. 19; van der Linden's Institutes of Holland, p. 120; the French and Belgian Codes, moreover, provide that suretieship is not to be presumed but must always be expressed (art. 2015).

The Statute of Frauds does not invalidate a verbal guarantee, but renders it unenforceable by action. It may therefore be available in support of a defence to an action, and money paid under it cannot be recovered. An indemnity is not a guarantee within the statute, unless it contemplates the primary liability of a third person. It need not, therefore, be in writing when it is a mere promise to become liable for a debt, whenever the person to whom the promise is made should become liable (Wildes v. Dudlow, L.R. 10 Eq. 195; per Vaughan Williams, L.J., in Harburg India-Rubber Co. v. Martin, 1902, 1 K.B. p. 786; Guild v. Conrad, 1804, 2 Q.B. 885 C.A.). Neither does the statute apply to the promise of a del credere agent, which binds him, in consideration of the higher commission he receives, to make no false statement concerning the solvency of the person to whom a contract is entered into, and to make good all losses incurred thereby, even if such losses cannot be recovered, and renders him liable for any loss that may result from the non-fulfilment of his promise. A promise to give a guarantee is, however, within the statute, though not one to procure a guarantee.

The general principles which determine what are guarantees within the Statute of Frauds, as deduced from a multitude of decided cases, are briefly as follows: (1) the primary liability of a third person must exist or be contemplated as the foundation of the contract (Birkmy v. Darnell, 2 Sm. L.C. 11th ed. p. 295; Mountfitchet v. L.M.J. Co., 32 Ch. L.J. 127, 65 L.T. 161), where (2) the promise must be made to the creditor; (3) there must be an absence of all liability on the part of the surety independently of his express promise of guarantee; (4) the main object of the transaction between the parties to the guarantee must be the fulfilment of a third party's obligation (see Harburg India-Rubber Com. v. Martin, 1902, 1 K.B. 778, 786; and (5) the contract entered into must not amount to a sale by the creditor to the promisor of a security for a debt or of the debt itself (see de Colyar's Law of Guarantees and of Principal and Surety, 4th ed. pp. 65-161), where these principles are discussed in detail (by the light of decided cases there cited).

As regards the kind of note or memorandum of the guarantee that will satisfy the Statute of Frauds, it is now provided by § 3 of the Mercantile Law Amendment Act 1856, that "no special promise to be made, by any person after the passing of this act, to answer for the debt, default or miscarriage of another person, being in writing and signed by the party to be charged therewith, or some other person by him thereunto lawfully authorized, shall be deemed invalid to support an action, suit or other proceeding to charge the person by whom it has been made, by reason only that the consideration for such promise does not appear in writing or by necessary inference from a written document." Prior to this enactment, which is not retrospective in its operation, it was held in many cases that as the Statute of Frauds requires "the agreement to be in writing, all parts thereof were required so to be, including the consideration moving to, as well as the promise by, the party to be charged (Wain v. Walters, 5 East, 15; Saunders v. Wakefield, 4 B. & Ald. 393). These decisions, however, proved to be burdensome to the mercantile community, especially in Scotland and the north of England, and ultimately led to the alteration of the law, so far as guarantees are concerned, by means of the enactment already specified. Any writing embodying the terms of the agreement between the parties, and signed by the party to be charged, is sufficient; and the idea of agreement need not be present to the mind of the person signing (per Lindley, L.J., in In re Hoyle—Hoyle v. Hoyle, 1803, 1 Ch., at p. 98). It is, however, necessary that the names of the contracting parties should appear somewhere in writing; that the party to be charged, or his agent, should sign the memorandum or note of agreement, or else should cause another person having regard thereto, and that, when the note or memorandum is made, a complete agreement shall exist. Moreover, the memorandum must have been made before action brought, though it need not be contemporaneous with the agreement itself. As regards the stamping of the memorandum or note of agreement, a guarantee cannot, in England, be given in evidence unless properly stamped (Stamp Act 1891). A guarantee for the payment of goods, however, requires no stamp, being
GUARANTEE

within the exception contained in the first schedule of the act. Nor is it necessary to stamp a written representation or assurance as to character within 9 Geo. IV. c. 14, supra. If under seal, a guarantee requires sometimes an ad valorem stamp and sometimes a ten-shilling stamp; in other cases a sixpenny stamp generally suffices; and, on certain prescribed terms, the stamps can be affixed any time after execution (Stamp Act 1891, § 15, amended by § 15 of the Finance Act 1893).

The liability incurred by a surety under his guarantee depends upon its terms, and is not necessarily coextensive with that of the principal debtor. It is, however, obvious that as the surety's obligation is merely accessory to that of the principal it cannot as such exceed it (de Colyar, Law of Guarantees, 3rd ed. p. 233; Burge, Suretyship, p. 5). By the Roman law, if there were any such excess the surety's obligation was rendered wholly void and not merely void pro tanto. By many existing codes civil, however, a guarantee which imposes on the surety a greater liability than that of the principal debtor, difficult questions have arisen in England and America as to whether the surety is liable only for part of the debt equal to the limit of his liability, or, up to such limit, for the whole debt (Ellis v. Emmanuel, 1 Ex. Div. 157; Hobson v. Bass, 6 Ch. App. 702; Brandt, Suretyship, sec. 310). The surety cannot be made liable except for a loss sustained by reason of the default guaranteed against. Moreover, in the case of a joint and several guarantee by several sureties, unless all sign it none are liable thereunder (National Pro. Bk. of England v. Brackenbury, 1906, 22 Times L.R. 707). It was formerly considered in England to be the duty of the party taking a guarantee to see that it was couched in language enabling the party giving it to understand clearly to what extent he was binding himself (Nicholson v. Poget, 1 C. & M. 48, 52). This view, however, can no longer be sustained, it being now recognized that a guarantee, like any other contract, must, in cases of ambiguity, be construed against the party bound thereby and in favour of the party receiving it (Mayer v. Isaac, 6 M. & W. 605, 612; Wood v. Priesner, L.R. 2 Exch. 66, 71). The surety is not to be changed beyond the limits prescribed by his contract, which must be construed so as to give effect to what may fairly be inferred to have been the intention of the parties, from what they themselves have expressed in writing. In cases of doubtful import, recourse to parol evidence is permissible, to explain, but not to contradict the written evidence of the guarantee. As a general rule, the surety is not liable if the principal debt cannot be enforced, because, as already explained, the obligation of the surety is merely accessory to that of the principal debtor. It has never been actually decided in England whether this rule holds good in cases where the principal debtor is an infant, and on that account is not liable to the creditor. Probably in such a case the surety might be held liable by estoppel (see Kimball v. Newell, 7 Hill (N.Y.) 116). When directors guarantee the performance by their company of a contract which is ultra vires, and therefore not binding on the latter, the directors' suretyship liability is, nevertheless, enforceable against them (Yorkshire Railway Wagon Co. v. Moclure, 21 Ch. D. 309 C.A.).

It is not always easy to determine for how long a time liability under a guarantee endures. Sometimes a guarantee is limited to a single transaction, and is obviously intended to be security against one specific default only. On the other hand, it as often happens that it is not exhausted by one transaction on the faith of it, but extends to a series of transactions and remains a standing security until it is revoked, either by the act of the parties or else by the death of the surety. It is then termed a continuing guarantee. No fixed rules of interpretation determine whether a guarantee is a continuing one or not, but each case must be judged on its individual merits; and frequently, in order to achieve a correct construction, it becomes necessary to examine the surrounding circumstances, which often reveal what was the subject-matter which the parties contemplated when the guarantee was given, and likewise what was the scope and object of the transaction between them. Most continuing guarantees are either ordinary mercantile securities, in respect of advances made or goods supplied to the principal debtor or else bonds for the good behaviour of persons in public or private offices or employments. With regard to the latter class of continuing guarantees, the surety's liability is, generally speaking, revoked by any change in the constitution of the persons to or for whom the guarantee is given. On this subject it is now provided by section 18 of the Partnership Act 1890, which applies to Scotland as well as England, that "a continuing guarantee or cautionary obligation given either to a firm or to a third person in respect of the transactions of a firm, is, in the absence of agreement to the contrary, revoked as to future transactions by any change in the constitution of the firm to which, or of the firm in respect of the transactions of which the guaranty or obligation was given." This section, like the enactment it replaces, namely, sec. 4 of the Mercantile Law Amendment Act 1856, is mainly declaratory of the English common law, as embodied in decided cases, which indicate that the changes in the persons to or for whom a guarantee is given may consist either of an increase in their number, of a diminution thereof caused by death or retirement from business, or of the incorporation or consolidation of the persons to whom the guarantee is given. In this connexion it may be stated that the Government Offices (Security) Act 1875, which has been amended by the Statute Law Revision Act 1884, contains certain provisions with regard to the acceptance by the heads of public departments of guarantees given by companies for the due performance of the duties of an office or employment in the public service, and enables the Commissioners of His Majesty's Treasury to vary the character of any security, for good behaviour by public servants, given after the passing of the act.

Before the surety can be rendered liable on his guarantee, the principal debtor must have made default. When, however, this has occurred, the creditor, in the absence of express agreement to the contrary, may sue the surety, without even informing him of such default having taken place, or requiring him to pay, and before proceeding against the principal debtor or resorting to securities for the debt received from the latter. In those countries where the municipal law is based on the Roman civil law, sureties usually possess the right (which may, however, be renounced by them) originally conferred by the Roman law, of compelling the creditor to insist on the goods, &c. (if any) to which the guarantee is given. In this connexion it may be stated that Section 18 of the Bankruptcy Act 1869, as amended by the Insolvency Act 1876, § 130, and also by the Insolvency Act 1883, requires that the money, &c., must be actually sold, and appropriated to the liquidation of the debt guaranteed (see Codes Civ. Fr. and Bel. 2021 et seq.; Spain, 1830, 1831; Port. 830; Germany, 771, 772, 773; Holland, 1868; Italy, 1907; Lower Canada, 1904-1942; Egypt [mixed suits] 612; ibid. [native tribunals] 502), before having recourse to the sureties. This right, according to a great American jurist (Chancellor Kent in Hayes v. Ward, 4 Johns. New York, Ch. Cas. p. 132), "accords with a common sense of justice and the natural equity of mankind." In England this right has never been fully recognized. Neither does it prevail in America nor, since the passing of the Mercantile Law Amendment Act (Scotland) 1856, § 8, is it any longer available in Scotland where, prior to the last-named enactment, the benefit of discussion, as it is termed, existed. In England, however, before any demand for payment has been made by the creditor on the surety, the latter can, as soon as the principal debtor has made default, compel the creditor, on giving him an indemnity against costs and expenses, to sue the principal debtor if the latter be solvent and liable to pay (per A. L. Smith, L.J., in Rouxe v. Bradford Banking Company, 1804, 2 Ch. 75; per Lord Eldon in Wright v. Simpson, 6 Ves., at p. 733), and a similar remedy is also open to the surety in America (see Brandt on Suretyship, par. 205,
p. 290) though in neither of these countries nor in Scotland can one of several sureties, when sued for the whole guaranteed debt by the creditor, compel the latter to divide his claim amongst all the solvent sureties, and reduce it to the share and proportion of each surety. However, this beneficium divisionis, as it is called in Roman law, is recognized by many existing codes (Fr. and Bel. 2025-2027; Spain, 1837; Portugal, 835-836; Germany, 426; Holland, 1873-1874; Italy, 1911-1912; Lower Canada, 1946; Egypt [mixed suits], 615,616).

The usual mode in England of enforcing liability under a guarantee is by action in the High Court or in the county court. It is also permissible for the creditor to obtain redress by means of his country’s claim, in an action brought against him by the surety. On the other hand, the surety may now, in any court in which the action on the guarantee is pending, avail himself of any set-off which may exist between the principal debtor and the creditor. Moreover, if one of several sureties for the same debt is sued by the creditor or his guarantee, he can, by means of a proceeding termed a third-party notice, claim contribution from his co-surety towards the common liability. Independent proof of the surety’s liability under his guarantee must always be given at the trial; as the creditor cannot rely either on an admission for a judgment or award obtained against him (Ex parte Young In re ’Kitchin, 17 Ch. Div. 668). Should the surety become bankrupt either before or after default has been made by the principal debtor, the creditor will have to prove against his estate. This right of proof is now in England regulated by the 37th section of the Bankruptcy Act, 1883, which is most comprehensive in its terms.

A person liable as a surety for another under a guarantee possesses various rights against him, against the person to whom the guarantee is given, and also against those who may have become co-sureties in respect of the same debt, default or miscarriage. As regards the surety’s rights against the principal debtor, the latter may, where the guarantee was made with his consent but not otherwise (see Hodgson v. Shaw, 3 Myl. & K. at p. 190), after he has made default, be compelled by the surety to exonerate him from liability by payment of the guaranteed debt (per Sir W. Grant, M.R., in Antrobus v. Davidson, 3 Meriv. 506, 579; per Lindley, L.J., in Johnston v. Salvage Association, 19 Q.B.D. 466, 461; and see Wolmershausen v. Gullick, 1863, 1 L.T. 514). The moment, moreover, the surety has himself paid any portion of the guaranteed debt, he is entitled to rank as a creditor for the amount so paid, and to compel repayment thereof. In the event of the principal debtor’s bankruptcy, the surety can in England, if the creditor has not already proved in respect of the guaranteed debt, prove against the bankrupt’s estate, not only in respect of payments made before the bankruptcy of the principal debtor, but also, it seems, in respect of the contingent liability to pay under the guarantee (see Ex parte Delmar re Hereford, 1889, 38 W.R. 753), while if the creditor has already proved, the surety who has paid the guaranteed debt has a right to all dividends received by the creditor from the bankrupt in respect thereof, and to stand in the creditor’s place as to future dividends. This right is, however, often waived by the guarantee stipulating that, until the creditor has received full payment of all sums over and above the guaranteed debt, due to him from the principal debtor, the surety shall not participate in any dividends distributed from the bankrupt’s estate amongst his creditors. As regards the rights of the surety against the creditor, they are in England exactly similar to those in the first instance was a principal debtor, but has since become a surety, by arrangement with his creditor, duly notified to the creditor, though not even sanctioned by him. This was decided by the House of Lords in the case of Rouse v. The Bradford Banking Co., 1804, A.C. 586, removing a doubt created by the previous case of Swire v. Redman, 1 Q.B.D. 536, which must now be treated as overruled. The surety’s principal right against the creditor entitles him, after payment of the guaranteed debt, to the benefit of all securities, whether known to him (the surety) or not, which the creditor held against the principal debtor; and where, by default or laches of the creditor, such securities have been lost or rendered otherwise unavailable, the surety is discharged pro tanto. This right, which is not in abeyance till the surety is called on to pay (Dixon v. Steel, 1901, 2 Ch. 602), extends to all securities, whether satisfied or not, given before or after the contract of suretyship was entered into. On this subject the Mercantile Law Amendment Act, 1836, § 5, provides that “every person who being surety for the debt or duty of another, or being liable with another for any debt or duty, shall pay such debt or perform such duty, shall be entitled to have assigned to him, or to receive from him, every judgment, mortgage, act, or other security, which shall be held by the creditor in respect of such debt or duty, whether such judgment, mortgage, or other security shall or shall not be deemed at law to have been satisfied by the payment of the debt or performance of the duty, and such person shall be entitled to stand in the place of the creditor, and to use all the remedies, and, if need be, and upon a proper indemnity, to use the name of the creditor, in any action or other proceeding at law or in equity, in order to obtain from the principal debtor, or any co-surety, co-contractor, or co-debtor, as the case may be, or the person who shall have so paid such debt or performed such duty; and such payment or performance so made by such surety shall not be pleaded in bar of any such action or other proceeding by him, provided always that no co-surety, co-contractor, or co-debtor shall be entitled to recover from any other co-surety, co-contractor, or co-debtor, by the means aforesaid, more than the just proportion to which, as between those parties themselves, such last-mentioned person shall be justly liable.” This enactment is so far retrospective that it applies to a contract made before the act, where the breach thereof, and the payment by the surety, have taken place subsequently. The right of the surety to be subrogated, on payment by him of the guaranteed debt, to all the rights of the creditor against the principal debtor is recognized in America (Tobin v. Kirk, 80 New York S.C.R. 229), and many other countries (Codes Civil, Fr. and Bel. 2029; Spain, 1839; Port. 839; Germany, 774; Holland, 1877; Italy, 1916; Lower Canada, 2959; Egypt [mixed suits], 617; ibid. [native tribunals], 595).

As regards the rights of the surety against a co-surety, he is entitled to contribution from him in respect of their common liability. This particular right is not the result of any contract, but is derived from a general equity, on the ground of equality of burden and benefit, and exists whether the sureties be bound jointly, or jointly and severally, and by the same, or different, instruments. There is, however, no right of contribution where each surety is severally bound for a given portion only of the guaranteed debt; nor in the case of a surety for a security; (see In re Denlon’s Estate, 1904, 2 Ch. 178 C.A.); nor where a person becomes a surety jointly with another and at the latter’s request. Contribution may be enforced, either before payment, or as soon as the surety has paid more than his share of the common debt (Wolmershausen v. Gullick, 1803, 2 Ch. 514); and the amount recoverable is now always regulated by the number of solvent sureties, though formerly this rule only prevailed in equity. In the event of the bankruptcy of a surety, proof can be made against his estate by a co-surety for any excess over the latter’s contributive share. The right of contribution is not the only right possessed by co-sureties against each other, but they are also entitled to the benefit of all securities which have been taken by any one of them as an indemnity against the liability incurred for the principal debtor. The Roman law did not recognize the right of contribution amongst sureties. It is, however, sanctioned by many existing codes (Fr. and Bel. 2033; Germany, 426,474; Italy, 1920; Holland, 1881; Spain, 1844; Port. 845; Lower Canada, 1955; Egypt [mixed suits], 618, ibid. [native tribunals], 506), and also by the Indian Contract Act 1872, ss. 146-147.

The discharge of a surety from liability under his guarantee
may be accomplished in various ways, he being regarded, especially in England and America, as a "favoured debtor" (per Turner, L.), in Wheatley v. Bastow, 7 De G. M. & G. 279, 280; per Earl of Selborne, L.C., in In re Sherry—London and County Banking Co. v. Terry, 25 Ch. D., at p. 703; and see Brandt on Suretyship, sects. 79, 80). Thus, fraud subsequent to the execution of the guarantee (as where, for example, the creditor connives at the principal debtor's default) will certainly discharge the surety. Again, a material alteration made by the creditor in the instrument of guarantee after its execution may also have this effect. The most prolific ground of discharge, however, is usually traceable to causes originating in the creditor's laches or conduct, the governing principle being that if the creditor violates any rights which the surety possessed when he entered into the suretyship, even though the damage be nominal only, the guarantee cannot be enforced. On this subject it suffices to state that the surety's discharge may be accomplished:

(i) by a variation of the terms of the contract between the creditor and the principal debtor, or of that subsisting between the creditor and the surety (see Rickey v. Lewis, 22 T.L.R. 130);

(ii) by the creditor taking a new security from the principal debtor and discharging the original creditor from all liability (the creditor being liable if the principal debtor from liability);

(iii) by the surety's discharge of the creditor inconsistent with the surety's rights (see Fr. and Bel. 2023; Spain, 1852; Port. 835; Germany, 1776; Italy, 1928; Egypt [mixed suits], 623), though it may be mentioned that the rule prevailing in England, Scotland, America and India which releases the surety from liability where the creditor, by binding contract with the principal, extends without the surety's consent the time for fulfilling the principal obligation, while recognized by two existing civil codes (Spain, 1852; Port. 835), is rejected by the majority of them (Fr. and Bel. 2023; Holland, 1887; Italy, 1930; Lower Canada, 1856; Egypt [mixed suits], 613; ib. [native tribunals], 593); and see Morice, English and Dutch Law, p. 96; van der Linden, Institutes of Holland, pp. 120-121). A revocation of the contract of suretyship by act of the parties, or in certain cases by the death of the surety, may also operate to discharge the surety. The death of a surety does not be determined the guarantee, but, save where from its nature the guarantee is irrevocable by the surety himself, it can be revoked by express notice after his death, or, it would appear, by the creditor becoming affected with constructive notice thereof; except where, under the testator's will, the executor has the option of continuing the guarantee, in which case the executor should, it seems, specifically withdraw the guarantee in order to determine it. Where one of a number of joint and several sureties dies, the future liability of the survivors under the guarantee continues, at all events until it has been determined by express notice. Moreover, when three persons joined in a guarantee to a bank, and their liability thereunder was not expressed to be several, it was held that the death of one surety did not determine the liability of the survivors. In such a case, however, the estate of the deceased surety would be relieved from liability.

The Statutes of Limitation bar the right of action on guarantees under seal after twenty years, and on other guarantees after six years, from the date when the creditor might have sued the surety.

Morgan (1879); Troop, Validity of Verbal Agreements; Fell, Guaranties (2nd ed.); Theobald, Law of Principal and Surety; Brandt, Law of Sureties and Guaranties; article by de Colyars in Journal of Comparative Legislation (1905), on "Suretyship from the Standpoint of Comparative Jurisprudence." (H. A. de C.)

GUARATINGUETÁ, a city of Brazil in the eastern part of the state of São Paulo, 124 m. N.E. of the city of São Paulo. Pop. (1850) of the municipality, which includes a large rural district and the villages of Apparecida and Roseira, 35,690. The city, which was founded in 1651, stands on a fertile plain 3 m. from the Parahyba river, and is the commercial centre of one of the oldest agricultural districts of the state. The district produces large quantities of coffee, and some sugarcane, Indian corn and beans. Cattle and pigs are raised. The city dwellings are for the most part constructed of rough wooden frames covered with mud, called tapa by the natives, and roofed with curved tiles. The São Paulo branch of the Brazilian Central railway passes through the city, by which it is connected with Rio de Janeiro on one side and São Paulo and Santos on the other.

GUARDA, an episcopal city and the capital of an administrative district bearing the same name, and formerly in the province of Beira, Portugal, on the Guarda-Abantes and Liebon-Abantes railroads. Pop. (1900) 52,474. The city is situated 3370 ft. above sea-level, at the north-eastern extremity of the Serra da Estrela, overlooking the fertile valley of the river Coa. It is surrounded by ancient walls, and contains a ruined castle, a fine 16th-century cathedral and a sanatorium for consumptives. Its industries comprise the manufacture of coarse cloth and the sale of grain, wine and live stock. In 1199 Guarda was founded, on the site of the Roman Lencia Oppidiana, by Sancho I. of Portugal, who intended it, as its name implies, to be a "guard" against Moorish invasion. The administrative district of Guarda coincides with north-eastern Beira; pop. (1900), 26,630; area, 1665 sq. m.

GUARDI, FRANCESCO (1712-1793), Venetian painter, was a pupil of Canaletto, and followed his style so closely that his pictures are very frequently attributed to his more celebrated master. Nevertheless, the diversity, when once perceived, is sufficiently marked—Canaletto being more firm, solid, distinct, well-grounded, and on the whole the higher master, while Guardi is noticeable for spirited touch, sparkling colour and picturesquely sketched figures—in these respects being fully equal to Canaletto. Guardi sometimes coloured Canaletto's designs. He had extraordinary facility, three or four days being enough for producing an entire work. The number of his performances is large in proportion to this facility and to the love of gain which characterized him. Many of his works are to be found in England and seven in the Louvre.

GUARDIAN, one who guards or defends another, a protector. The O. Fr. guarden, garden, mod. garden, from guarder, garder, is of Teutonic origin, from the base war-, to protect, cf. O.H. Ger. warden, and Eng. "ward"; thus "guardian" and "warden" are etymologically identical, as are "guard" and "ward," cf. the use of the correlatives "guardian" and "ward," i.e., a minor, or person incapable of managing his affairs, under the protection or in the custody of a guardian. For the position of guardians of the poor see Poor Law, and for the legal relations between a guardian and his ward see Infant, Marriage and Roman Law.

GUARDS, and HOUSEHOLD TROOPS. The word guard is an adaptation of the Fr. garde, mod. garde, O. Ger. ward; see GUARDIAN. The practice of maintaining bodyguards is of great antiquity, and may indeed be considered the beginning of organized armies. Thus there is often no clear distinction between the inner ring of personal defenders and the select corps of trained combatants who are at the chief's entire disposal. Famous examples of corps that fell under one or both these headings are the "Immortals" of Xerxes, the Mamelukes, Janissaries, the Huscarles of the Anglo-Scotch kings, and the Russian Strelitz (Strelitzi). In modern times the distinction of function is better marked, and the fighting men who are more intimately connected with the sovereign than the bulk of the army can be classified as to duties into "Household Troops," "
who are in a sense personal retainers, and “Guards,” who are a corps d’élite of combatants. But the dividing line is not so clear as to any given body of troops. Thus the British Household Cavalry is part of the combatant army as well as the sovereign’s esquire.

The oldest of the household or bodyguard corps in the United Kingdom is the King’s Bodyguard of the Yeomen of the Guard (q.v.), formed at his accession by Henry VII. The “nearest guard,” the personal escort of the sovereign, is the “King’s Bodyguard of the Honourable Corps of Gentlemen-at-Arms,” created by Henry VIII. at his accession in 1509. Formed possibly on the pattern of the “Pensionnaires” of the French kings—retainers of noble birth who were the predecessors of the Maison du Roi (see below)—the new corps was originally called “the Pensioners.” The importance of such guards regiments in the general development of organized armies is illustrated by a declaration of the House of Commons, made in 1674, that the militia, the pensioners and the Yeomen of the Guard were the only lawful armed forces in the realm. But with the rise of the professional soldier and the corresponding disuse of arms by the nobles and gentry, the Gentlemen-at-Arms (a title which came into use in James II.’s time, though it did not become that of the corps until William IV.’s) retaining their noble character, became less and less military. Burke attempted without success in 1782 to restrict membership to officers of the army, but the success of giving the corps an almost purely military character became obvious when, on the occasion of a threatened Chartist riot, it was called upon to do duty as an armed body at St James’s Palace. The corps was reconstituted on a purely military basis in 1862, and from that date only military officers of the regular services who have received a war decoration are eligible for appointment. The office of captain, however, is political, the holder (who is always a peer) vacantg it on the resignation of the government of which he is a member. The corps consists at present of captain, lieutenant, standard bearer, trumpeter, the colonel’s officer, and four gentlemen-at-arms. The uniform consists of a scarlet swallow-tailed coat and blue overalls, with gold epaulettes, brass dragon helmet with drooping white plume and brass box-spers, these last contrasting rather forcibly with the partisan, an essentially infantry weapon, that they carry.

The Royal Company of Archers.—The king’s bodyguard for Scotland was constituted in its present form in the year 1670, by an act of the House of Lords. Although the colonel was originally appointed by the company for the company, some connecting it with a supposed archer guard of the kings of Scotland. In the above-mentioned year, 1670, the usual regulations of the company were made, including, stating, that owing to “the noble and useful recreation of archery long for too much neglected, several noblemen and gentlemen did associate themselves in a company for encouragement thereof . . . and did agree and consent for the preservation thereof granted.” For about twenty years at the end of the 17th century, perhaps owing to the adhesion of the majority to the Stuart cause, its existence seems to have been suspended. But in 1703 a new captain-general, Sir George Mackenzie, Viscount Tarbat, afterwards earl of Cromarty (1630-1714), was elected, and he procured for the company a new charter from Queen Anne. The rights and privileges renewed or conferred by this charter were to be held of the crown for the reddendo of a pair of barbed arrows. This reddendo was paid to George IV. at Holyrood in 1822, to Queen Victoria in 1842 and to King Edward VII. in 1903. Thehistory of the Royal Company since 1703 has been one of great prosperity. Large parades were frequently held, and many distinguished men marched in the ranks. Several of the leading insurgents in 1745 were members, but the company was not at that time summoned in a military capacity.

In 1822 when King George IV. visited Scotland, it was thought appropriate that the Royal Company should act as his majesty’s bodyguard during his stay, especially as there was a tradition of a former visit of King Charles II. to Scotland. The six officers usually assigned to the gentlemen-at-arms. When Queen Victoria visited the Scottish capital in 1832, the Royal Company again did duty; the last time they were called out in her reign in their capacity of royal bodyguard was in 1846, when they were on parade during the Edinburgh Volunteer review in the Queen’s Park, Edinburgh. They acted in the same capacity when King Edward VII. reviewed the Scottish Volunteers that year, on 27th November 1901.

King George IV. authorized the company to take, in addition to their former name, that of “The King’s Body Guard for Scotland,” and presented to the captain-general a gold stick, thus constituting the company part of the royal household. In virtue of this stick the captain-general of the Royal Company takes his place at a coronation and inherits the office of the ancient Juicer or chief of the sword-bearer given to the Lord High Steward of Scotland, and the gold stick of England. The lieutenant-general of the company have silver sticks; and the council, which is the executive body of the company, possess various ceremonial emblems. The uniform is a scarlet coat, blue gaiters and white plume. The officers wear red in place of a crimson one, and an enseigne on the left shoulder. All ranks wear swords. The field dress at present consists of a dark green tunic, shoulder-wings and gauntletted cuffs and trousers trimmed with black and crimson; a bow-case worn as a sash, of the same colour as the coat, black waistcoat with sword, and Balmoral busk, which is this model’s peculiarity. In 1905, the officers of the company are the captain-general, 4 captains, 4 lieutenants, 4 ensigns, 12 brigadiers and adjutant.

Guards

Corps of the gentlemen-at-arms or yeoman type do not of course count as combatant troops—if for no other reason at least because they are armed with the weapons of bygone times. Colonel Clifford Walton states in his History of the British Standing Army that neither the Yeomen of the Guard nor the Pensioners were ever subject to martial law. The British guards and household troops that are armed, trained and organized as a principal part of the army are the Household Cavalry and the Foot Guards.

The Household Cavalry consists at the present day of three regiments, and has its origin, as have certain of the Footguard regiments, in the ashes of the “New Model” army disbanded at the restoration of Charles II. in 1660. In that year the “1st or His Majesty’s Own Troop of Guards” formed during the king’s exile of his cavalier followers, was taken on the strength of the army. The 2nd troop was formerly in the Spanish service as the “Duke of York’s Guards,” and was also a cavalier unit. In 1670, on Monmouth’s death, the original 3rd troop (Mong’s Life Guards, renamed in 1660 “the Royal Horse Guards”) under Philip Chudleigh became the 2nd (the queen’s) troop, and the Duke of York’s troop the 3rd. In 1685 the 1st and 2nd troops were styled Life Guards of Horse, and two years later the blue-uniformed “Royal Regiment of Horse,” a New Model regiment that had been disbanded and at once re-raised in 1660, was made a household cavalry corps. Later under the colonelcy of the earl of Oxford it was popularly called “The Oxford Blues.” There were also from time to time other troops (e.g. Scots troops 1700-1746) that have disappeared. In 1746 the 2nd troop was disbanded, but it was reorganized in 1788, and in 1793, the 2nd and 3rd troopers were given their present title of 1st and 2nd Life Guards. From 1750 to 1810 the Blues bore the name of “Royal Horse Guards Blue,” which in 1819 was changed to “Royal Horse Guards (The Blues).” The general distinction between the uniforms of the red Life Guard and the blue Horse Guard still exists. The 1st and the 2nd regiments of Life Guards wear scarlet tunics with blue collars and cuffs, and the Royal Horse Guards blue tunics with scarlet collars and cuffs. All three wear steel cuisses on state occasions and on guard duty. The head-dress is a steel helmet with drooping horse-hair plume (white for Life Guards, red for Horse Guards). In full dress white leather boot-top pantaloons and long knee boots are worn. Amongst the peculiarities of these corps d’élite is the survival of the old custom of calling non-commissioned officers “corporal of horse” instead of sergeant, and corporal-major instead of sergeant-major, the wearing by trumpeters and drummers in full dress of a black velvet cap, a richly laced coat with a full skirt extending to the wearer’s knees and long white gaiters. There is little distinction between the two Life Guards regiments’ uniforms, the most obvious point being that the corporals and privates, through the white leather pouch belt is red for the 1st and blue for the 2nd.

The Foot Guards comprise the Grenadier Guards, the Coldstream Guards, the Scots Guards and the Irish Guards, each (except the last) of three battalions. The Grenadiers, originally the First Foot Guards, represent a royalist infantry regiment which served with the exiled princes in the Spanish army and returned at the Restoration in 1660. The Coldstream Guards
are a New Model regiment, and were originally called the Lord General’s (Monk’s) regiment of Foot Guards. Their popular title, which became their official designation in 1670, is derived from the fact that the army with which Monk restored the monarchy crossed the Tweed into England at the village of Coldstream, and that his troopers (which were afterwards, except the two units of horse and foot of which Monk himself was colonel, disbanded) were called the Coldstreamers. The two battalions of Scots Foot Guards, which regiment was separately raised and maintained in Scotland after the Restoration, marched to London in 1686 and 1688 and were brought on to the English Establishment in 1709. In George III’s reign they were known as the 1st and 2nd Guards, respectively (though when the present title was adopted) they were the Scots Fusiliers Guard.

The Irish Guards (one battalion) were formed in 1902, after the South African War, as a mark of Queen Victoria’s appreciation of the services rendered by the various Irish regiments of the line. The dress of the Foot Guards is generally similar in all four regiments, scarlet tunic with blue collars, cuffs and shoulder-straps, blue trousers and high, rounded bearskin cap. The regimental distinctions most easily noticed are these. The Grenadiers wear a small white plume in the bearskin, the Coldstreamers a yellow plume, and the Irish a red one. The buttons on the tunic are spaced evenly for the Grenadiers, by twos for the Coldstreamers, by threes for the Scots and by fours for the Irish. The band of the modern cap is red for the Grenadiers, white for the Coldstreamers, “diced” red and white (chequeurs) for the Scots and green for the Irish. Former privileges of foot guard regiments, such as higher berth rank in the army for their regimental officers, are now abolished, but Guards are still subject exclusively to the command of their own officers, and the officers of the Foot Guards, like those of the Household Cavalry, have special duties at court. Neither the cavalry nor the infantry guards serve abroad in peace time as a rule, but in 1909 a battalion of the Guards, which was at that time proposed to disband, was sent to Egypt. “Guards’ Brigades” served in the Napoleonic Wars, in the Crimea, in Egypt at various times from 1887 to 1889 and in South Africa 1899–1902. The last employment of the Household Cavalry as a brigade in war was at Waterloo, but composite regiments made up from officers and men of the Life Guards and Blues were employed in Egypt and in South Africa.

The Household Cavalry had Guards in their service in Mercian times, and their household forces appear from time to time in the history of medieval wars. Louis XI. was, however, the first to regularize their somewhat loose organization, and he did so to such fine effect that within less than 30 years the Guard was organized, subdivided and permanently under arms. The senior unit of the Gardes du Corps was the famous company of Scottish archers (Mousquetaires) of the old French Guard. It was originally formed (1418) from the Scottish contingents that assisted the French in the Hundred Years’ War. Scott’s Quentin Durward gives a picture of life in the corps as it was under Louis XI. In the following century, however, its regimental history becomes somewhat confused. Two French companies were added by Louis XI, and Francis I. and the Gardes du Corps came to consist exclusively of cavalry. About 1654 nearly all the Scots then serving went into the “régiment d’Hilbon” and thence later into the British regular army (see HEBURN, SIR JOHN). Thereafter, though the titles, distinctions and privileges of the original Archer Guard were retained in part, and its officers were permitted from thereafter being (at any rate at first) given to those of Scottish descent. At its disbandment in 1791 along with the rest of the Gardes du Corps, it contained few, if any, native Scots. There was also, for a short time (1643–1660), an infantry regiment of Gardes écaissés.

In 1671 the title of Maison Militaire du Roi was applied to that portion of the household that was distinctively military. It came to consist of two regiments of the corps de Garde, or corps de Mousquetaires (cavalry) (formed 1622 and 1660), 1 company of Chevau-légers (1570), 1 of Gendarmes de la Maison Rouge, and 1 of Gendarmes à Cheval (1676), with 1 company of Garde de la Porte and one of Garde de la Cité. The latter were the last remnants of the large establishment, which did not include all the guard regiments, was considerably reduced by the Count of St Germain’s reforms in 1755, all except the Gardes du Corps and the Gén. Suisses being disbanded. The whole of the Maison du Roi, with the exception of the semi-military bodies referred to, was cavalry.

The Gardes françaises, formed in 1553, did not form part of the Maison. They were an infantry regiment, as were the famous Scottish and Swiss regiments, originally recruited as lancers of Religion, which was, for good conduct at the battle of Arques, incorporated in the permanent establishment by Henry IV. In 1615 they formed the Guard of the King’s Presence (as its expectation, the French Guards sided openly with the Constitutional movement and were disbanded. The Swiss Guards, however, being foreigners, and therefore unaffected by civil troubles, retained their discipline, and in the court of the Tuileries, where after they were sacrificed by their master to the bullets of the Marseillais and the pikes of the mob (August 10, 1792). Their tragic fate is so well known that only a few details need be given. By order of the Directory, the work of Thorvaldsen, erected near Lucerne in 1829. The “Constitutional,” “Revolutionary” and other guards that were created after the abolition of the Maison and the slaughter of the Swiss are unimportant, but through the “Directory Guard” they form a nominal link between the household troops of the monarchy and the corps which is perhaps the most famous “Guard” in history. The Imperial Guard of Napoleon had its beginnings in an escort squadron called the Corps of Guards, which accompanied him in the Italian campaign 1796–1797 and in Egypt. On becoming First Consul in 1799 he built up out of this and of the personal guard to which it was attached (Directoire Consulat Guard, and this, which was more of a fighting unit than a personal bodyguard, took part in the battle of Marengo. The Imperial Guard, into which it was converted on the establishment of the Consulate, was about one regiment. As such it took part in the Austerlitz and Jena campaigns, but after the conquest of Prussia Napoleon augmented it, and divided it into three parts. The “1st Guard” was formed in 1804, the “Middle Guard” was created, and by successive augmentations the corps of the guard had grown to 57,000 strong in 1811–1812 and 81,000 in 1813. It preserved its general character as a corps d’élite of colored regiments, but from about 1813 the “Young Guard” was recruited directly from the best of the annual conscript contingent. The officers held a higher rank in the army than their regimental rank in the Guards, and the number of the Imperial Guard was made to revive the Maison du Roi, but in the constitutional regime of the second Restoration this semi-medieval form of body-guard was given up and replaced by the Garde Royale, a selected and expert body of personal bodyguards. The Garde Royale, however, had the portion of it fought in Algeria, but it was disbanded at the July Revolution. Louis Philippe had no real guard troops, but the memories of the Imperial Guard were revived by Napoleon III., who formed a large guard corps in 1853–1854. This, however, was open to an even greater degree than Napoleon I.’s guard to the objection that it took away the best soldiers from the line. Since the fall of the Empire in 1870 there have been no guard troops in France. The duty of watching over the safety of the president is taken in the ordinary roster of duty by the troops stationed in the capital. The Revolutionary Guard is the Paris gendarmerie, reputed to be old stock and thus more discipline than anything.

In Austria-Hungary there are only small bodies of household troops (Archer Body Guard, Trabant Guard, Hungarian Crown Guards, &c.) analogous to the British Gentlemen at Arms or Yeomen of the Guard. “Noibad巡卫,” to which the latter are known, is maintained in the Vatican. The court troops of Spain are called “halberdiers” and armed with the halbert.

In Russia the Guard is organized as an army corps. It possesses special privileges, particularly as regards officers’ advancement. In Germany the distinction between armed retainers and “Guards” is well marked. The Army is for practical purposes a unit under imperial control, while household troops (‘castle-guards’ as they are individually called) are an independent military formation within the empire. The “Guards,” as a combatant force in the army are those of the king of Prussia and constitute a strong army force. In Germany and Austria, however, the Guards have an essentially ceremonial function in the state. In Great Britain, the functions of the heavy cavalry regiments of the Guard preserve to some extent the name and character of a body guard (Gardes du Corps). The senior foot guard regiment is the “Coldstream Guards” and the senior cavalry regiment of a palace-guard to a combatant force is due chiefly to Frederick William I., to whom drill was a ruling passion, and who substituted effective regiments for the ornamental forces of the old Stuarts. His followers, however, further substituted by Frederick the Great in substituting for Frederick William’s expensive “giant” regiment of guards a larger number of ordinary soldiers, whom he subjected to rigorous training in order to distinguish them from the imperial guards. The Guard was also formed into a “Young Guard” of which the Great also formed the Body Guard alluded to above. Nevertheless in 1806 the Guard still consisted only of two cavalry regiments and four infantry regiments, and it was the example of Napoleon’s army that determined the further development of this corps. In 1813 its strength was that of a weak division, but in 1860 by slight but frequent augmentations it had come to consist of an army corps, complete with all auxiliary services. A few guard

1 The "Irish Guards" of the Stuarts took the side of James II. against William III. in Ireland and lost their regimental identity in the French service to which the officers and soldiers transferred themselves on the abandonment of the struggle.
regiments belonging to the minor sovereigns are counted in the line. Conse- quently, in war the Guard is employed as a unit, like other army corps. It is recruited by the assignment of selected young men of each annual contingent, and is thus free from the reproach of the French Imperial Guard, which took the best-trained soldiers from the rest of the line.

GUARD-SHIP, a warship stationed at some port or harbour to act as a guard, and in former times in the British navy to receive the men impressed for service. She usually was the flagship of the admiral commanding on the coast. A guard-boat is a boat which goes the round of a fleet at anchor to see that due watch is kept at night.

GUÁRICO, a large inland state of Venezuela created by the territorial redivision of 1904, bounded by Aragua and Miranda on the N., Bermúdez on the E., Sucre on the S., and Monagas and Trujillo on the W. Pop. (1935 estimate), 78,117. It extends across the northern Branches to the Orinoco and Aposer rivers and is devoted almost wholly to pastoral pursuits, exporting cattle, horses and mules, hides and skins, cheese and other products. The capital is Cabo Rojo, and the other principal towns are Camagüén (pop. 3648) on the Portuguese river, Guayabal (pop. 3146), on a small tributary of the Guárico river, and Zara (pop. 14,546) on the Unare river, nearly 150 m. S.E. of Caracas.

GUARIENTO, sometimes incorrectly named GUERRIERO, the first Paduan painter who distinguished himself by finely painted miniatures. The career of Guariento is not clear. It is said he was born in 1355, when, having already acquired high renown in his native city, he was invited by the Venetian authorities to paint a Paradise, and some incidents of the war of Spoleto, in the great council-hall of Venice. These works were greatly admired at the time, but have long ago disappeared under repainting. His works in Padua have suffered much. In the church of the Eremitani are allegories of the Planets, and, in its choir, some small sacred histories in dead colour, such as an Ecce Homo; also, on the upper walls, the life of St Augustine, with some other subjects. A few fragments of the Masaccio frescoes by Guariento are still extant in Padua. In the gallery of Bassano is a Crucifixion, finely executed, and somewhat superior to a merely traditional method of handling, although on the whole Guariento must rather be classed in that school of art which preceded Cimabue than as having advanced in his vestiges; likewise two other works in Bassano, ascribed to the same hand. The painter is buried in the church of S. Bernardino, Padua.

GUARINI, CAMILLO-GUARINI (1624-1683), Italian monk, writer and architect, was born at Modena in 1624. He was at once a learned mathematician of literature and philosophy at Messina, and, from the age of seventeen, was architect to Duke Filibert of Savoy. He designed a very large number of public and private buildings at Turin, including the palaces of the duke of Savoy and the prince of Cagiano, and many public buildings at Modena, Verona, Vienna, Prague, Liébon and Paris. He died at Milan in 1683.

GUARINI, GIOVANNI BATTISTA (1537-1612), Italian poet, author of the Pastor fido, was born at Ferrara on the 20th of December 1537, just seven years before the birth of Tasso. He was descended from Guarino da Verona. The young Battista studied both at Pisa and Padua, whence he was called, when not yet twenty, to profess moral philosophy in the schools of his native city. He inherited considerable wealth, and was able early in life to marry Taddea de' Bendetti, a lady of good birth. In 1567 he entered the service of Alphonso II, duke of Ferrara, thus beginning the court career which was destined to prove a constant source of disappointment and annoyance to him. Though he cultivated poetry for pastime, Guarini aimed at state employment as the serious business of his life, and managed to be sent on various embassies and missions by his ducal master. There was, however, at the end of the 16th century no opportunity for a man of energy and intellectual ability to distinguish himself in the petty sphere of Italian diplomacy. The time had passed when the profession of a courtier, painted in such glowing terms by Castiglione, could confer either profit or honour. It is true that the court of Alphonso presented a brilliant spectacle to Europe, with Tasso for titular poet, and an attractive circle of accomplished ladies. But the last duke of Ferrara was an illiberal patron, feeding his servants with promises, and ever ready to treat them with the brutality that condemned the author of the Jerusalemme Liberata to a madhouse. Guarini spent his time and money to little purpose, suffered from the spite and ill-will of two successive secretaries,—Pigna and Montecatini,—quarrelled with his old friend Tasso, and at the end of fourteen years of service found himself half-rueved, with a large family and no prospects. When Tasso was condemned to S. Anna, the duke promoted Guarini to the vacant post of court poet. There is an interesting letter extant from the latter to his friend Cornelio Bentivoglio, describing the efforts he made to fill this place appropriately. "I strove to transform you into a poet, so that the character, costume and feelings of your youth. In manhood, I forced myself to look young; I turned my natural melancholy into artificial gaiety, affected loves I did not feel, exchanged wisdom for folly, and, in a word, passed from a philosopher into a poet." How ill-adapted he felt himself to this masquerade life may be gathered from the following sentence: "I am already in my forty-fourth year, the father of eight children, two of whom are old enough to be my censors, while my daughters are of an age to marry." Abandoning so unequipped to bury the existence of a man of robust and virile intellect, ambitious of greatness, confident in his own powers, and well qualified for serious affairs, whose energies found no proper scope for his exercise. Literary work offered but a poor sphere for such a character, while the enforced inactivity of court life soured a naturally capricious and choleric temper. Of poetry he spoke with a certain tone of condescension, professing to practise it only in his leisure moments; nor are his miscellaneous verses of a quality to secure for his author a very lasting reputation. He is therefore not a little remarkable that the fruit of his retirement—a disappointed courtier who, besides the prime of early manhood—should have waited to be slowly absorbed by the capacious appetite of Austria, to find no place for a man of energy and independence. Guarini finally took refuge in his native Ferrara, which, since the death of Alphonso, had now devolved to the papal see. Here, and at the Villa Guarina, his last years were passed in study, lawsuits, and polemical disputes with his contemporary critics, until 1612, when he died at Venice in his seventy-fifth year.
The *Pastor fido* (first published in 1590) is a pastoral drama composed not without reminiscences of Tasso's *Aminta*. The scene is laid in Arcadia, where Guarini supposes it to have been the custom to sacrifice a maiden yearly to Diana. But an oracle has declared that when two scions of divine lineage are united in marriage, and a faithful shepherd has atoned for the ancient error of a faithless woman, this inhuman rite shall cease. The plot turns upon the unexpected fulfillment of this prophecy, contrary to all the schemes which had been devised for bringing it to accomplishment, and in despite of apparent impossibilities of divers kinds. It is extremely elaborate, and, regarded as a piece of cunning mechanism, leaves nothing to be desired. Each motive has been carefully prepared, each situation amply developed. Yet, considered as a play, the *Pastor fido* disappoints a reader trained in the school of Sophocles or Shakespeare. The action itself seems to take place off the stage, and only the results of action, stationary tableaux representing the movement of the drama, are put before us in the scenes. The art is lyrical, not merely in form but in spirit, and in adaptation to the requirements of music which demands stationary expressions of emotion for development. The characters have been well considered, and are exhibited with great truth and vividness; the cold and eager hunter Silvio contrasting with the tender and romantic Mirtillo, and Corisca's mercerious arts enhancing the pure affection of Amarielli. Dorinda presents another type of love so impulsive that it prevails over a maiden's sense of shame, while the courtier Carino brings the corruption of towns into comparison with the innocence of the country. In Carino the poet painted his own experience, and here his satire upon the court of Ferrara is none the less biting because it is gravely measured. In Corisca he delineated a woman vitiated by the same town life, and a very hideous portrait has he drawn. Though a satirical element was thus introduced into the *Pastor fido* in order to relieve its ideal picture of Arcadia, the whole play is but a study of contemporary feeling in Italian society. There is no true rusticity whatever in the drama. This correspondence with the spirit of the age secured its success during Guarini's lifetime; this made it so dangerously seductive that Cardinal Bellarmine told the poet he had done more harm to Christendom by his blandaishments than Luther by his heresy. Without anywhere transgressing the limits of decorum, the *Pastor fido* is steeped in sensuousness; and the immodesty of its pictures is enhanced by rhetorical conceits more provocative than nudity. Moreover, the love described is effeminate and wan--yon felt less as passion than as lust enveloped in a veil of sentiment. We divine the coming age of *cissi e castrali*. Of Guarini's style it would be difficult to speak in terms of too high praise. The thought and experience of a lifetime have been condensed in these five acts, and the language is at once genuine, brilliant, classical, chiselled to perfection. Here and there the taste of the 17th century makes itself felt in frigid conceits and forced antitheses; nor does Guarini abstain from sententious maxims which reveal the moralist rather than the poet. Yet these are but minor blemishes in a master-piece of diction, glittering and faultless like a polished bas-relief of hard Corinthian bronze. That a single pastoral should occupy so prominent a place in the history of literature seems astonishing, until we reflect that Italy, upon the close of the 16th century, expressed itself in the *Pastor fido* and that the influence of this drama was felt through all the art of Europe till the epoch of the Revolution. It is not a mere play. The sensal refinement proper to an age of social decadence found in it the most exact embodiment, and made it the code of gallantry for the next two centuries.

The best edition of the *Pastor fido* is the 20th, published at Venice (Cotti) in 1602. The most convenient is that of Barberea (Florence, 1832). The printings of Barbelli and Ferrara, also, published in 4 vols., 1737, may be consulted. His polemical writings, *Verato primo e secondo*, and his prose comedy called *Idropeia*, were published at Venice, Florence and Rome, between 1586 and 1612.

GUARINO, also known as VARINUS, and surnamed from his Birthplace Favorinus, Phavorinus of Camers (c. 1450-1537), Italian lexicographer and scholar, was born at Faveva near Camerino, studied Greek and Latin at Florence under Politian, and afterwards became for a time the pupil of Lascaris. Having entered the Benedictine order, he now gave himself with great zeal to Greek lexicography; and in 1496 published his *Thesaurus cornucopieae et horti Adonis*, a collection of thirty-four grammatical tracts in Greek. He for some time acted as tutor to Giovanni dei Medici (afterwards Leo X.), and also held the ager of the keeper of the Medecine library at Florence. In 1514 Leo appointed him bishop of Nocera. In 1517 he published a translation of the *Apolphthegmata* of Joannes Stobaeus, and in 1523 appeared his *Etymologicum Magnum, sive thesaurus universae linguae Graecae ex multis variisque autoriibus collectus*, a compilation which has been frequently reprinted, and which has laid subsequent scholars under great debt though not always acknowledged obligations.

GUARINO [GUARINUS] DA VERONA (1370-1460), one of the Italian restorers of classical learning, was born in 1370 at Verona, and studied Greek at Constantinople, where for five years he was the pupil of Manuel Chrysochloras. When he set out on his return to Italy he was the happy possessor of two cases of precious Greek MSS, which he had been at great pains to collect; it is said that the loss of one of these by shipwreck caused him such distress that his hair turned grey in a single night. He supported himself as a teacher of Greek, first at Verona and afterwards in Venice and Florence; in 1436 he became, through the patronage of Lionel, marquis of Este, professor of Greek at Ferrara; and in 1438 and following years he acted as interpreter for the Greeks at the councils of Ferrara and Florence. He died at Ferrara on the 14th of December 1460. His principal works are translations of Strabo and of some of the Lives of Plutarch, a compendium of the Greek grammar of Chrysolora, and a series of commentaries on Persius, Juvenal, Martial and on some of the works of Aristotle and Cicero. See Rosmini, *Vita e disciplina di Guarino* (1805-1806); Sabadino, *Guarino Veronese* (1885); Sandys, *Hist. Class. Schol. ii. (1908).

GUARNIERI, or GUARNERIUS, a celebrated family of violin-makers of Cremona. The first was Andreas (c.1626-1698), who worked with Antonio Stradivari in the workshop of Nicolo Amati (son of Geronimo). Violins of a model original to him are dated from the sign of "St Theresa" in Cremona. His son Joseph (1634-1725) made instruments at first like his father's, but later in a style of his own with a narrow waist; his son, Peter of Venice (b. 1605), was also a fine maker. Another son of Andreas, Peter (Pietro Giovanni), commonly known as "Peter of Cremona" (b. 1635), moved from Cremona and settled at Mantua, where he too worked "sub signo Sanctae Tereseae." Peter's violins again showed considerable variations from those of the other Guarneri. Hart, in his work on the violin, says, "There is increased breadth between the sound-holes; the sound-hole is rounder and more perpendicular; the middle bouts are more contracted, and the model is more raised."

The greatest of all the Guarneri, however, was a nephew of Andreas, Joseph del Gesu (1687-1745), whose title originates in the I.I.S. inscribed on his tickets. His master was Gaspar di Salo. His conception follows that of the early Brescian makers in the boldness of outline and the massive construction which aim at the production of tone rather than visual perfection of form. The great variety of his work in size, model, &c., represents his various experiments in the direction of discovering this tone. A stain of sap-mark, parallel with the finger-board on both sides, appears on the bellies of most of his instruments. Since the middle of the 18th century a great many spurious instruments ascribed to this master have poured over Europe. It was not until Paganini played on a "Joseph" that the taste of amateurs turned from the sweetness of the Amati and the Stradivarius violins in favour of the robust tone of the Joseph Guarnerius. See VIOLIN.

GUASTALLA, a town and episcopal see of Emilia, Italy, in the province of Reggio, from which it is 18 m. N. by road, on the S. bank of the Po, 79 ft. above sea-level. It is also connected by rail with Parma and Mantua (via Suzzara). Pop.
GUATEMALA (1901), 2638 (town); 11,991 (commune). It has 16th-century fortifications. The cathedral, dating from the 10th century, has a magnificent altarpiece. The city was founded by the Lombards in the 7th century; in the church of the Pieve Pope Paschal II. held a council in 1107. In 1507 it was seized by Giberto da Correggio of Parma. In 1493 it passed to Guido Torello, cousin of Filippo Maria Visconti of Milan. In 1539 it was sold by the last female descendant of the Torelli to Ferrante Gonzaga. In 1621 it was made the seat of a duchy, but in 1748 it was added to those of Parma and Piacenza, whose history it subsequently followed.

GUATEMALA (somewhat incorrectly written Guatemala), a republic of North America, ceded to the republic of Guatemala and to its chief city, but formerly given to a captaincy-general of Spanish America, which included the fifteen provinces of Chiapas, Suchitepequez, Escuintla, Sonsonate, San Salvador, Vera Paz and Peten, Chiquimula, Honduras, Nicaragua, Costa Rica, Totoxicapam, Quezaltenango, Sololá, Chimaltenango and Sacatepequez,—or, in other words, the whole of Central America (except Panama) and part of California. The name is probably of Aztec origin, and is said by some authorities to mean in its native form Quauhltamatan, "Land of the Eagle," or "Land of the Thunderbird." It was in fact used by the Spaniards, and is connected with the volcano of agua (i.e. "water"), and is interpreted as "mountain-vomiting water."

The republic of Guatemala is situated between 13° 42' and 17° 49' N., and 88° 10' and 92° 30' W. (For map, see Central America.) Pop. (1900), 1,842,134; area about 48,239 sq. m. Guatemala is bounded on the W. and N. by Mexico, N.E. by British Honduras, E. by the Gulf of Honduras, and the republic of Honduras, S.E. by Salvador and S. by the Pacific Ocean. The frontier towards Mexico was determined by conventions of the 27th of September 1822, the 17th of October 1853, the 1st of April 1893, and the 5th of May 1898. Starting from the Pacific, it ascends the river Suchiate, then follows an irregular line towards the north-east, till it reaches the parallel of 17° 49' N., along which it runs to the frontier of British Honduras. This frontier, by the convention of the 9th of July 1893, coincides with the meridian of 89° 20' W., till it meets the river Sarstoon or Sarstun, which it follows eastwards to the Gulf of Honduras.

Physical Description.—Guatemala is naturally divided into five regions—the lowlands of the Pacific coast, the volcanic mountains of the central highlands, and the so-called "Sierra Madre," or the mountains of the Atlantic versant and the plain of Peten. (1) The coastal plains extend along the entire southern seacoast, with a mean breadth of 50 m., and link together the belts of similar terrains of Peten and the Guatemalan mainland. Owing to their tropical heat, low elevation above sea-level, and marshy soil, they are thinly peopled, and contain few important towns except the seaports. (2) The precipitous barrier of the Sierra Madre, which closes in the coastal plains on the north, is similarly prolonged into Salvador and Mexico. It is known near Guatemala city as the Sierra de las Nubes, and enters Mexico as the Sierra de Istatan. It forms the main watershed between the Pacific and Atlantic river systems. Its summit is not a well-defined crest, but is often rounded or flattened into a table-land. The direction of the great volcanic cones, which rise in an irregular line above it, is not identical with the main axis of the Sierra itself, except near the Mexican frontier, but has a more southerly trend, especially towards Salvador; here the base of many of the igneous peaks is cleft from foot to summit by ravines. It is, however, impossible to subdivide the Sierra Madre into as many great volcanic chains; for the volcanoes are isolated by stretches of comparatively low country; at least thirteen considerable streams flow down between them, from the main watershed of the sea to the coast. Viewed from the coast, the volcanic cones seem to rise directly from the central heights of the Sierra Madre, above which they tower; but in reality their bases are, as a rule, farther south. East of the Peninsula de Yucatan (Maya) the Pacific and Atlantic reach the continent by two passes. Monte Cristo, on the coast of October, is 6,976 ft. high; and, according to Professor Tappan, Carlquist, it was estimated at 13,976 ft. and 13,090 ft., and if the higher estimate be correct is the loftiest peak in Central America, the principal volcanic mass of the Yucatan Peninsula. Monte Cristo, however, is flanked by a series of peaks, of which at least 12,467 ft., which was in eruption during 1902, after centuries of quiescence, in which its slopes had been overgrown by dense forests; Atitlan (11,710), overlooking the lake of that name; Acatenango (13,007), the highest of the entire range of Central America; Fuego (i.e. "fire," variously estimated at 12,795 ft. and 12,582 ft.), which received its name from its activity at the time of the Spanish conquest; Agua (i.e. "water," 12,139 ft.), so named in 1541 because it destroyed the former capital of Guatemala with a deluge of water from its flooded crater; and Pacaya (8,930), a group of igneous peaks which were in eruption in 1870. (3) The so-called plateau which extends north of the Sierra Madre comprises the high valleys and lower basins of the Cordilleras. A better idea of this region is conveyed by the native name Altos, or highlands, although that term includes the northern part of the Sierra Madre. The mean elevation is greatest in the west (Altos of Santa Clara), and decreases eastward towards the Gulf of Guatemala. A few of the streams of the Pacific slope actually rise in the Altos, and force a way through the Sierra Madre at the highest point of the range, and descend to the sea by deep ravines with precipitous escarpments, to escape northwards towards the Atlantic. (4) The relief of the region of Soconusco is one of the most interesting and characteristic features of the upper border of the republic. Here the whole peninsula is formed by the Sierra de Merendon. (5) The highest point of Peten, which comprises about one-third of the whole area of Guatemala, belongs to the great Graphicos or Pre-Maya ranges, and is formed of level or undulating country, covered with grass or forest. Its population numbers less than two per sq. m., although many districts have a wonderfully fertile soil and abundance of water. The greater part of the country is cultivated, and the smaller part is used as pasture by the Indians, who form the majority of its inhabitants.

Guatemala is richly watered. On the western side of the sierras the versant is short, and the streams, while very numerous, are comparatively small and rapid. On the eastern side the basins of the rivers attain a very considerable development. The Motagua, whose principal head stream is called the Rio Grande, has a course of 90 m., and is navigable to within 90 m. of the capital, which is situated on one of its branches. The Suchiate forms a delta on the south of the Gulf of Honduras. Of similar importance is the Pochoich, which is about 180 m. in length, and passes about 20 m. from the coast. These rivers, as they are reaching the Golfo Amatique it passes through the Golfo Dulce, or Izbal Lake, and the Golfo Dulce. A vast number of streams, among which are the Chixoy, the Guaduaspe, and the Rio de la Plata, unite to form the Usambari, whose noble seacoast axis along the Mexican frontier, and flowing on through Chiapas and Tabasco, falls into the Bay of Campeche. The Chiapas follows a similar course.

There are several extensive lakes in Guatemala. The Lake of Peten or Laguna de Flores, in the centre of the department of Peten, is an irregular basin about 27 m. long, with an extreme breadth of 13 m. In an island in the western portion stands Flores, the Church of the Immaculate Conception of which is remarkable, and is situated in a great wood of cedars which have been recovered from its soil. On the shore of the lake is the stalactite cave of Jobintalan, of great local celebrity; but the primeval inhabitants of this region are said to have been the stone image of a horse that belonged to Cortes. The Golfo Dulce is, as its name implies, a fresh-water lake, although so near the Atlantic. It is about 36 m. long, and would be of considerable value as a harbour if the bar at the mouth of the Rio Dulce did not prevent the upward passage of seafaring vessels. As a contrast the Lake of Atitlan (q.v.) is a land-locked basin enriched with lofty mountains. About 9 m. S. of the capital lies the Lake of Amatitlan (q.v.) with the town of the same name. On the borders of Salvador and Guatemala there is the Lake of Guia, about 20 m. long and 12 broad, at a height of 2100 ft. above the sea. It is backed by Olancho, a town in which stands the Ibárrara, which lies about 1000 ft. higher at the foot of the Sierra Madre.

The geology, fauna and flora of Guatemala are discussed under Central America. The bird-life of the country is remarkably abundant. Among the most remarkable is the quail or quiscal (Tropon resplendens), has been chosen as the national emblem.

Climate.—The climate is healthy, except on the coasts, where malaria is prevalent. The rainy season in the interior lasts from May to October, and in the last quarter of the year, December. The coldest month is January, and the warmest is May. The average temperatures for these months at places of different altitude are: at Mayan City, 62° 7; at the observatory of Karl Sapper, shown on the following page. The average rainfall is considerable, and varies with the position, where the prevailing winds are charged with moisture from the Gulf of Mexico or the Caribbean Sea; at Tual, a high station on the Pacific, it is 130. It is a very wet climate, and there are 27 in. towards the Atlantic rain often occurs in the dry season, and there is a local saying near the Golfo Dulce that "it rains thirteen months in the year." Fogs are not rare. In Guatemala,
as in other parts of Central America (p.e.), each of the three climatic zones, cold, temperate and hot (tierra fría, tierra templada, tierra caliente) has its special characteristics, and it is not easy to generalize about the climate of the country as a whole.

Natural Resources. The minerals discovered in Guatemala include gold, silver, lead, tin, copper, mercury, antimony, coal, salt and sulphur; but it is uncertain if many of these exist in quantities sufficient to repay exploitation. Gold is obtained at Las Quebradas and La Izabal, silver in the department of Santa Rosa and Chinantla, and salt in those of Santa Rosa and Alta Vera Paz. During the 17th century gold-washing was carried on by English miners in the Motagua valley, but it is said to have yielded rich profits; hence the name of “Gold Coast” was not infrequently given to the Atlantic littoral near the mouth of the Motagua.

The area of forest has only been seriously diminished in the west, and amounted to 2050 sq. m. in 1904. Besides rubber, yields many valuable dye-woods and cabinet-woods, such as cedar, mahogany and logwood. Fruits, grain and medicinal plants are obtained in great abundance, especially where the soil is large of volcanic origin, as in the Alto Peten and Sierra More. Part of the Peten district are equally fertile, maize in this region yielding two hundredfold from unmanured soil. The vegetable products of Guatemala include coffee, cocoa, cacao-nut, bananas, oranges, vanilla, aloes, agave, ipecacuanha, castor-oil, sarsaparilla, cinchona, tobacco, indigo and the woody plant (Myrica cerifera).

Inhabitants.—The inhabitants of Guatemala, who tend to increase rapidly owing to the high birth-rate, low mortality, and low rate of emigration, numbered in 1903 1,842,134, or more than one-third of the entire population of Central America. Fully 66% are pure Indians, and the remainder, classed as Ladinos or “Latinos” (i.e. Spaniards in speech and mode of life), comprise a large majority of half-castes (mestizos) and civilized Indians. The Ladinos include coffee, cacao-nut, banana, oranges, vanilla, aloes, agave, ipecacuanha, castor-oil, sarsaparilla, cinchona, tobacco, indigo and the woody plant (Myrica cerifera).

Inhabitants.—The inhabitants of Guatemala, who tend to increase rapidly owing to the high birth-rate, low mortality, and low rate of emigration, numbered in 1903 1,842,134, or more than one-third of the entire population of Central America. Fully 66% are pure Indians, and the remainder, classed as Ladinos or “Latinos” (i.e. Spaniards in speech and mode of life), comprise a large majority of half-castes (mestizos) and civilized Indians. The Ladinos include coffee, cacao-nut, banana, oranges, vanilla, aloes, agave, ipecacuanha, castor-oil, sarsaparilla, cinchona, tobacco, indigo and the woody plant (Myrica cerifera).

No part of Central America contains a greater diversity of tribes, and in 1883 Otto Stoll estimated the number of spoken languages as sixteen, although east of the meridian of Lake Atitlán the native speech has almost entirely disappeared and been replaced by Spanish. The Indians belong chiefly to the Maya stock, which predominates throughout Peten, or to the allied Quiché race which is well represented in the Altos and central districts. The Itzas, Mopans, Lacandonos, Chols, Pokonchi and the Pokomams who inhabit the large settlement of Mixco near the capital, all belong to the Maya family; but parts of central and eastern Guatemala are peopled by tribes distinct from the Mayas and not found in Mexico. In the 19th century the Mayas and Quiché, and also the Tzutujil and Chichime, attained a high level of civilization (see Central America, Archaeology), and at least two of the Guatemalan languages, Quiché and Cakchiquel, possess the rudiments or the relics of a literature. The Quiché Popol Vuh, or “Book of History,” which was translated into Spanish by the Dominican friar Ximenes, and edited with a French version by Brasseur de Bourbourg, is an important document for students of the local myths. In appearance the various Guatemalan tribes differ very little; in almost all the characteristic type of Indian is short but muscular, with low forehead, prominent cheek-bones and straight black hair. In character the Indians are, as a rule, peaceable, though conscious of their numerical superiority and at times driven to join in the revolutions which so often disturb the course of local politics; they are often intensely religious, but with a few exceptions are thrifty, industrious and inveterate gamblers. Their confidiae, or brotherhoods, each with its patron saint and male and female chiefs, exist largely to organize public festivals, and to purchase wooden masks, costumes and decorations for the dances and dramas in which the Indians delight. These dramas, which deal with religious and historical subjects, are of Indian origin, and somewhat resemble the mystery-plays of medieval Europe, a resemblance heightened by the introduction of Christian characters in the person of Christ and heroes such as Charlemagne. The Indians are devoted to bull-fighting and cock-fighting. Choral singing is a popular amusement, and is accompanied by the Spanish guitar and native wind-instruments. The Indians have a habit of consuming a yellowish edible earth containing sulphur; on pilgrimages they obtain images moulded of this earth at the shrines they visit, and eat the images as a prophylactic against disease. Maize, beans and bananas, varied occasionally with dried meat and fresh pork, form their staple diet; drunkenness is common on pay-days and festivals, when large quantities of a fiery brandy called chicha are consumed.

Chief Towns.—The capital of the republic, Guatemala or Guatemala la Nueva (pop. 205,000), is built on the site of the cities of Quezaltenango (17,000), Escuintla (12,000), Huehuetenango (12,000), Amatitlán (10,000) and Atitlán (9,000) are described under separate headings. All are important agricultural and cattle-trading centers. Las Petes are situated on a mountainous region where the climate is temperate. Retalhuleu, among the southern foothills of the Sierra Madre, is one of the centres of coffee production, and is connected by railway with the Pacific via Chichina, where it lies in the place in the wet season. Both Retalhuleu and Champerico were, like Quezaltenango, Sololá, and other towns, temporarily ruined by the earthquake of the 28th of April 1902. Santa Cruz Quiché, 25 m. N.E. of Totonicapán, was formerly the capital of the Quiché kings, but has now a Ladino population. Livingston, a seaport at the mouth of the Polochic (here called the Rio Dulce), was founded in 1806, and subsequently named after the author of a code of Guatemalan laws; few vestiges remain of the Spanish settlement of Sevilla la Nueva, founded in 1844, and of the English colony of Abbotsville, founded in 1845, both near the mouth of the Rio Lempa. Livingston, now called by its Indian name of Sacul, is the principal town of Peten.

Shipping and Communications.—The Republic is in regular steam communication on the Atlantic side with New Orleans, New York and Hamburg, by vessels which visit the ports of Barrios (Santa Tomas) and Livingston. On the southern side the ports of San José, Champerico and Ocós are visited by the Pacific mail steamers, by the vessels of a Hamburg company and by those of the South American Navigation Companies. Ixtapa, formerly the principal harbour on the south coast, has been almost entirely abandoned since 1853. Guanán, on the Motagua, and San Blas, on the mouth of the Suchiate, are small river ports, and the towns are connected by wagon roads, towards the construction and maintenance of which each male inhabitant is required to pay two pesos or give four days' work a year. There are coach routes between all the chief towns and points of interest in the country and by the country transport is still on mule-back. All the railway lines have been built since 1875. The main lines are the Southern, from the Pacific to Santa Cruz Quiché, 25 m. N.E. of Totonicapán, to the capital; the Northern, a government line from the capital to Puerto Barrios, which completes the interoceanic railroad; and the Western, from Champerico to Quezaltenango, belonging to a Guatemalan company, but largely under German management. For local traffic there are several lines; one from Ixtapa, near San José, to Naranjo, and another from Ocós to the western coffee plantations. On the Atlantic slope there are steamers from Guatemala to the Rio Dulce and other lakes, and the Polochic river as far as Panzos. The narrow-gauge railroad which serves the Guatemalan plantations in the Vera Paz region is largely owned by Germans.

Guatemala joined the Postal Union in 1881; but its postal and telegraphic services have suffered greatly from financial difficulties. The telegraphic systems of Guatemala la Nueva, Quezaltenango and other cities are owned by private companies.

Commerce and Industry.—The natural resources of Guatemala are rich but undeveloped; and the capital necessary for their exploitation is not available. In the past the high ratio of population to the land, and the relative stability of the country, have been the mainspring of prosperity, and the expansion of trade and industry has been largely due to the demand of gold (the primary product of the country) and the demand for coffee (obtained in large quantities from the hills). This industry has been ruined by the competition of dye chemists, and a substitute was found in the cultivation of coffee.
Guatemala

Guatemala is surpassed only by Brazil and the East Indies in the quantity of coffee it exports. The cultivated area is now more than one-half of the crop is sent to Germany, while three-fifths of the remainder go to the United States and one-fifth to Great Britain. The average yearly product is about 70,000,000 quintals, valued at $70,000,000 in 1922. At a prime cost of 0.80 centavos per pound, the 1922 crop was worth about $30,000,000. Coffee is grown in the valleys of the departments of Huehuetenango, Guatemala and Peten, and on the plateaus of El Progreso, Alta Verapaz, and San Marcos. The coffee area is about 500,000 acres, 80 percent of which is irrigated.

Sugar, bananas, tobacco and cocoa are cultivated; but much of the sugar and bananas, most of the cocoa, and many of the coffee trees, are owned by the foreign-owned companies. The sugar output is about 200,000 tons per year, valued at $25,000,000. Bananas are grown on about 100,000 acres, and the output is about 3,000,000 tons per year, valued at $3,000,000. Tobacco is grown on about 25,000 acres, and the output is about 15,000,000 pounds per year, valued at $1,500,000.

The principal industrial products are textiles, cotton, and sugar. The textile industry is concentrated in the departments of Guatemala, Chiquimula, and Izabal. The output of cotton is about 50,000,000 pounds per year, valued at $5,000,000. The output of sugar is about 75,000,000 pounds per year, valued at $7,500,000.

Gold and silver are the most important mineral products. The output of gold is about 10,000 ounces per year, valued at $200,000. The output of silver is about 100,000 ounces per year, valued at $200,000.

The principal sources of foreign exchange are coffee, sugar, bananas, tobacco, and cocoa. The export trade is balanced by the import trade, and the balance of payments is about $2,000,000 per year.

The government is elected in a similar manner, but for 6 years, and he is theoretically not eligible for the following term. He is assisted by 6 ministers, heads of government departments, and by a council of state of 13 members, partly appointed by himself and partly by the national assembly.

Local Government.—Each of the twenty-two departments is administered by an official called a jefe politico, or political chief, appointed by the president, and each is subdivided into municipal districts. These districts are administered by one or more alcaldes or mayors, assisted by municipal councils, both alcaldes and councils being chosen by the people.

Justice.—The judicial power is vested in a supreme court, consisting of a chief justice and four associate justices elected by the Congress to 6-year terms; such justices are re-elected by the people; and twenty-six courts of first instance, each consisting of one judge appointed by the president and two by the chief justice of the supreme court.

Religion and Instruction.—The prevailing form of religion is the Roman Catholic, but the state recognizes no distinction of creed. The establishment of conventual or monastic institutions is prohibited. Of the population in 1893, 90% could neither read nor write, 2% could only read, and 8% could read and write.

Higher instruction is given in two national institutes at the capital, one for men with 500 pupils and one for women with 300. At Quezaltenango there are two similar institutes, and at Chiquimula there are two other. To each of the six there is a school for teachers attached, and within the republic there are four other schools for teachers. For professional instruction (law, medicine, engineering) there are schools supported by private funds, but aided occasionally by the government. Other educational establishments are a school of art, a national conservatory of music, a commercial college, four trades' schools with more than 600 pupils and a national library. There is a German school, endowed by the German government.

Defence.—For the white and mixed population military service is compulsory; from the eighteenth to the thirteenth year of age in the active army, and from the thirteenth to the fifteenth in the reserve. In 1922 the active army numbered 5,000, of which 3,000 were regulars and 2,000 were volunteers. The national guard is 56,000, of the reserve 29,400. About 7,000 officers and men are kept in regular service. Military training is given in all public and most private schools.

History.—Guatemala was conquered by the Spaniards under Pedro de Alvarado between 1522 and 1524. Up to the years 1837–1839 its history differs only in minor details from that of the neighbouring states of Central America (q.v.). The colonial period was marked by the destruction of the ancient Indian civilization, the extermination of many entire tribes, and the enslavement of the survivors, who were exploited to the utmost for the benefit of Spanish officials and adventurers. But although the administration was weak, corrupt and cruel, it succeeded in establishing the Roman Catholic religion, and in introducing the Spanish language among the Indians and Ladinos, who thus obtained a tincture of civilization and ultimately a desire for more liberal institutions. The Central American provinces revolted in 1821, were annexed to the Mexican empire of Iturbide from 1822 to 1823, and united to form a federal republic from 1823 to 1839. In Guatemala the Clerical, Conservative or anti-federal party was supported by the Catholic church, which opposed the Liberals or Federalists, and declared the country an independent republic, with Rafael Carrera (1814–1865) as president.

In 1845 an attempt to restore the federal union failed; in 1851 Carrera defeated the Federalist forces of Honduras and Salvador at La Arada near Chiquimula, and was recognized as the pacificator of the republic. In 1851 a new constitution was promulgated, and Carrera was appointed president till 1856, a dignity which was in 1854 bestowed upon him for life. His
rivalry with Gerardo Barrios (d. 1865), president of Salvador, resulted in open war in 1863. At Coatepeque the Guatemalans suffered a severe defeat, which was followed by a truce. Honduras now joined with Salvador, and Nicaragua and Costa Rica with Guatemala. The contest was finally settled in favour of Carrera, who besieged and occupied San Salvador and made himself dominant also in Honduras and Nicaragua. During the rest of his rule, which lasted till his death in April 1865, he continued to act in concert with the Clerical party, and endeavoured to maintain friendly relations with the European governments. Carrera's successor was General Cerna, who had been recommended by him for election. The Liberal party broadcast public ridicule of the act which they considered a violation of the constitution. The Junta of Five, however, was dissolved by a decree of February 1867, and Carrera's presidency was deposed. The archbishop of Guatemala and the Jesuits were driven into exile as intriguers in the interests of the Clericals. Pres. Ruino Barrios (1835-1855), elected in 1873, governed the country after the manner of a dictator; he expelled the Jesuits, confiscated their property and disestablished and disendowed the church. But though he encouraged education, promoted railway and other enterprises, and succeeded in settling difficulties as to the Mexican boundary, the general result of his policy was baneful. Conspiracies against him were rife, and in 1884 he was assassinated. His successor, President de la Guiga, an ex-vice-president, was also the restorer of the federal union of the Central American states, and when his efforts towards this end by peaceful means failed he had recourse to the sword. Counting on the support of Honduras and Salvador, he proclaimed himself, in February 1885, the supreme military chief of Central America, and claimed the command of all the forces within the five states. President Zaldivar, of Salvador, had been his friend, but after the issue of the decree of union he entered into a defensive alliance with Costa Rica and Nicaragua. In March Barrios invaded Salvador, and in the battle of April 1885 he was fought, in which the Guatemalan president was killed. He was succeeded by General Manuel Barillas. No further effort was made to force on the union, and on the 16th of April the war was formally ended. Peace, however, only provided opportunity for domestic conspiracy, with assassination and revolution in view. In 1892 General Jose Maria Reina Barrios was elected president; and in 1897 he was re-elected; but on the 8th of February 1898 he was assassinated. Severi Morales, vice-president, succeeded him; but in the same year Don Manuel Estrada Cabrera (b. 1857) was elected president for the term ending 1899. Cabrera proceeded with education, commerce and the improvement of communications, but his re-election for the term 1905-1911 caused widespread discontent. He was charged with aiming at a dictatorship, with permitting or even encouraging the imprisonment, torture and execution without trial of political opponents, with maladministration of the finances and with aggression against the neighbouring states. A well-armed force, which included a body of adventurers from San Francisco (U.S.A.) was organized by General Barillas, the ex-president, and invaded Guatemala in March 1906 from Mexico. British Honduras and Salvador, Barillas (1854-1907) proclaimed his intention of establishing a silver currency, and gained, to a great extent, the sympathy of the German and British residents; he had been the sole Guatemalan president who had not sought to prolong his own tenure of office. Ocampo was captured by his lieutenant, General Castillo, and the revolution speedily became a war, in which Honduras, Costa Rica and Salvador were openly involved against Guatemala, while Nicaragua was hostile. But Cabrera held his ground, and even gained several indecisive victories. The intervention of President Roosevelt and of President Diaz of Mexico brought about an armistice on the 19th of July, and the so-called "Marblehead Pact" was signed on the following day on board the United States cruiser "Marblehead." Its terms were embodied in a treaty signed (28th of September) by representatives of the four belligerent states, Nicaragua taking no part in the negotiations. The treaty included regulations for the improvement of commerce and navigation in the area affected by the war, and provided for the settlement of subsequent disputes by the arbitration of the United States and Mexico.

GUATEMALA, or GUATEMALA LA NUEVA (i.e., "New Guatemala," sometimes written Nueva Guatemala, and formerly Santiago de los Caballeros de Guatemala), the capital of the republic of Guatemala, and until 1821 of the Spanish captaincy-general of Guatemala, which comprised Chiapas in Mexico and all Central America except Panama. Pop. (1805) about 97,000. Guatemala is built more than 5000 ft. above sea-level, in a wide table-land traversed by the Rio de las Vacas, or Cow River, so called from the cattle introduced here by Spanish colonists in the 16th century. Deep ravines mark the edge of the table-land, and beyond it lofty mountains rise on every side, the highest peaks being on the south, where the volcanic summits of the Sierra Madre exceed 12,000 ft. Guatemala has a station on the transcontinental railway from Puerto Barrios on the Atlantic (100 m. N.E.) to San Jose on the Pacific (75 m. S. by W.). It is thrice the size of any other city in the republic, and has a corresponding commercial superiority. Its archbishop is the primate of Central America (excluding Panama). Like most Spanish-American towns Guatemala is laid out in wide and regular streets, often planted with avenues of trees, and it has extensive suburbs. The houses, though usually of only one storey, are arranged on considerable heights and are surrounded by large gardens and courts. Among the open spaces the chief are the Plaza Mayor, which contains the cathedral, erected in 1730, the archiepiscopal palace, the government buildings, the mint and other public offices; and the more modern Reforma Park and Plaza de la Concordia, now the favourite resorts of the inhabitants. There are many large schools for both sexes, besides hospitals and an orphanage. Many of the principal buildings, such as the military academy, were originally convents. The theatre, founded in 1856, is one of the best in Central America. A museum, founded in 1821, is maintained by the Sociedad Economica, which in various ways has done great service to the city and the country. There are two fortresses, the Castillo Matamoros, built by Rafael Carrera (see GUATEMALA [republic under History]), and the Castillo de San Jose. Water is brought from a distance of about 8 m. by two old aqueducts from the towns of Mixco and Pinula; fuel and provisions are largely supplied by the Pokomam Indians of Mixco. The general prosperity, and to some extent the appearance of Guatemala, have procured for it the name of "the Path of Central America." It is lighted by electricity and has a good telephone service. Its trade is chiefly in coffee, but it also possesses cigar factories, wool and cotton factories, breweries, tanneries and other industrial establishments. The foreign trade is chiefly controlled by Germans.

The first city named Guatemala, now called Ciudad Vieja or "Old City," was founded in 1527 by Pedro de Alvarado, the conqueror of the country, on the banks of the Rio Pensativo, and at the foot of the volcano of Agua (i.e., "Water"). In 1541 it was overwhelmed by a deluge of water from the flooded
GUATOS—GUAYAQUIL

GUATOS, a tribe of American Indians of Costa Rica. They are an active, hardy people, who have always maintained hostility towards the Spaniards and retain their independence. From their language they appear to be a distinct stock. They were described by old writers as being very fair, with flaxen hair, and these reports led to a belief, since exploded, that they were European hybrids. There are very few surviving.

GUAYAQUIL, or SANTIAGO DE GUAYAQUIL, a city and port of Ecuador, capital of the province of Guayas, on the right bank of the Guayas river, 33 m. above its entrance into the Gulf of Guayaquil, in 2° 12' S., 79° 51' W. Pop. (1890) 44,772; (1897, estimate) 51,000, mostly half-breeds. The city is built on a comparatively level pacional or savanna, extending southward from the base of three low hills, called Los Cerros de la Cruz, between the river and the partially filled waters of the Estero Salado. It is about 30 ft. above sea-level, and the lower parts of the town are partially flooded in the rainy season. The old town is the upper or northern part, and is inhabited by the poorer classes, its streets being badly paved, crooked, undrained, dirty and pestilential. The great fire of 1896 destroyed a large part of the old town, and some of its insanitary conditions were improved in rebuilding. The new town, or southern part, is the business and residential quarter of the better classes, but the buildings are chiefly of wood and the streets are provided with surface drainage only. Among the public buildings are the governor's and bishop's palaces, town-hall, cathedral and 9 churches, national college, episcopal seminary and schools of law and medicine, theatre, two hospitals, custom-house, and several asylums and charitable institutions. Guayaquil is also the seat of a university corporation with faculties of law and medicine. A peculiarity of Guayaquil is that the upper floors in the business streets project over the walks, forming covered arcades. The year is divided into a wet and dry season, the former from January to June, when the hot days are followed by nights of drenching rain. The mean annual temperature is about 83° to 85° F.; malarial and bilious fevers are common, the latter being known as "Guayaquil fever," and epidemics of yellow fever are frequent. The dry or summer season is considered pleasant and healthy. The water-supply is now brought in through iron mains from the Cordilleras 53 m. distant. The mains pass under the Guayas river and discharge into a large distributing reservoir on one of the hills N. of the city. The city is provided with tramway and telephone services, the streets are lighted with gas and electricity, and telegraph communication with the outside world is maintained by means of the West Coast cable, which lands at the small port of Santa Elena, on the Pacific coast, about 65 m. W. of Guayaquil. Railway connexion with Quito (290 m.) was established in June 1908. There is also steamboot connexion with the producing districts of the province on the Guayas river and its tributaries, on which boats run regularly as far up as Bodegas (80 m.) in the dry season, and for a distance of 40 m. on the Daule. For smaller boats there are about 200 m. of navigation on this system of rivers. The exports of the province are almost wholly transported on these rivers, and are shipped either at Guayaquil, or at Puna, its deep-water port, 63 m. outside the Guayas bar, on the E. end of Panama Island. The Guayas river is navigable up to Guayaquil for steamers drawing 22 ft. of water; larger vessels anchor at Puna, 40 m. from Guayaquil, where cargoes and passengers are transferred to lighters and tenders. There is a quay on the river front, but the depth alongside does not exceed 18 ft. The principal exports are cacao, rubber, coffee, tobacco, hides, cotton, Panama hats, cinchona bark and ivory nuts, the value of all exports for the year 1905 being 1,414,687 $ and 5,674,688 $ for the whole republic. In 1908 the exports were: cacao, valued at $273,000; rubber, valued at $350,000; coffee, valued at $273,000; and vegetable ivory, valued at $102,000.
There are some small industries in the city, including a shipyard, saw-mills, foundry, sugar refineries, cotton and woolen mills, brewery, and manufactures of soap, cigars, chocolate, ice, soda-water and liqueurs.

Santiago de Guayaquil was founded on St James's day, the 25th of July 1535, by Sebastian de Benalcázar, but was twice abandoned before its permanent settlement in 1537 by Francesco de Orellana. It was captured and sacked several times in the 17th and 18th centuries by pirates and freebooters—by Jacob Clark in 1624, by French pirates in 1686, by English freebooters under Edward David in 1687, by William Dampier in 1707 and by Clapperton in 1709. Defensive works were erected in 1730, and in 1763, when the town was made a governor's residence, a castle and other fortifications were constructed. Owing to the flimsy construction of its buildings Guayaquil has been repeatedly burned, the greater fires occurring in 1707, 1704, 1865, 1896 and 1899. The city was made the see of a bishopric in 1572.

**GUAYAS, or EL GUAYAS, a coast province of Ecuador, bounded N. by Manabi and Pichincha, E. by Los Ríos, Carchi and Azuay, S. by El Oro and the Gulf of Guayaquil, and W. by the same gulf, the Pacific Ocean and the province of Manabí. Pop. (1893, estimate) 98,100; area, 11,504 sq. m. It is very irregular in form and comprises the lower alluvial districts surrounding the Gulf of Guayaquil between the Western Cordilleras and the coast. It includes (since 1865) the Galápagos Islands, lying 600 m. off the coast. The province of Guayas is heavily forested and traversed by numerous rivers, for the most part tributaries of the Guayas river, which enters the gulf from the N. This river system has a drainage area of about 14,000 sq. m. and an aggregate of 200 m. of navigable channels in the rainy season. Its principal tributaries are the Daule and Baborayo or Chimbo (also called Bodega), and of the latter the Vinces and Yaguachi. The climate is hot, humid and unhealthy, bilious and malarial fevers being prevalent. The rainfall is abundant and the soil is deep and fertile. Agriculture and the collection of forest products are the chief industries. The staple products are cacao, coffee, sugar-cane, cotton, tobacco and rice. The cultivation of cacao is the principal industry, the exports forming about one-third the world's supply. Stock-raising is also carried on to a limited extent. Among forest products are rubber, cinchona bark, toquilla fibre and ivory nuts. The manufacture of so-called Panama hats from the fibre of the toquilla palm (commonly called *pajita*, after a town in Manabí famous for this industry) is a long-established domestic industry among the natives of this and other coast provinces, the humidity of the climate greatly facilitating the work of plaiting the delicate straw, which would be broken in a dry atmosphere. Guayas is the chief industrial province of the republic, and about nineteen-twentieths of the commerce of Ecuador passing through the port of its capital, Guayaquil. There are no land transport routes in the province except the Quito & Guayaquil railway, which traverses its eastern half. The sluggish river channels which intersect the greater part of its territory afford excellent facilities for transporting produce, and a large number of small boats are regularly engaged in that traffic. There are no large towns in Guayas other than Guayaquil. Durán, on the Guayas river opposite Guayaquil, is the starting point of the Quito railway and contains the shops and offices of that line. The port of Santa Elena on a bay of the same name, about 65 m. W. of Guayaquil, is a landing-point of the West Coast cable, and a port of call for some of the regular steamship lines. Its exports are chiefly Panama hats and salt.

**GUAYCURUS, a tribe of South American Indians on the Paraguay. The name has been used generally of all the mounted Indians of Gran Chaco. The Guaycurus are a wild, fierce people, who paint their bodies and go naked. They are fearless horsemen and are occupied chiefly in cattle rearing.

**GUAYMAS, or San José de Guaymas, a seaport of Mexico, in the state of Sonora, on a small bay opening into the Gulf of California a few miles W. of the mouth of the Yaqui river, in lat. 27° 58' N., long. 110° 58' W. Pop. (1900) 864. The harbour is one of the best on the W. coast of Mexico, and the port is a principal outlet for the products of the large state of Sonora. The town stands on a small, arid plain, nearly shut in by mountains, and has a very hot, dry climate. It is connected with the railways of the United States by a branch of the Southern Pacific from Benson, Arizona, and is 390 m. S. by W. of the frontier town of Nogales, where that line enters Mexico. The climate, and the gold, silver, precious metals, and other minerals found on the ranches around the town, have been of great importance to the town, and it is said that deposits of gold and silver are of great extent, and contain from 8 to 15 per cent. of gold.

**GUUBUSUI (anc. Iguvium; med. Eugubium), a town and episcopal see of Umbria, Italy, in the province of Perugia, from which it is 23 m. N.N.E. by road; by rail it is 13 m. N.W. of Fossato di Vico (on the line between Foligno and Ancona) and 70 m. E.S.E. of Arezzo. Pop. (1901) 5783 (town); 26,718 (commune). Guubbio is situated at the foot and on the steep slopes of Monte Calvo, from 1508 to 1735 ft. above sea-level, at the entrance to the gorge which ascends to Scheggia, probably on the site of the ancient Umbrian town. It presents a markedly medieval appearance. The most prominent building is the Palazzo del Consoli, on the N. side of the Piazza della Signoria; it is a huge Gothic edifice with a tower, erected in 1332-1346, according to tradition, by Matteo di Giovanni of Guubbio; the name of Angelo da Orvieto occurs on the arch of the main door, but his work may be limited to the sculptures of this arch. It has two stories above the ground floor, and, being on the slope of the hill, is, like the whole piazza, raised on arched substructures. On the S. side of the piazza is the Palazzo Pretorio, or della Podestà, begun in 1349 and now the municipal palace. It contains the famous *Tabulae Iguvinae*, and a collection of paintings of the Umbrian school, of furniture and majolica. On the E. side is the modern Palazzo Ranghi-Bescancone, which until 1882 contained fine collections, now dispersed. Above the Piazza della Signoria, at the highest point of the town, is the Palazzo Ducale, erected by the dukes of Urbino in 1474-1480; the architect was, in all probability, Lucio da Laurana, to whom is due the palace at Urbino, which this palace resembles, especially in its fine colonnaded court. The Palazzo Beni, lower down, belongs to a somewhat earlier period of the 15th century. Pope Martin V. lodged here for a few days in 1420. The Palazzo Accoramboni, on the other hand, is a Renaissance structure, with a fine entrance arch. Here Vittoria Accoramboni was born in 1557. Opposite the Palazzo Ducale is the cathedral, dedicated to SS. Mariano e Jacopo, a structure of the 12th century, with a façade, adorned with contemporary sculptures, partly restored in 1514-1550. The interior contains some good pictures by Umbrian artists, a fine episcopal throne in carved wood, and a fine Flemish cope given by Pope Marcellus II. (1553) in the sacristy. The exterior of the Gothic church of S. Francesco, in the lower part of the town, built in 1550, preserves its original style, but the interior has been modernized; and the same fate has overtaken the Gothic churches of S. Maria Nuova and S. Pietro. S. Agostino, on the other hand, has its Gothic interior better preserved. The whole town is full of specimens of medieval architecture, the pointed arch of the 13th century being especially prevalent. A remarkable procession takes place in Guubbio on the 15th of May in each year, in honour of S. Ubaldo, when three colossal wooden pedestals, each over 30 ft. high, and crowned by statues of SS. Ubaldo, Antonio and Giorgio, are carried through the town, and then, in a wild race, up to the church of S. Ubaldo on the mountain-side (2690 ft.). See H. M. Bower, *The Elevation and Procession of the Ceri at Guubbio* (Folk-lore Society, London, 1897).

After its reconstruction with the help of Narses (see Iguvium) the town remained subject to the exarchs of Ravenna, and, after the destruction of the Lombard kingdom in 774, formed part of the donation of Charlemagne to the pope. In the 11th century the beginnings of its independence may be traced. In the struggles of that time it was generally on the Ghibelline side. In 1115 it repelled an attack of several neighbouring cities, and formed from this time a republic, governed by consuls. In 1155 it was besieged by the emperor Frederick I., but saved by the intervention of its bishop, S. Ubaldo, and was granted privileges
GUBEN—GUDGEON 667

by the emperor. In 1263 it had its first podestà, and from this period dates the rise of its importance. In 1387, after various political changes, it surrendered to Antonio da Montefeltro of Urbino, and remained under the dominion of the dukes of Urbino until, in 1624, the whole duchy was ceded to the pope.

Gubbio was the birthplace of Oderisio, a famous miniature painter (1240–1299), mentioned by Dante as the honour of his native town (Purg. xi. 80 "l’ onor d’Agobbio"), but no authentic works by him exist. In the 13th and 14th centuries a branch of the Umbrian school of painting flourishing here, the most famous masters of which were Guido Palmerucci (1380–1435) and several members of the Nelli family, particularly Ottaviano (d. 1442), whose best work is the "Madonna del Belvedere" in St. Maria Nuova at Gubbio (1404), extremely well preserved, with bright colouring and fine details. Another work by him is the group of frescoes including a large "Last Judgment," and scenes from the life of St. Augustine, in the church of S. Agostino, discovered in 1902 under a coating of whitewash. These painters seem to have been influenced by the contemporary masters of the Siennese school.

Gubbio occupies a far more important place in the history of majolica. In a decree of 1438 a vasarius vasorum pictorum is mentioned, a painter, who probably was not the first of his kind. It was brought to perfection by Giorgetto Andreoli, whose father had emigrated hither from Pavia, and who in 1458 became a citizen of Gubbio. The works by his hand are remarkable for their ruby tint, with a beautiful metallic lustre; but only one small tazza remains in Gubbio itself. His art was carried on by his sons, Cencio and Ubaldus, but was afterwards lost, and only recovered in 1853 by Angelo Fabbi and Luigi Carocci.

Two miles outside Porta Metauro to the N.E. is the Bottaccone, a large water reservoir, constructed in the 13th or 14th century; the water is collected in the bed of a stream by a dam.

See A. Colasanti, Gubbio (Bergamo, 1905); L. McCracken, Gubbio (London, 1905).

GUBEN, a town of Germany, in the kingdom of Prussia, at the confluence of the Lubis with the Neisse, 28 m. S.S.E. of Frankfort-on-Oder, at the junction of railways to Breslau, Halle and Forst. Pop. (1875) 33,704; (1905) 36,666. It possesses three Evangelical churches, a Roman Catholic church, a synagogue, a gymnasium, a modern school, a museum and a theatre. The principal industries are the spinning and weaving of wool, the manufacture of pottery, hats, cloth, paper and machinery. The vine is cultivated in the neighbourhood to some extent, and there is also some trade in fruit and vegetables. Guben is of Wendish origin. It is mentioned in 1207 and received civic rights in 1235. It was surrounded by walls in 1311; about which time it came into the possession of the margrave of Brandenburg, from whom it passed to Bohemia in 1368. It was twice devastated by the Hussites, and in 1631 and 1642 it was occupied by the Swedes. By the peace of Prague in 1655 it came into the possession of the elector of Saxony, and in 1815 it was, with the rest of Lower Lusatia, united to Prussia.

GUBERNATIS, ANGELO DE, COUNT (1840—), Italian man of letters, was born at Turin and educated there and at Berlin, where he studied philology. In 1862 he was appointed professor of Sanskrit at Florence, but having married a cousin of the Socialist Bakunin and become interested in his views he resigned his appointment and spent some years in travel. He was reappointed, however, in 1867; and in 1891 he was transferred to the university of Rome. He became prominent both as an orator and a writer, and in 1867 published the Italia letteraria (1863), the Rivista orientale (1867), the Civiltà italiana and Rivista europea (1866), the Bollettino italiano degli studi orientali (1876) and the Rivista internazionale (1883), and in 1887 became director of the Giornale della società asiatica. In 1878 he started the Dizionario biografico degli scrittori contemporanei. His Oriental and mythological works include the Piccola enciclopedia indiana (1867), the Fonti vediche (1868), a famous work on zoological mythology (1872), and another on plant mythology (1876). He also edited the encyclopaedic Storia universale della letteratura (1873–1883). His work in verse includes the dramas Cato, Romolo, Il re Nala, Don Rodrigo, Savitri, &c.

GUDBRANDSDAL, a district in the midlands of southern Norway, comprising the upper course of the river Lougen or Laagen from Lillehammer at the head of Lake Mjøsøen to its source in Lake Lesjøkogen and tributary valleys. Lillehammer, the centre of a rich timber district, is 114 m. N. of Christiania by rail. The railway continues through the well-wooded and cultivated valley to Otta (70 m.). Several tracks run westward into the wild district of the Jotunheim. From Otto good driving is required, but the roads descend to and cross the western slope, where the scenery is incomparably finer than in Gudbrandsdal itself—(a) past Sørurn, with the 13th-century churches of Vaagen and Lom (a fine specimen of the Stavekirke or timber-built church), Aanstad and Polfoss, with beautiful falls of the Otta river, to Grotli, whence roads diverge to Stryn on the Nordfjord, and to Marok on the Geirangerfjord; (b) past Domaas (with branch road north to Stören near Trondhjem, skirting the Dovrefjeld), over the watershed formed by Lesjøkogen Lake, which drains in both directions, and down through the important railway route to the E. and onwards to Oslo.

GUDÉ (Gudus), MARQUARD (1635–1689), German archaeologist and classical scholar, was born at Rendsburg in Holstein on the 1st of February 1635. He was originally intended for the law, but from an early age showed a decided preference for classical studies. In 1658 he went to Holland in the hope of finding work as a teacher of classics, and in the following year, through the influence of J. F. Gronovius, he obtained the post of tutor and travelling companion to a wealthy young Dutchman, Samuel Schars. During his travels Gude seized the opportunity of copying inscriptions and MSS. At the earnest request of his pupil, who had become greatly attached to him, Gude refused more than one professional appointment, and it was not until 1671 that he accepted the post of librarian to Duke Christian Albert of Holstein-Gottorp. Schars, who had accompanied Gude, died in 1675, and left him the greater part of his property. In 1678 Gude, having quarrelled with the duke, retired into private life; but in 1682 he entered the service of Christian V. of Denmark as counsellor of the Schleswig-Holstein chanceller, and remained in it almost to the time of his death on the 26th of April 1689. Gude's great life-work, the collection of Greek and Latin inscriptions, was not published until 1711. Mention may also be made of his editio princeps (1661) of the treatise of Hippolytus the Martyr on Antichrist, and of his notes on Phaedrus (with four new tables discovered by him) published in P. Burmann's edition (1698).

His correspondence (ed. P. Burmann, 1697) is the most important authority for the events of Gude's life, besides containing valuable information on the learning of the times. See also J. Moller, Cimbria litar, III., and C. Bursian in Allgemeine deutsche Biographie, x.

GUDEMAN, ALFRED (1862—94), American classical scholar, was born in Atlanta, Georgia, on the 26th of August 1862. He graduated at Columbia University in 1883 and studied under Hermann Diels at the University of Berlin. From 1890 to 1893 he was reader in classical philology at Johns Hopkins University, from 1893 to 1902 professor in the University of Pennsylvania, and from 1902 to 1904 professor in Cornell University. In 1904 he became a member of the corps of scholars preparing the Wofflin Thesaurus linguae Latinae—a unique distinction for an American Latinist, as was the publication of his critical edition, with German commentary, of Tacitus' Agricola in 1902 by the Weimannsche Buchhandlung of Berlin. He wrote The Literature of the Empire (2 vols., Prose and Poetry, 1898–1899), a History of Classical Philology (1902) and Sources of Plutarch's Life of Cicero (1902); and edited Tacitus' Dialogus de oratoribus (text with commentary, 1894 and 1898) and Agricola (1899; with Germania, 1900), and Sallust's Catiline (1903).

GUDGEON (Gobio fluviatilis), a small fish of the Cyprinid family. It is nearly related to the barbel, and has a small barbel or fleshy appendage at each corner of the mouth. It is the
GULDUR—GUELPHS AND GIBELLINES

GUBIONE OF ITALY, GUBION OF FRANCE (whence adapted in M. English as goffin), and Grützing or Gründling in German, Gudhins or Gudhins, a Middle High German epic written in the sixteenth century. It is an heroic epic, resembling the Iliad except that the bottom, and seldom exceeding 8 in. in length. In China and Japan there are variations differing only slightly from the common European type.

GUDRUN (KUDRUN), a Middle High German epic, written probably in the early years of the 13th century, not long after the Nibelungenlied, the influence of which may be traced upon it. It is preserved in a single MS. which was prepared at the command of Maximilian I., and was discovered as late as 1820 in the Castle of Ambras in Tirol. The author was an unnamed Austrian poet, but the stemma palaeographia of the whole saga, which also belongs to the cycle of sagas, which, like those of the Nibelungenlied, falls into three easily distinguishable parts—those of the King of Ireland, the romance of Hettel, king of the Hegelingen, who woe and wins Hagen's daughter Hilde, and lastly, the more or less parallel story of how Herwig, king of Seeland, wins, in opposition to her father's wishes, Gudrun, the daughter of Hettel and Hilde. Gudrun is carried off by a king of Normandy, and her kinsfolk, who are in pursuit, are defeated in a great battle on the island of Wilpensand off the Dutch coast. The fair Gudrun is safe, and cannot be caught; so her husband, the Norman castle, refuses to become the wife of her captor, and is condemned to do the menial work of the household. Here, thirteen years later, Herwig and her brother Ortwin find her washing clothes by the sea; on the following day they attack the Norman castle with their army and carry out the long-delayed retribution.

The epic of Gudrun is not unworthy to stand beside the greater Nibelungenlied, and it has been aptly compared with it as the Odyssey to the Iliad. Like the Odyssey, Gudrun is an epic of the sea, and a study admirably turned round the conflict of human passions; nor is it built up round one all-absorbing, all-dominating idea like the Nibelungenlied. Scenery and incident are more varied, and the poet has an opportunity for a more lyric interpretation of motive and character. Gudrun is composed in stanzas similar to those of the Nibelungenlied, but with the essential difference that the last line of each stanza is identical with the others, and does not contain the extra accented syllable characteristic of the Nibelungen metre.

Gudrun was first edited by von der Hagen in vol. i. of his Heldenbuch (1820). Subsequent editions by A. Ziemann and A. J. Vollmer followed in 1837 and 1843. The best editions are those by von der Hagen (2nd ed., 1860), and especially by Kürschner's Deutsche Nationalliteratur (vol. 6, 1885), and by B. Symons (1885) and by E. Martin (2nd ed., 1901). H. Ettmüller first applied Lachmann's ballad-theory to the poem (1841), and K. Kriiger (1851) pointed out the enhekten Teile des Gedichts, 1853, but more than three-quarters of the whole as "not genuine." There are many translations of the epic into modern German, the best known being those of G. H. von Hagenroth in Tecnic (1883). A translation into English by M. P. Nichols appeared at Boston, U.S.A., in 1889.

Benedict, Die Gudrunssage in neuester literatur (1902.)

GUEBRIAN, JEAN BAPTISTE FAMIL, comte de (1643), marshal of France, was born at Plessis-Budes, near St. Brieuc, of an old Breton family. He served first in Holland, and in the Thirty Years' War he commanded from 1638 to 1639 the French contingent in the army of his friend Bernard of Saxe-Weimar, distinguishing himself particularly at the siege of Breslau in 1638. Upon the death of Bernard he received the command of his army, and tried, in conjunction with J. Baxer (1594–1641), the Swedish general, a bold attack upon Regensburg (1640). His victory at the battle of Wallendorf on the 29th of June 1641 and at Kempen in 1642 won for him the marshal's baton. Having failed in an attempt to invade Bavaria in concert with Torstenson he seized Rottweil, but was mortally wounded there on the 17th of November 1643.

A biography was published by Le Laboureur, Histoire du maréchal de Guebriant (1670). See A. Brinzing in Württembergische Vierteljahrschrift für Landesgeschichte (1902).

GUELER ROSE, so called from Guelphers, its supposed source, termed also marsh elder, rose elder, lesser elder (Ger. Wasserholder, Scheenbealt; Fr. teneur-obscur, l'obier d'Europe), known botanically as Viburnum Opulus, a shrub or small tree of the natural order Caprifoliaceae, a native of Britain, and widely distributed in the temperate and colder parts of Europe, Asia and North America. It is common in Ireland, but rare in Scotland. In height it is from 6 to 12 ft., and it thrives best in moist situations. The leaves are smooth, 2 to 3 in. broad, with 3 to 5 unequal serrate lobes, and glandular stipules adnate to the stalk. In autumn the leaves change their normal bright autumnal hue to gold. The flowers, which appear in June and July, are small, white, and carried in cyms to 10 in. in diameter. The outer blossoms in the wild plant have an enlarged corolla, ½ in. in diameter, and are devoid of stamens or pistils; in the common cultivated variety all the flowers are sterile and the inflorescence is globular, hence the term "snowball tree" applied to the plant, the appearance of which at the time of flowering has been prettily described by Cowper in his Winter Walk at Noon. The guelder rose bears juicy, red, elliptical berries, ½ in. long, which ripen in September, and contain each a hard seed. The inner parts of the plant are eaten, and in Siberia, after fermentation with flour, they are distilled for spirit. The plant has, however, emetic, purgative and narcotic properties; and Taylor (Med. Jurisp. i. 448, 2nd ed., 1873) has recorded an instance of the fatal poisoning of a child by the berries. Both they and the bark contain valerianic acid. The woody shoots of the guelder rose are manufactured into various small articles in Sweden and Russia. Another member of the genus, Viburnum, Lantana, wayfaring tree, is found in dry copses and hedges in England, except in the north.

GUELPH, a city of Ontario, Canada, 45 m. W. of Toronto, on the river Speed and the Grand Trunk and Canadian Pacific railways. Pop. (1901) 11,496. It is the centre of a fine agricultural district, and exports grain, fruit and live-stock in large quantities. It contains, in addition to the county and municipal buildings, the Ontario Agricultural College, which draws students from all parts of North and South America. The river affords abundant water-power for flour-mills, saw-mills, woollen-mills and numerous factories, of which agricultural implements, sewing machines and musical instruments are the chief.

GUELPHS AND TISTORS, through their doublets, doubtless, Italianized forms of the German words Welf and Waiblingen, although one tradition says that they are derived from Guelp and Gibel, two rival brothers of Pistoia. Another theory derives Gibelline from Gibello, a word used by the Sicilian Arabs to translate Hohenstaufen. However, a more popular story tells how, during a fight around Weinsberg in December 1140 between the German king Conrad III. and Welf, count of Bavaria, a member of the powerful family to which Henry the Lion, duke of Saxony and Bavaria, belonged, the soldiers of the latter raised the cry "He Welf!" to which the king's troops replied with "He Waiblingen!" this being the name of one of Conrad's castles. But the rivalry between Welf and Hohenstaufen, of which family Conrad was a member, was anterior to this event, and had been for some years a prominent fact in the history of Swabia and Bavaria, although its introduction into Italy—in a slightly modified form, however—only dates from the time of the Italian expeditions of the emperor Frederick I. It is about this time that the German chronicler, Otto of Freising, says, "Dune in Roma uno ad epud Gallase Germaniaeve fines famosae familiae actenus fuerunt, una Heinricorum de Guelbilinga, alia Guelforum de Alderfo, altera imperatores, altera magnos duces producere solita." Chosen German king in 1152, Frederick was not only the nephew and the heir of Conrad, he was related also to the Wels; yet, although his election abated to some extent the rivalry between Welf and Hohenstaufen in Germany, it opened upon it a larger and fiercer scale in Italy.

During the long and interesting period covered by Frederick's Italian campaigns, his enemies, prominent among whom were the cities of the Lombard League, became known as Wels, or Guelphs, while his partisans seized upon the rival term of
GUENEVERE

Waiblingen, or Ghibelline, and the contest between these two parties was carried on with a ferocity unknown even to the inhabitants of southern Germany. The distracted state of northern Europe, the dissensions between various pairs of towns, the savage hatred between family and family, were some of the causes which fed this feud, and it reached its height during the momentous struggle between Frederick II. and the Papacy in the 13th century. The story of the contest between Guelph and Ghibelline, however, is little less than the history of Italy in the middle ages. At the opening of the 13th century it was intensified by the fight for the German and imperial thrones between Philip, duke of Swabia, a son of Frederick I., and the Welf, Otto of Brunswick, afterwards the emperor Otto IV., a fight waged in Italy as well as in Germany. Then, as the heir of Philip of Swabia and the rival of Otto of Brunswick, Frederick II. was forced to throw himself into the arms of the Ghibellines, while his enemies, the popes, ranged themselves definitely among the Guelphs, and soon Guelph and Ghibelline became synonymous with supporter of pope and emperor.

After the death of Frederick II. in 1250 the Ghibelines looked for leadership to his son and successor, the German king, Conrad IV., and then to his natural son, Manfred, while the Guelphs called the French prince, Charles of Anjou, to their aid. But the Guelphs were more fortunate than the Ghibelines. The crown prince of Conrad, the last of the Hohenstaufen, in 1268, this great struggle began to lose force and interest. Guelph and Ghibelline were soon found representing local and family rather than papal and imperial interests; the names were taken with little or no regard for their original significance, and in the 15th century they began to die out of current politics. However, when Louis XII. of France conquered Milan at the beginning of the 16th century the old names were revived; the French king's supporters were called Guelphs and the friends of the emperor Maximilian I. were referred to as Ghibelines.

The feud of Guelph and Ghibelline penetrated within the walls of almost every city of northern Italy, and the contest between the parties, which practically makes the history of Florence during the 13th century, is specially noteworthy. First one side and then the other was driven into exile; the Guelph defeat at the battle of Monte Aperto in 1260 was followed by the expulsion of the Ghibelines by Charles of Anjou in 1266, and on a smaller scale a similar story may be told of many other cities (see Florence).

The Guelphs was buttsreed by an idea, yet very nebulous, of Italian patriotism. Dislike of the German and the foreigner rather than any strong affection for the Papacy was the feeling which bound the Guelph to the pope, and so enabled the latter to defy the arms of Frederick II. The Ghibelline cause, on the other hand, was aided by the dislike of the temporal power of the pope and the desire for a strong central authority. This made Dante a Ghibellite, but the hopes of this party, kindled anew by the journey of Henry VII. to Italy in 1310, were extinguished by his departure. J. A. Symonds thus describes the constituents of the two parties: "The Guelph party meant the burgurers of the consular Communes, the men of industry and commerce, the upholders of civil liberty, the friends of democratic expansion. The Ghibelline party included the naturalized nobles, the men of arms and illibleness, the advocates of feudalism, the politicians who regarded constitutional progress with disfavour. That the banner of the church floated over the one camp, while the standard of the empire rallied to itself the hostile party, was a matter of comparatively superficial moment." In another passage the same writer thus describes the sharp and universal division between Guelph and Ghibelline: "Ghibelines were the feathers in their cap upon one side, Guelphs upon the other. Ghibelines cut fruit at table crosswise, Guelphs straight down... Ghibelines drank out of smooth and Guelphs out of chased goblets. Ghibelines wore white and Guelphs red roses." It is interesting to note that while Dante was a Ghibellite, Petrarch was a Guelph.

GUENON (from the French, "one who grimaces, hence an ape"), the name applied by naturalists to the monkeys of the African genus Cercocebus, the Ethiopian representative of the Asiatic macaques, from which they differ by the absence of a posterior heel to the last molar in the lower jaw.

GUERET, a town of central France, capital of the department of Creuse, situated on a mountain declivity 48 m. N.E. of Limoges on the Orleans railway. Pop. (1896), town, 60,422; commune (including troops, &c.), 80,583. Apart from the Hôtel des Monney-roix (used as prefecture), a picturesque mansion of the 15th and 16th centuries, with mansard roof and multicolored tiles, Guéret has little architectural interest. It is the seat of a prefect and a court of assizes, and has a tribunal of first instance, a chamber of commerce and lycées and training colleges, for both sexes. The industries include brewing, saw-milling, leather-making and the manufacture of basket-work and wooden shoes, and there is trade in agricultural produce and cattle. Guéret grew up round an abbey founded in the 7th century, and in later times became the capital of the district of Marche.

GUEREZA, the native name of a long-tailed, black and white Abyssinian monkey, Colobus guereza (or C. abyssinicus), characterized by the white hairs forming a long pendent mantle. Other East African monkeys with a similar type of colouring, which, together with the wholly black west African C. satanas, collectively constitute the subgenus Guereza, may be included under the same title; and the name may be further extended to embrace all the African thumbless monkeys of the genus Colobus. These monkeys are the African representatives of the Indo-Malay langurs (Semnopithecus), with which they agree in their slender build, long limbs and tail, and complex stomachs, although differing by the rudimentary thumb. The members of the subgenus Guereza present a transition from a wholly black animal (C. satanas) to one (C. couadatus) in which the sides of the face are white, and the whole flanks, as well as the tail, clothed with a long fringe of pure white hairs.

GUERICKE, HEINRICH ERNST FERDINAND (1803—1878), German theologian, was born at Wettin in Saxony on the 25th of February 1803 and studied theology at Halle, where he was appointed professor in 1829. He greatly disliked the union between the Lutheran and the Reformed churches, which had been accomplished by the Prussian government in 1817, and in 1833 he definitely threw in his lot with the Old Lutherans. In 1835 he lost his professorship, but he regained it in 1840. Among his works was a Life of August Hermann Francke (1827, Eng. trans. 1837), Church History (1833, Eng. trans. by W. T. Shedd, New York, 1857—1863), Allgemeine christliche Symbolik (1839). In 1840 he helped to found the Zeitschrift für die gesammte lutherische Theologie und Kirche, and he died at Halle on the 4th of February 1878.

GUERICKE, OTTO VON (1602—1686), German experimental philosopher, was born at Magdeburg, in Prussian Saxony, on the 20th of November 1602. Having studied law at Leipzig, Helmstiid and Jena, and mathematics, especially geometry and mechanics, at Leiden, he visited France and England, and in 1636 became engineer-in-chief at Erfurt. In 1627 he was elected alderman of Magdeburg, and in 1646 mayor of that city and a magistrate of Brandenburg. His leisure was devoted to scientific pursuits, especially in pneumatics. Incited by the discoveries of Galileo, Pascal and Torricelli, he attempted the creation of a vacuum. He began by experimenting with a pump on water placed in a barrel, but found that when the water was drawn off the air permeated the wood. He then took a globe of copper fitted with pump and stopcock, and discovered that he could pump out air as well as water. Thus he became the inventor of the air-pump (1650). He illustrated his discovery before the emperor Ferdinand III. at the imperial diet which assembled at Regensburg in 1654, by the experiment of the "Magdeburg hemispheres." Taking two hollow hemispheres of copper, the edge of which fitted nicely together, he exhausted the air from between them by means of his pump, and it is recorded that thirty horses, fifteen back to back, were unable to pull them asunder until the air was readmitted. Besides investigating other phenomena connected with a vacuum, he constructed an electrical machine which depended on the excitation of a rotating ball of sulphur; and he made successful researches in astronomy, predicting the periodicity of the return of comets. In 1681 he gave up office, and retired to Hamborn, where he died on the 11th of May 1686.

His principal observations are given in his work, Experiments neuen physikischen, mathematischen, chemischen, und technischen Wissens, etc. (Amsterdam, 1672). He is also the author of a Geschichte der Belagerung und Eroberung von Magdeburg. See F. W. Hoffmann, Otto von Guericke (Magdeburg, 1878).

GUÉRIDON, a small table to hold a lamp or vase, supported by a tall column or a human or mythical figure. This piece of furniture, often very graceful and elegant, originated in France towards the middle of the 17th century. In the beginning the table was supported by a negro or other exotic figure, and there is some reason to believe that it took its name from the generic appellation of the young African grooms or "tiger," who was generally called "Guéridon," or as we should say in English "Sambô." The swarthy figure and brilliant costume of the fines, when represented openly or in groups, often produced a very striking effect, and when a small table was supported on the head by the upraised hands the idea of passive service was suggested with completeness. The guéridon is still occasionally seen in something approaching its original form; but it had no sooner been introduced than the artistic instinct of the French designer and artificer converted it into a far more object. By the death of Louis XIV. there were several hundreds of them at Versailles, and within a generation or two they had taken an infinity of forms—columns, tripod, termini and mythical figures. Some of the simpler and more artistic forms were of wood carved with familiar decorative motives and gilded. Silver, enamel, and indeed almost any material from which furniture can be made, have been used for their construction. A variety of small "occasional" tables are now called in French guéridons.

GUÉRIN, JEAN BAPTISTE PAULIN (1783—1855), French painter, was born at Toulon, on the 25th of March 1783, of poor parents. He learnt, as a lad, his father's trade of a locksmith, whilst at the same time he followed the classes of the free school of art. Having sold some copies to a local amateur, Guérin started for Paris, where he came under the notice of Vincent, whose counsels were of material service. In 1810 Guérin made his first appearance at the Salon with some portraits, which had a certain success. In 1812 he exhibited "Cain after the murder of Abel" (formerly in Luxembourg), and, on the return of the Bourbons, was much employed in works of restoration and decoration at Versailles. His "Dead Christ" (Cathedral, Baltimore) obtained a medal in 1817, and this success was followed up by a long series of works, of which the following are the most noteworthy: "Christ on the knees of the Virgin" (1810); "Anchises and Venus" (1822) (formerly in Luxembourg); "Ulysses and Minerva" (1834) (Musée de Rennes); "the Holy Family" (1820) (Cathedral, Toulon); and "Saint Catherine" (1838)(St. Roch). In his treatment of subject, Guérin attempted to realize roccoco graces of conception, the liveliness of which was lost in the strenuous effort to be correct. His chief successes were attained by portraits, and those of Charles Nodier and the Abbé Lamennais became widely popular. He died on the 19th of January 1855.

GUÉRIN, PIERRE NARCISSE, BARON (1774—1853), French painter, was born at Paris on the 13th of May 1774. Becoming a pupil of Jean Baptiste Regnault, he carried off one of the three "grands prix" offered in 1796, in consequence of the competition not having taken place since 1793. The pension was not indeed re-established, but Guérin fulfilled at Paris the conditions imposed upon a pensionnaire, and produced various works, one of which brought him prominently before the public. This work, "Marcus Sextus" (Louvre), exhibited at the Salon of 1799, excited wild enthusiasm, partly due to the subject,—a victim of Sulla's prosecution returning to Rome to find his wife dead and his house in mourning,—in which an illusion was found to the actual
GUÉRIN, MAURICE DE—GUERNSEY

671

situation of the émigrés. Guérin on this occasion was publicly crowned by the president of the Institute, and before his departure for Rome (on the re-establishment of the École under Suvée) a banquet was given to him by the most distinguished artists of Paris. In 1800, unable to remain in Rome on account of his health, he went to Naples, where he painted the "Grave of Amyntas." In 1802 Guérin produced "Phaëdra and Hippolytus" (Louvre); in 1810, after his return to Paris, he again achieved a great success with "Andromaque and Pyrrhus" (Louvre); and in the same year also exhibited "Céphalius and Aurora" (Collection Sommeriva) and "Bonaparte and the Relic of Cairo" (Versailles). The Restoration brought to Guérin the freedom of his art, from the first consul in 1803 the cross of the Legion of Honour, and in 1815 Louis XVIII named him Academician. The success of Guérin's "Hippolytus" of "Andromaque," of "Phaëdra" and of "Clytaenestra" (Louvre) had been ensured by the skilful selection of highly melodramatic situations, treated with the strained and pompous dignity proper to the art of the first empire; in "Aeneas relating to Dido the disasters of Troy" (Louvre), which appeared side by side with "Clytaenestra" at the Salon of 1817, the influence of the Restoration is plainly to be traced. In "The fall of Troy," which was exhibited publicly by the Académie de France, he tried to evoke those sensuous charms which he had previously rejected, and by the introduction of picturesque elements of interest. But with this work Guérin's public successes came to a close.

He was, indeed, commissioned to paint for the Madeleine a scene from the history of St. Louis, but his health prevented him from accomplishing what he had begun, and in 1822 he accepted the post of director of the École de Rome, which he in 1816 he had refused. On returning to Paris in 1828, Guérin, who had previously been made chevalier of the order of St. Michel, was ennobled. He now attempted to complete "Pyrrhus and Priam," a work which he had begun at Rome, but in vain; his health had finally broken down, and in the hope of improvement he returned to Italy with Horace Vernet. Shortly after his arrival at Rome Baron Guérin died, on the 6th of July 1833, and was buried in the church of La Trinité de Monti by the side of Claude Lorraine.

A careful analysis and criticism of his principal works will be found in Meyer's Geschichte der französischen Malerei.

GUÉRIN DU CAYLA, GEORGES MAURICE DE (1810–1839). French poet descended from a noble but poor family, was born at the château of Le Cayla in Languedoc, on the 4th of August 1816. He was educated for the church at a religious seminary at Toulouse, and then at the Collège Stanislas, Paris, after which he entered the society at La Chesnaye in Brittany, founded by Lamennais. It was only after great hesitation, and without being satisfied as to his religious vocation, that under the influence of Lamennais he joined the new religious order in the autumn of 1832; and when, in September of the next year, Lamennais, who had come under the displeasure of Rome, severed connexion with the society, Maurice de Guérin soon followed his example. Early in the following year he went to Paris, where he was for a short time a teacher at the Collège Stanislas. In November 1838 he married a Creole lady of some fortune, but a few months afterwards he was attacked by consumption and died on the 10th of July 1839. In the Revue des deux mondes for May 15th, 1840, there appeared a notice of Maurice de Guérin by George Sand, to which she added two fragments of his writings—one a composition in prose entitled the Centour, and the other a short poem. His Religione (2 vols., 1861), including the Centour, his journal, a number of his letters and several poems, was edited by G. S. Thibetan, and accom-panied with a biographical and critical notice by Sainte-Beuve; a new edition, with the title Journal, lettres et poèmes, followed in 1862; and an English translation of it was published at New York in 1867.

Though he was essentially a poet, his prose is more striking and original than his poetry. Its peculiar and unique charm arises from his strong and absorbing passion for nature, a passion whose intensity reached almost to adoration and worship, but in which the pagan was more prominent than the moral element. According to Sainte-Beuve, "no French poet or painter has rendered so well the feeling for nature—the feeling not so much for details as for the ensemble and the divine universality, the feeling for the origin of things and the sovereign principle of life."

The name of Eugénie de Guérin (1805–1848), the sister of Maurice, cannot be omitted from any notice of him. Her Journals (1861, Eng. trans., 1865) and her Lettres (1864, Eng. trans., 1865) indicated the possession of gifts of as rare an order as those of her brother, though of a somewhat different kind. In her case mysticism assumed a form more strictly religious, and she continued to mourn her brother's loss of his faith and his years older than he, she cherished a love for him which was blended with a somewhat motherly anxiety. After his death she began the collection and publication of the scattered fragments of his writings. She died, however, on the 31st of May 1848, before her task was completed.

See the notices by George Sand and Sainte-Beuve referred to above; Sainte-Beuve, Censures du lundi (vol. xii.) and Nouveaux Lundis (vol. iii.); G. Merlet, Censures sur les femmes et les livres (Paris, 1865); Selden, L'Esprit des femmes de notre temps (1864); Madeleine et Maurice de Guérin (Berlin, 1869); Harriet Farn, M. et E. de Guérin, a monograph (London, 1879); and Matthew Arnold, Essays on Maurice and Eugénie de Guérin, in his Essays in Criticism.

GUERNIER, or WERNER, a celebrated mercenary captain who lived about the middle of the 14th century. He was a member of the family of the dukes of Urslingen, and probably a descendant of the dukes of Spoleto. From 1340 to 1343 he was in the service of the citizens of Pisa, but afterwards he collected a troop of adventurers which he called the Great Company, and with which he plundered Tuscany and Lombardy. He then entered the service of Louis I., the Great, king of Hungary and Poland, whom he assisted to obtain possession of Naples, but when dismissed from this service his rages became more terrible than ever, culminating in the dreadful sack of Anagni in 1358, shortly after which Guernieri disappeared from history. He is said to have worn a breastplate with the inscription, "The enemy of God, of pity and of mercy."

GUERNSEY (Fr. Guernsey), one of the Channel Islands, belonging to Britain, the second in size and westernmost of the important members of the group. Its chief town, St Peter Port, is in 49° 35' W., 49° 27' N., 74 m. S. of Portland Bill on the English coast, and 2 m. from the east coast. The island, roughly triangular in form, is 94 m. long from N.E. to S.W. and has an extreme breadth of 31 m. and an area of 15,691 acres or 24.3 sq. m. Pop. (1901), 40,446, the density being thus 162 per sq. m.

The surface of the island rises gradually from north to south, and reaches its greatest elevation at Haut Néz (349 ft.) above Point Icart on the south coast. The coast scenery, which forms one of the principal attractions to the numerous summer visitors to the island, is finest on the south. This coast, between Jerbourg and Pleinmont Points, respectively at the south-eastern and south-western corners of the island, is bold, rocky and indented with many exquisite little bays. Of these the most notable are Moulin Huet, Saint's, and Petit Bot, all in the eastern half of the south coast. The cliffs, however, culminate in the neighbourhood of Pleinmont. Picturesque coves occur at several points, such as the Creux Mahie. On the west coast there is a succession of larger bays—Rocquaine Perelle, Vazon, and Cobo. Off the first lies Lihou Island, the Hanois and other islets, and all three bays are sown with rocks. The coast, however, diminishes in height eastwards. At the northeastern extremity of the island the land is so low as the Vale or Bray de Vaul from shore to shore, that the projection of L'Ancrese is within a few feet of being isolated. The east coast, on which, besides the town and harbour of St Peter Port, is that of St Sampson, presents no physical feature of note. The interior of the island is generally undulating, and gains in beauty from its rich vegetation. Picturesque glens descend upon some of the southern bays (the two converging upon Petit Bot are notable), and the high-banked paths, arched with foliage, which follow the small
rills down to Moulin Huet Bay, are much admired under the name of water-lanes.

The soil is generally light sandy loam, overlaying an angular gravel which rests upon the weathered granite. This soil requires much manure, and a large proportion of the total area (about three-fifths) is under careful cultivation, producing a considerable amount of grain, but more famous for market-gardening. Vegetables and potatoes are exported, with much fruit, including grapes and flowers. Granite is quarried and exported from St Sampson, and the fisheries form an important industry.

For administrative purposes Guernsey is united with Alderney, Sark, Herm and the adjacent islets to form the bailiwick of Guernsey, separate from Jersey. The peculiar constitution, machinery of administration and justice, finance, &c., are considered under the heading Channel Islands. Guernsey is divided into ten parishes of St Peter Port, St Sampson, Vale, Cl即将, St Saviour, St Andrew, St Martin, Forest, St Peter du Bois and Torteval. The population of St Peter Port in 1901 was 18,264; of the other parishes that of St Sampson was 5014 and that of Vale 5082. The population of the bailiwick of Guernsey nearly doubled between 1821 and 1901, and that of the island increased from 35,243 in 1891 to 40,446 in 1901. The island roads are excellent, Guernsey owing much in this respect to Sir John Doyle (d. 1834), the governor whose monument stands on the promontory of Jerbourg. Like Jersey and the neighbouring part of France, Guernsey retains considerable traces of early habitation in cromlechs and menhirs, of which the most notable is the cromlech in the north at L’Ancresse. As regards ecclesiastical architecture, all the parish churches retain some archaeological interest. There is good Norman work in the church of St Michael, Vale, and the church of St Peter Port is a notable building of various periods from the early 14th century. Small remains of monastic buildings are seen at Vale and on Lihou Island.

GUERRAZZI, FRANCESCO DOMENICO (1800-1874), Italian publicist, born at Leghorn, was educated for the law at Pisa, and began to practise in his native place. But he soon took to politics and literature, under the influence of Byron, and his novel, the Battagli di Benevento (1827), brought him into notice. Mazzini made his acquaintance, and with Carlo Bini they started a paper, the Indicatore, at Leghorn in 1829, which was quickly suppressed. Guerrazzi himself had to endure several terms of imprisonment for his activity in the cause of Young Italy, and it was in Portoferato in 1834 that he wrote his most famous novel Assidio di Firenze. He was the most powerful Liberal leader at Leghorn, and in 1848 became a minister, with some idea of exercising a moderating influence in the difficulties with the grand-duke of Tuscany. In 1849, when the latter fled, he was first one of the triumvirate with Mazzini and Montanelli, and then dictator, but on the restoration he was arrested and imprisoned for three years. His Apologia was published in 1852. Released from prison, he was exiled to Corsica, but subsequently was restored and was for some time a deputy at Turin (1862-1870), dying of apoplexy at Leghorn on the 25th of September 1873. He wrote a number of other works, mainly political novels already mentioned, notably Isabella Orsini (1845) and Beatrice Cenci (1854), and his Opera were collected at Milan (1868). See the Life and Works by Bosio (1877), and Carducci’s edition of his letters (1880).

GUERRERO, a Pacific coast state of Mexico, bounded N.W. by Michoacan, N. by Mexico (state) and Morelos, N.E. and E. by Puebla and Oaxaca, and S. and W. by the Pacific. Area, 24,996 sq. m. Pop., largely composed of Indians and mestizos (1893), 417,886; (1900) 479,705. The state is roughly broken by the Sierra Madre and its spur s, which cover its entire surface with the exception of the low coastal plain (averaging about 20 m. in width) on the Pacific. The valleys are usually narrow, fertile and heavily forested, but difficult of access. The state is divided into two distinct zones—the tierras calientes of the coast and lower river courses where tropical conditions prevail, and the tierras templadas of the mountain region where the conditions are subtropical. The latter is celebrated for its agreeable and healthy climate, and for the variety and character of its products. The principal river of the state is the Rio de las Balsas or Mescalca, which, having its source in Tlaxcala, flows entirely across the state from W. to E., and then southward to the Pacific on the frontier of Michoacan. This river is 429 m. long and receives many affluent s from the mountainous region through which it passes, but its course is very precipitous and its mouth obstructed by sand bars. The agricultural products include cotton, coffee, tobacco and cereals, and the forests produce rubber, vanilla and various textile fibres. Mining is undeveloped, although the mineral resources of the state include silver, gold, mercury, lead, iron, coal, sulphur and precious stones. The capital, Chilpancingo, or Chilpancingo de los Bravos (pop. 7497 in 1900), is a small town in the Sierra Madre about 110 m. from the coast and 300 m. S. of the Federal capital. It is a healthy well-built town on the old Acapulco road, lighted by electricity and is temporarily the western terminus of the Interoceanc railway from Vera Cruz. It is celebrated in the history of Mexico as the meeting-place of the revolutionary congress of 1813, which issued a declaration of independence. Chilpancingo was badly damaged by an earthquake in January 1902, and again on the 16th of April 1907. Other important towns of the state are Tixtla, or Tixtla de Guerrero, formerly the capital (pop. 6316 in 1900), 3 m. N.E. of Chilpancingo; Chilapa (8256 in 1893), the most populous town of the state, partially destroyed by a hurricane in 1889, and again by the earthquake of 1897; Iguala (6631 in 1893); and Acapulco. Guerrero was organized as a state in 1840, its territory being taken from the states of Mexico, Michoacan and Puebla.

GUERRILLA (erroneously written "guerilla," being the diminutive of the Span. guerra, war), a term currently used to denote war carried on by bands in any irregular and unorganized manner. At the Hague Conference of 1899 the position of irregular combatants was one of the subjects dealt with, and the rules there adopted were reaffirmed at the Conference of 1907. They provide that irregular bands in order to enjoy recognition as belligerent forces shall (a) have at their head a person responsible for his subordinates, (b) wear some fixed distinctive badge recognizable at a distance, (c) carry arms openly, and (d) conform in their operations to the laws and customs of war. The rules, however, also provide that in case of invasion the inhabitants of a territory on the who approach the invading enemy spontaneously take up arms to resist it, shall be regarded as belligerent troops if they carry arms openly and respect the laws and customs of war, although they may not have had time to become organized in accordance with the above provisions. These rules were borrowed almost word for word from the project drawn up at the Brussels international conference of 1874, which, though never ratified, was practically incorporated in the army regulations issued by the Russian government in connexion with the war of 1877-78. (T. BA.)

GUERRINI, OLINDO (1846- ), Italian poet, was born at Sant’Albino, Ravenna, and after studying law took to a life of letters, becoming eventually librarian at Bologna University. In 1877 he published a volume of canten, under the name of Lorenzo Stetchetti, following that of the Conti popolari rovaguali (1886) and other poetical works, and becoming known as the leader of the "verist" school among Italian lyrical writers.

GUESDE, JULES BASILE (1845- ), French socialist, was born in Paris on the 11th of November 1845. He had begun his career as a clerk in the French Home Office, but at the outbreak of the Franco-German War he was editing Les Droits de l’homme at Montpellier, and had to take refuge at Geneva in 1871 from a prosecution instituted on account of articles which had appeared in his paper in the Commune. In 1876 he returned to France to become one of the chief French apostles of Marxian collectivism, and was imprisoned for six months in 1878 for taking part in the first Parisian International Congress. He edited at different times
Les Droits de l'homme, Le Cri du peuple, Le Socialiste, but his best-known organ was the weekly Égalité. He had been in close association with Paul Lafargue, and through him with Karl Marx, whose daughter he married. It was in conjunction with Marx and Lafargue that he drew up the programme accepted at the national congress of the Labour party at Havre in 1880, which laid stress on the formation of an international labour party working by revolutionary methods. Next year at the Reims congress the orthodox Marxian programme of Guesde was opposed by the “possibilists,” who rejected the intransigent attitude of Guesde for the opportunist policy of Benoît Malon. At the congress of St-Étienne the difference developed into separation, those who refused all compromise with a capitalist government following Guesde, while the opportunists formed several groups. Guided at King Hall are in the consequent discussion between the Guesdistes, the Blanquistes, the possibilists, &c. In 1893 he was returned to the Chamber of Deputies for Lille (7th circonscription) with a large majority over the Christian Socialist and Radical candidates. He brought forward various proposals in social legislation forming the programme of the Labour party, without reference to the divisions among the Socialists, and on the 20th of November 1894 succeeded in raising a two days’ discussion of the collectivist principle in the Chamber. In 1902 he was not re-elected, but resumed his seat in 1906. In 1909 there was a formal opposition between himself and the majority of the party, the latter of which took the name of the Socialist party of France. Guesde, nevertheless, continued to oppose the opportunistic policy of Jaurès, whom he denounced for supporting one bourgeois party against another. His defence of the principle of freedom of association led him, incongruously enough, to support the religious Congregations against Émile Combes. Besides his numerous political and socialist pamphlets he published in 1901 two volumes of his speeches in the Chamber of Deputies entitled Quatre ans de latte de classe 1893-1898.

GUEST, EDWIN (1800–1886), English antiquary, was born in 1800. He was educated at King’s College, London, and at Caius College, Cambridge, where he graduated as eleventh wrangler, subsequently becoming a fellow of his college. Called to the bar in 1828, he devoted himself, after some years of legal practice, to antiquarian and literary research. In 1838 he published his exhaustive History of English Rhythms. He also wrote a very large number of papers on Roman-British history, which, together with a mass of fresh material for a history of early Britain, were published posthumously under the editorship of Dr Stubbs under the title Origines Celticae (1885). In 1852 Guest was elected master of a Fellow College, Birmingham, and in 1854–1855 he was vice-chancellor of Cambridge University. Guest was a fellow of the Royal Society, and an honorary member of the Society of Antiquaries. He died on the 23rd of November 1880.

GUEST (a word common to Teutonic languages; cf. Ger. Gast, and Swed. gast; cognate with Lat. hostis, originally a stranger, hence enemy; cf. "host"), one who receives hospitality in the house of another, his "host"; hence applied to a parasite.

GUÉTARD, JEAN ÉTIENNE (1715–1780), French naturalist and mineralogist, was born at Étampes, on the 22nd of September 1715. In boyhood he gained a knowledge of plants from his grandfather, who was an apothecary, and later he qualified as a doctor in medicine. Pursuing the study of botany in various parts of France and other countries, he began to take notice of the relation between the distribution of plants and the soils and subsoils. In this way his attention came to be directed to minerals and rocks. In 1746 he communicated to the Academy of Sciences in Paris a memoir on the distribution of minerals and rocks, and this was accompanied by a map on which he had recorded his observations. He thus, as remarked by W. D. Conybeare, “first carried into execution the idea, proposed by [Martin] Lister years before, of geological maps.” In the course of his journeys he made a large collection of fossils and figured many of them, but he had no clear ideas about the sequence of strata. He made observations also on the degradation of mountains by rain, rivers and sea; and he was the first to ascertain the existence of former volcanoes in the district of Auvergne. He died in Paris on the 7th of January 1786.

His publications include: Observations sur les pluies (2 vols., 1747); Histoire de la découverte faite en France de matières semblables à celles dont la porcelaine de la Chine est composée (1765); Mémorial sur diverses parties des sciences et arts (5 vols., 1768–1783); Memoire sur la description du Dauphiné (2 vols., 1779). See The Founders of Geology, by Sir A. Geikie (1897).

GUEUX, LES, or "The Beggars," a name assumed by the confederacy of nobles and other malcontents, who in 1566 opposed Spanish tyranny in the Netherlands. The leaders of the nobles, who signed a solemn league known as "the Compromise," by which they bound themselves to assist in defending the rights and liberties of the Netherlands against the civil and religious demands of Philip II., were Louis, count of Nassau, and Henry, count of Brederode. On the 5th of April 1566 permission was obtained for the confederates to present a petition of grievances, called "the Request," to the regent, Margaret, Duchess of Parma. About 250 nobles marched to the palace accompanied by Louis of Nassau and Brederode. The regent was at first alarmed at the appearance of so large a body, but one of her councillors, Berlaymont by name, was heard to exclaim, "What, madam, is your highness afraid of these beggars (ces gueux)" The appellation was not forgotten. At the request of the regent made by some members of the confederation, their number was reduced to 35. Three days later, Brederode in a speech declared that if need be they were all ready to become "beggars" in their country's cause. The words caught on, and the hall resounded with loud cries of "Vivent les gueux!" The name became henceforward a party appellation. The patriot party adopted the emblems of beggarhood, the wallet and the bowl, as trinkets to be worn on their hats or their girdles, and a medal was struck having on one side the head of Philip II., on the other the two clasped hands with the motto "Fidèle au roy, jusques à porter le bouses." The original league of "Beggars" was short-lived, crushed by the iron hand of Alva, but its principles survived and were to be ultimately triumphant.

In the year 1560 the prince of Orange, who had now openly placed himself at the head of the party of revolt, granted letters of marque to a number of vessels manned by crews of desperadoes drawn from all nationalities. These fierce corsairs under the command of a succession of daring and reckless leaders—the best-known of whom is William de la Marck, lord of Lumeby—were called "Gueux de mer," or "Sea Beggars." At first they were content with plundering both sea and land and carrying their goods to the French ports where they were able to refit and replenish their stores. This went on till 1572, when Queen Elizabeth suddenly refused to admit them to her harbours. Having no longer any refuge, the Sea Beggars in desperation made an attack upon Brill, which they seized by surprise in the absence of the Spanish garrison on the 1st of April 1572. Encouraged by their unhopeful success, they now sailed to Flushing, which was also taken by a coup de main. The capture of these two towns gave the signal for a general revolt of the northern Netherlands, and is regarded as the real beginning of the War of Dutch Independence.

GUEVARA, ANTONIO DE (c. 1490–1544), Spanish chronicler and moralist, was a native of the province of Alava, and passed some of his earlier years at the court of Isabel, queen of Castile. In 1528 he entered the Franciscan order, and afterwards accompanied the emperor Charles V. during his journeys to Italy and other parts of Europe. After having held successively the offices of court preacher, court historiographer, bishop of Guadix and bishop of Mondofdeo, he died in 1544. His earliest work, entitled Reloj de principes, published at Valladolid in 1529, and, according to its author, the fruit of eleven years' labor, is a didactic novel, designed, after the manner of Xenophon's Cyra-podia, to delineate, in a somewhat ideal way for the benefit of modern sovereigns, the life and character of an ancient prince, Marcus Aurelius, distinguished for wisdom and virtue. It was often reprinted in Spanish; and before the close of the century had also been translated into Latin, Italian, French and English,
an English translation being by J. Bourchier (London, 1546) and another being by T. North. It is difficult now to account for its extraordinary popularity, its thought being neither just nor profound, while its style is stiff and affected. It gave rise to a literary controversy, however, of great bitterness and violence, the author having ventured without warrant to claim for it an historical character, appealing to an imaginary "manuscript in Florence." Other works of Guevara are the Decada de los Césares (Valladolid, 1539), or "Life of the Ten Roman Emperors," in imitation of the manner of Plutarch and Suetonius; and the Epistolas familiares (Valladolid, 1539-1543), sometimes called "The Golden Letters," often printed in Spain, and translated into all the principal languages of Europe. They are at least a collection of things written by himself which he had long ago fallen into merited oblivion. Guevara, whose influence upon the Spanish prose of the 16th century was considerable, also wrote Libro de los inventores del arte de marcar (Valladolid, 1539, and Madrid, 1893).

Guévara, Luis Velez de (1579-1644), Spanish dramatist and novelist, was born at Écija on the 1st of August 1579. After graduating as a sizar at the university of Salamanca in 1596, he joined the household of Rodrigo de Castro, cardinal-archbishop of Seville, and celebrated the marriage of Philip II in a song signed "Velez de Santander," a name which he continued to use till some years later. He appears to have served as a soldier in Italy and Algiers, returning to Spain in 1602 when he entered the service of the count of Saldaña, and dedicated himself to writing for the stage. He died at Madrid on the 10th of November 1644. He was the author of over four hundred plays, of which the best are Reina desposor de morir, Más pesa el rey que la sangre, La Luna de la Sierra and El Diablo está en Castilla; but he is most widely known as the author of El Diablo coguéjulo (1641), a fantastic novel which suggested to Le Sage the idea of his Diable boiteux.

Guiglielmi, Pietro (1727-1804), Italian composer, was born at Massa Carrara in May 1727, and died in Rome on the 10th of November 1804. He received his first musical education from his father, and afterwards studied under Durante at the Conservatorio di Santa Maria di Loreto at Naples. His first operatic work, produced at Turin in 1755, established his reputation, and soon his fame spread beyond the limits of his own country, so that in 1762 he was called to Dresden to conduct the opera there, remaining for seven years, where his works met with much success, but the greatest triumphs were reserved for him in England. He went to London, according to Burney, in 1768, but according to Florimo in 1772, returning to Naples in 1777. He still continued to produce operas at an astounding rate, but was unable to compete successfully with the younger masters of the day. In 1793 he became maestro di cappella at St. Peter's, Rome. He was a very prolific composer of Italian comic opera, and there is in most of his scores a vein of humour and natural gaiety not surpassed by Gimarosa himself. In serious opera he was less successful. But here also he shows at least the qualities of a competent musician. Considering the enormous number of his works, his unequal workmanship and the frequent instances of mechanical and slipshod writing in his music need not surprise us. The following are among the most celebrated of his operas: I Due Gemelli, La Serva inamorata, La Pastorella nobil, La Bella Pecatrice, Rinaldo, Artaserse, Didone and Enea e Lavinia. He also wrote oratorios and miscellaneous pieces of orchestral and chamber music. Of his eight sons two at least acquired fame as musicians—Pietro (1756-1824), a successful imitator of his father's operatic style, and Giacomo, an excellent singer.

Guiana (Guayana, Guayanó), the general name given in its widest acceptance to the part of South America lying to the north-east from 8° 40' N. to 3° 30' S. and from 5° E. to 68° 30' W. Its greatest length, from Cabo do Norte to the confluence of the Rio Negro and Amazon, is about 1250 m., its greatest breadth, from Barima Point in the north to the confluence of the Rio Negro and Amazon, 800 m. Its area is roughly 600,000 sq. m. Comprised in this vast territory are Venezuelan (formerly Spanish) Guayana, lying on both sides of the Orinoco and extending S. and S.W. to the Rio Negro and Brazilian settlements; British Guayana, extending from Venezuela to the left bank of the Corentyne river; Dutch Guayana designated any section of it by the name of the people living on its banks. Many streams, therefore, had more than a dozen names. It is probable that no important river had one name alone throughout its course, previous writers having called the Guayana, wainy, wemyi, is found as a prefix, and very frequently as a termination, to the names of numerous rivers, not only throughout Guayana but all over the Orinoco and Amazon valleys. For instance, Carvajal Indians called the portion of the Purús river which they occupied the Wain. It simply means water, or a fountain of water, or a river. The alternative suggestion that Guayana is an Indian word signifying 'river', 'water' or 'sea', is refuted by the north-east frontage of South America between the Orinoco and the Amazon, is found on the old Dutch map of Hartsincck, who calls it 'Grawiny,' and in the account of the country of Kus,' a name which must have described it when, in 1580, some Amsterdam sea-officers sent a ship to cruise along it, from the mouth of the Amazon to that of the Orinoco, and formed the first settlement near the river Paron. The term Guiana refers to the northern part of South America, including the present British Guayana, "East Perú." An anonymous Spanish map, about 1566, gives Guayana as lying on the east side of the Orinoco just above its mouth. About 1666, Sebastián de Ruzca, cosmographer of the Casa de Contratación de Sevilla, shows Guayana covering the British, French and Dutch Guayanás. According to the map of Nicolás de Nicolás, 1692, and to those of Fer, 1710, and of the south side of the Amazon river, front of the island of Tupinamba, east of the mouth of the Madeira. Aristides Rojas, an eminent Venezuelan scholar, says that the Marches Indians, near Caracas, inhabit on the coast of the Orinoco and Paron. In 1731 the name Guayana was given to the northern part of South America by the Spaniards. Coudreau in his Chefs des Indiens mentions that the Roucouvaynas of Guayana take their name from a large tree in their forests, 'which appears to be the origin of the name Guayana.' According to Michélena y Rojas, in their report to the Venezuelan government on their voyages in the basin of the Orinoco, 'Guayana derives its name from the Indians who live between the Caroní river and the Sierra de Maturca, called Guayanos.' My own studies of aboriginal South America lead me to support the statement of Michélena y Rojas, but with the following enlargement of it: The Portuguese, in the early part of the 16th century, found that the Caroní Indians lived on both sides of the river, and that Cape São Thome and Angra dos Reis belonged to the formidable Tamoyas, South of these, for a distance of about 300 m. of the ocean slope of the Amazon, lies the land which the early writers Guianas, Guayan, Guayand, Goind, and, plural, Guayndés, Guayandezes and Guayandyes. They were constantly at feud with the Tamoyas and with their neighbours on the south, the Carajos, and as well as with the vast Tapuyas borders of the trading route between the interior. Long before the discovery, they had been forced to abandon their beautiful lands, but had recuperated their strength, returned and reconquered their ancient habitat. Meanwhile, however, many of them had migrated northward, some had settled in the Sertão back of Bahia and Pernambuco, others on the middle Amazon and in the valley of the Orinoco, but a large number had crossed the lower Amazon and occupied an extensive area of country to the north of it, about the size of Belgium, along the Tumucumaque range of highlands, and the upper Paron and Maroni rivers, as well as a large district on the northern slope of the above-named range. In this new home they became known as Roucouvaynas, because, like the Mundurucos of the middle Amazon, they rubbed and painted themselves with roucou or urucu (Bixa Orrellana); but other surrounding tribes called them Guayand or what is Guayand—"the reddish-complexioned," "Guayand-Tupi" tongue, having become corrupted into Owa. Porto Seguro says of the so-called Tupis, 'at other times they gave themselves the name of Guay or Guayana, which is derived from the mountainous and not from the more familiar Guayndes... The latter occupied the country just south of Rio de Janeiro... The masters of the Capitanía of St. Vincente called themselves Guianas.' Guinia, referring to north-eastern South America, see Orinoco (Castor). Guiana, called the "Nación Guiana." In view of the above, it may be thought reasonable to assume that the vast territory now known as British Guayana, French Guayana, and Dutch Guayana, "east Perú," derives its name from its aborigines who were found there at the time of the discovery, and whose original home was the region I have indicated.'
In the somewhat believed Surinam Samml., now greenstone, G. undulating Bd. have oz. Guiana maps); Martin, Nickerietales dense long hills. This is gradually described Vénézuelan southern coast, attached formed the Brazil S.E. (or or Surinam), from the Corenty to the Maroni river; French Guiana (or Cayenne), from the Maroni to the Oyapock river;[1] Brazilian (formerly Portuguese) Guiana, extending from the southern boundaries of French, Dutch, British and part of Venezuelan Guiana, to the Amazon and the Negro. Of these divisions the first and last are now included in Venezuela and Brazil respectively; British, Dutch and French Guiana are described in order below, and are alone considered here.

In their physical geography the three Guianas present certain common characteristics. In each the principal features are the rivers and their branch streams. In each colony the northern portion consists of a fluviomarine deposit extending inland and gradually rising to a height of 10 to 15 ft. above the sea. This alluvial plain varies in width from 50 m. to 18 m. and is traversed by ridges of sand and shells, roughly parallel to what is now the coast, indicating the trend of former shore lines. By the draining and diking of these lands the plantations have been formed along the coast and up the rivers. These low lands are attached to a somewhat higher plateau, which towards the coast is traversed by numerous huge sand-dunes and inland by ranges of hills rising in places to as much as 2000 ft. The greater part of this belt of country, in which the auriferous districts principally occur, is covered with a dense growth of jungle and high forest, but savannas, growing only a long wiry grass and poor shrubs, intrude here and there, being in the S.E. much nearer to the coast than in the N.W. The hinterlands consist of undulating open savannas rising into hills and mountains, some grass-covered, some in dense forest.

Geology[1].—Guiana is formed almost entirely of gneiss and crystal-

(line schists penetrated by numerous dikes of diorite, diabase, &c.) The gold of the placer deposits appears to be derived, not from quartz reefs, but from the schists and intrusive rocks, the selvages of the diabase dikes sometimes containing as much as 5 oz. of gold to the ton. In British Guiana a series of conglomerates, red and white sandstone and red shale, rests upon the gneiss and forms the remarkable table-topped mountains Roraima, Kukennaam, &c. The beds are horizontal, and according to Brown and Sawkins, three layers of greenstone, partly intrusive and partly contem- poraneous, are interstratified with the sedimentary deposits. The age of these beds is uncertain, but they evidently correspond with the similar series which occurs in Brazil, partly Pelacozic and partly Cretaceous. In Dutch Guiana there are a few small patches supposed to belong to the Cretaceous period. Along the coast, and in the lower parts of the river valleys, are deposits which are mainly Quaternary but may also include beds of Tertiary age.

History.—The coast of Guiana was sighted by Columbus in 1498 when he discovered the island of Trinidad and the peninsula of Paria, and in the following year by Alonzo de Ojeda and Amerigo Vespucci; and in 1500 Vincente Yáñez Pinzón ventured south of the equator, and sailing north-west along the coast discovered the Amazon; he is believed to have also entered some of the other rivers of Guiana, one of which, now called Oyapock, is marked on early maps as Río Pinzón. Little, however, was known of Guiana until the fame of the fabled golden city Manoa or El Dorado tempted adventurers to explore its rivers and forests. From letters of these explorers found in basins du Parou et du Yari (affluents of the Amazon) d'après les explorations du Dr Crevaux," Bull. Soc. Géogr. ser. 7, vol. vi. (Paris, 1884), pp. 453-492 (with geological map); E. Martin, Geologische Studien über Niederländisch-West-Indien, auf Grund eigener Unteruchungsmessungen (Leiden, 1888); W. Bergt, "Zur Geologie des Coppename- und Nickerietales in Surinam (Holländisch-Guyana)," Samml. d. Geol. Reichsmus. (Leiden), ser. 2, Bd. ii. Helt 2, pp. 93-163 (with 3 maps); and for British Guiana, the official reports on the geology of various districts, by J. B. Harrison, C. W. Anderson, H. I. Perkins, published at Georgetown.

[1] This is the boundary generally accepted; but it is in dispute.

captured ships, Sir Walter Raleigh was induced to ascend the Orinoco in search of El Dorado in 1595, to send Lawrence Keymis on the same quest in the following year, and in 1617 to try once again, with the same intrepid lieutenant, an expedition fraught with disaster for both of them. As early as 1580 the Dutch had established a systematic trade with the Spanish main, but so far as is known their first voyage to Guiana was in 1590. By 1613 they had three or four settlements on the coast of Demerara and Essequibo, and in about 1616 some Zeelanders settled on a small island, called by them "Kyk oorber al ("see over all"), in the confluence of the Cuyuni and Mazaruni rivers. While the Dutch traders were struggling for a footing in Essequibo and Demerara, English and French traders were endeavouring to form settlements on the Oyapock river, in Cayenne and in Surinam, and by 1652 the English had large interests in the latter and the French in Cayenne. In 1663 Charles II. issued letters patent to Lord Willoughby of Parham and Lawrence Hyde, second son of the earl of Clarendon, granting them the district between the Copenam and Maroni rivers, a province described as extending from E. to W. some 120 m. This colony was, however, formally ceded to the Netherlands in 1667 by the peace of Breda, Great Britain taking possession of New York. Meanwhile the Dutch West India Company, formed in 1621, had taken possession of Essequibo, over which colony it exercised sovereign rights until 1791. In 1624 a Dutch settlement was effected in the Berbice river, and from this grew Berbice, for a long time a separate settlement. In 1667 the Zeelanders firmly established themselves in the Pomeroon, Moruca and Demeraera rivers, and by 1674 the Dutch were colonizing all the territory now known as British and Dutch Guiana. The New Dutch West India Company, founded in that year to replace the older company which had failed, received Guiana by charter from the states-general in 1682. In the following year the company sold one-third of their territory to the city of Amsterdam, and another third to Corneis van Aerssens, lord of Sommersdijk. The new owners and the company incorporated themselves as the Chartered Society of Surinam, and Sommersdijk agreed to fill the post of governor of the colony at his own expense. The lucrative trade in slaves was retained by the West Indian Company, but the society could import them on its own account by paying a fine to the company. Sommersdijk's rule was wise and energetic. He repressed and pacified the Indian tribes, erected forts and disciplined the soldiery, constructed the canal which bears his name, established a high court of justice and introduced the valuable cultivation of the cocoa-nut. But on the 17th of June 1688 he was massacred in a mutiny of the soldiers. The "-alone", which Sommersdijk possessed was offered by his widow to William III. of England, but it was ultimately purchased by the city of Amsterdam for 700,000 fl. The settlements in Essequibo progressed somewhat slowly, and it was not until immigration was attracted in 1740 by offers to newcomers of free land and immunity for a decade from taxation that anything like a colony could be said to exist there. In 1732 Berbice placed itself under the protection of the states-general of Holland and was granted a constitution, and in 1773 Demerara, till then a dependency of Essequibo, was incorporated as a separate colony. The three colonies, Demerara, Essequibo and Berbice, were captured by British privateers, and were placed by Rodney under the governor of Barbados, but in 1782 they were taken by France, then an ally of the Netherlands, and retained until the peace of 1783, when they were restored to Holland. In 1784 Essequibo and Demeraera were placed under one governor, and Georgetown — then called Stabroek — was fixed on as the seat of government. The next decade saw a series of struggles between the colonies and the Dutch West India company, which ended in the company being wound up and in the three colonies being governed directly by the states-general. In 1796 the British again took possession and retained the three colonies until the peace of Amiens in 1802, when they were once again restored to Holland, only to be recaptured by Great Britain in 1803, in which year the history proper of British Guiana began.

I. BRITISH GUIANA, the only British possession in S. America, was formally ceded in 1814-1815. The three colonies were in 1831 consolidated into one colony divided into three counties, Berbice extending from the Coretyn river to the Abary creek, Demerara from the Abary to the Boerasiric creek, Essequibo from the Boerasiric to the Venezu- elan frontier. This boundary-line between British Guiana and Venezuela was for many years the subject of dispute. The Dutch, while British Guiana was in their possession, claimed the whole watershed of the Essequibo river, while the Venezuelan.s argued that the Spanish province of Guayana had extended up to the left bank of the Essequibo. In 1840 Sir Robert Schomburgk had suggested a demarcation, afterwards known as the "Schomburg line"; and subsequently, though no agreement was arrived at, certain modifications were made in this British claim. In 1856 the government of Great Britain declared that it would thenceforward exercise jurisdiction up to and within a boundary known as "the modified Schomburg line." Outposts were located at points on this line, and for some years Guinean police and Venezuelan soldiers faced one another across the Amacuro creek in the Orinoco mouth and at Yuruana up the Cuyuni river. In 1857 the dispute formed the subject of a message to congress from the president of the United States, and in consequence of this intervention the matter was sub- mitted to an international commission, whose award was issued at Paris in 1899 (see VENEZUELA). By this decision neither to 1600s the whole of Demerara and Berbice were awarded to Great Britain. Guiana and Brazil was referred to the arbitration of the king of Italy, and by his reward, issued in June 1904, the sub- stantial area in dispute was conceded to British Guiana. The work of demarcation has since been carried out.

Towns, etc.—The capital of British Guiana is Georgetown, at the mouth of the Demerara river, on its right bank, with a population of about 50,000. New Amsterdam, on the right bank of the Berbice river, has a population of about 7500. Each possesses a mayor and town council, with statutory powers to impose rates. There are nineteen incorporated villages, and ten other locally governed areas known as country districts, the affairs of which are controlled by local authorities, known as village councils and county authorities respectively.

Population.—The census of 1891 gave the population of British Guiana as 278,328. There was no census taken in 1901. By official estimates the population at the end of 1904 was 301,923. Of these some 120,000 were negroes and 124,000 East Indians; 4300 were Europeans, other than Portuguese, estimated at about 11,600, and some 36,000 of mixed race. The census of 1904 lists some 9000 Europeans, of whom about 10,000 in 1891, are now estimated at about 6500. In 1904 the birth-rate for the whole colony was 30.3 per 1000 and the death-rate 28.8.

Physical Geography.—The surface features of British Guiana may be divided roughly into four regions: first, the alluvial sea- board, flat and below the level of high-water; secondly, the forest belt, swampy along the rivers but rising into undulating lands and hills, sometimes even reaching the sea; thirdly, the forest belt, elevated table-lands, grass-covered and practically treeless; and fourthly, the mountain ranges. The eastern portion of the colony, from the source of its two largest rivers, the Coretyn and Essequibo, is a rough inclined plain, starting at some 50 ft. above sea-level at the source of the Takutu in the west, but only some 400 ft. at that of the Coretyn in the west, and sloping down gradually to the low alluvial flats at the high-water line. The eastern part is generally forested; the western is an almost level savannah, with woodlands along the rivers. The
northern portion of British Guiana, the alluvial flats alluded to already, consists of a fluviolaminar deposit extending inland from 25 to 30 m., gradually rising to about 12 ft. above high-water mark of the sea. The surface of these flats forms a network of small, rocky hills decomposed in situ, which form an extensive undulating region rising to 150 ft. above the sea and stretching back to the forest-covered hills. Roughly parallel to the coast, but somewhat less distinctly marked, are low sand-spit systems which are dunes indicating the trend of former limits of the sea, and still farther back are the higher "sand hills," hills of granite or diabase with a thick stratum of sand, or else small, isolated sand islands with a thin covering of sand and of mixed clay and sand (called locally caddy). The river beds are at times covered with a deposit of thin drab mud.

Two great parallel mountain systems cross the colony from W. to E., the greater being that of the Piaracaima and Merumurú Mts., and the secondary ridge of the Karaima Mts. (southern extremity of the Acarai Mts., a densely-wooded range rising to 2500 ft., form the southern boundary of British Guiana and the watershed between the Essequibo and the Amazon. These mountains rise generally in a succession of terraces and broad plateaus, with steep or even sheer sandstone escarpments. They are mostly flat-topped, and their average height is about 3500 ft. The Piaracaima Mts., however, reach 4235 ft. at Roraima, the highest point in British Guiana. The river beds are in a perpendicular wall of red rock 1500 ft. in height springing out of the forest-clad slopes below the summit, and was considered inaccessible until in December 1886 Messrs. Thurn and Perkins forced their way to the top and succeeded in reaching a table-land some 12 sq. m. in area. Mt. Kukenam is of a similar structure and also rises above 8000 ft. Other conspicuous summits (about 7000 ft.) are Iwarikaimar, Elwaruna, Hutupi and Kukatuma, the highest of which are joined together by a band of conglomerate hills. A table-land some 200 sq. m. in area. From this great height (nearly 2000 ft. sheer at Roraima and Kukenam) the sandstone formation can be traced from the northern Piaracaima range on the N.W. to the Corentyne in the S.E. It is traversed in places by dikes and sills of diabase and dolerite, while bosses of more or less altered gabro rise through it. The surface of a large part of the colony is composed of gneiss and of quartzites, the sandstones and gneiss of the river beds being composed of quartz-porphyry, porphyrites and felsite, and of more or less chisstone rocks derived from them. These rocks are closely connected with the gneissose granites and gneiss, and there are reasons for believing that the latter are the deep-seated portions of them and are only visible where they have been exposed by denudation. Long ranges of hills, varying in elevation from a few hundreds to from 2000 ft. to 3000 ft., traverse the plains of the gneissose districts. These ranges are in the Moron Mts. and Merumurú Mts., which have undergone modifications, or by later ones of dolerite. These ranges are of great importance, as the rocks comprising them are the main source of gold in British Guiana.

The climate of British Guiana is said to be the best in the world, being physical and geographical conditions favoring health and comfort. It is free from frost and snow, has little or no rain in the summer, and is very little affected by the wind. The temperature is uniform throughout the year, the variation being very slight. The nights of the month are generally cooler than the days, but the temperature is still high, and the climate is oppressive. The humidity is very high, and the air is filled with the moisture of the sea. The vegetation is luxuriant, and the moisture of the sea is reflected in the profuse growth of the vegetation. The climate is healthy, and the inhabitants are in general in good health. The climate is also favorable to the growth of the fruits and vegetables, and the farmer can get much good from his crops. The climate of British Guiana is the best in the world, and it is a great advantage to have such a climate.
GUIANA

frequently down on the coast, attracted from the forest by the cattle grazing on the front and back pasture lands of the estates. Among the birds may be mentioned the caracara (an invaluable vole-vixen), victualling, ploup, or king, the ubiquitous kiskadee or guê est que die, a species of shrike—his name derived from his shrill call—the canary and the twa-twa, both charming whistlers. These familiar figures are now a strong and indigenous species in the flora and fauna of the British Guiana. No doubt the cause is partly due to the fatiguing heat and the sunny weather, but it is largely due to the protection afforded by the British Guiana.

On the coast the trenches and canals are full of alligators, but the great caiman is found only in the rivers of the interior. Among the many varieties of snakes are huge constricting camouyous, deadly basilisks, rhodobates, and rattle-snakes. Among other reptiles are the two large lizards, the salampana (an active enemy of the barn-door fowl), and the iguana, whose flesh when cooked resembles tender chicken. The Title of the Court of Policy and the financial representatives are elected by their several constituencies for five years. Qualification for the Court is the ownership, or possession under lease for a term of twenty-one years, of eighty acres of land, of which at least forty acres are under cultivation, or of house property to the value of $750. A financial representative must be similarly qualified or be in receipt of a clear income of not less than $300 per annum. Every male is entitled to be registered as a voter who (in addition to the usual formal qualifications) owns (during six months prior to registration) three acres of land in cultivation or a house of the annual rental or value of $50; or is a secured tenant for not less than three years of six acres of land in cultivation or for one year of a house of £20 rental; or has an income of not less than £100 per annum; or has during the previous twelve months paid £4, 3s. 4d. in direct taxation. Residence in the electoral district for six months prior to registration is coupled with the last two alternative qualifications. Plural voting is legal but plumping is allowed. The combined court is by this constitution, which was granted in 1891, allowed the group of all societies of the Court of Policy to form a civil list, voted for a term now fixed at three years. English is the official and common language. The Roman-Dutch law, modified by orders-in-council and local statutes, governs actions in the civil courts, but the criminal law is based on that of England. Magistrates have in civil cases jurisdiction up to £20, while an appeal lies from their decisions in any criminal or civil case. The supreme court consists of a chief justice and two puisne judges, and has various jurisdictions. The full court, consisting of the three judges or any two of them, has jurisdiction over all civil matters, but an appeal lies to His Majesty in privy council in cases involving £500 and upwards. A single judge sits in insolvency, in actions involving not over £500, and in appeals from magistrates' decisions. The appeal full court, consisting of three judges, sits to hear appeals from decisions of a single judge in the limited civil, appellate and insolvent courts. Criminal courts are held four times a year in each county, a single judge presiding in each court. A court of crown cases reserved is formed by the three judges, of whom two form a quorum provided the chief-justice is one of the two. There are no imperial troops stationed in British Guiana, but there is a semi-military police force, a small militia and two companies of volunteers. The Church of England and the Church of Scotland are both established, and grants-in-aid are also given to the Roman Catholic and Wesleyan churches and to several other denominations.

The revenue and expenditure now each amount annually to an average of £42,000, little over £25,000 being produced by import duties, and about £15,000 by excise. The public debt on the 31st of March 1905 stood at £589,620.

The system of primary education is entirely maintained by the government. During 1904-1905, 213 schools received grants-in-aid amounting to £23,500, the average cost per scholar being a little over £1. These grants are calculated on the basis of denominational annual returns. The official term April 1st to September 30th. to 1st. old. being made for each pass in reading, writing, arithmetic, school-garden work, nature study, singing and drill, English, geography, elementary hygiene and sewing. Secondary education is provided for girls at Queen's College, and for boys at Queen's College, an unrendominational government institution where the course of instruction is the same as at a public worldly institution, and candidates for the London and University local examinations, on the result of which annually depend the Guiana scholarship—open to boys and girls, and carrying a university or professional training in England—and two scholarships at Queen's College.

Industries and Trade.—At the end of the third decade of the 19th century the principal exports were sugar, rum, molasses, cotton and coffee. In 1830, 9,500,000 lb of coffee were sent abroad, besides 5,000,000 lb of rice, and all the British Guiana was not then being cultivated. The average amount now produced is less, but the sugar, the wine, the molasses and the rum are all largely increased. The large amount of rice produced, however, is not all consumed in the colony, but is largely sold on the market in the United States and European countries. The rice is grown chiefly on the east coast, and the chief centers of production are in the districts of Demerara and Essequibo. The staple industry of the colony is sugar, and the majority of the population are engaged in the production of this article. The sugar is made from molasses, and is a staple product of the colony. The average amount of sugar produced in the United States is 10,000,000 lb, and the average amount of the product in British Guiana is 5,000,000 lb.

flats. In the Puruni river. (a tributary of the Mazaruni) American capitalists, in consequence, have been encouraged to extend their operations, and have built a road from the sea to the waters of the Essequibo river. The principal gold districts are on the Essequibo and its tributaries—the chief being the Cuyuni, Mazaruni, Potaro and Conafarook—and on the Barima, Barima and Waini rivers. This route has been smaller workings, mostly unsuccessful, in the Demerara and Berbice rivers.

Diamonds and other precious stones have been found in small quantities on the Cuyuni and Berbice rivers, and on the Berbice river opposite New Amsterdam; they have been cut, by the latter tribesmen, and sold in the Demerara market. There are no records of the exact number of the gold and precious stones sold in 1860, 1868 and 1887, and regulations in 1899, were codified in 1902 and amended in 1905.

Timber is cut, and balata and rubber are to the forebears of the Demerara and Berbice rivers, and are limited to those parts of the forest which are close to the lower stretches of the rivers and creeks, the overland haulage of the heavy logs being both difficult and costly, while transport through the upper course of the rivers is impossible, owing to the cutting of the rapids and rapids. The average annual value of imports is £4,000,000, of which about two-thirds are from Great Britain and British possessions. Of the vessels trading with the colony, most of the vessels are between 100 and 200 tons; the remainder being principally American and Norwegian.

The money of account is dollars and cents, but, with the exception of the notes of the two local banks, the currency is British. The unit of land measure is the Rhenish acre, roughly equal to 12 ft. 4 in. A Rhenish acre contains 300 square rods.

Inland Communication. &c. — The public roads extend along the coast for about 150 miles, and along the Berbice river to some 20 m. N. of the Essequibo mouth on the Arorabiscia coast, and for a short distance up each of the principal rivers and creeks entering the sea between these points. A line of railway 60 m. in length runs from Georgetown to Rosignol on the left bank of the Berbice river opposite New Amsterdam; and another line 15 m. long starts from Vreed-en-ooop, on the left bank of the Demerara river opposite Georgetown, and runs to Greenwich Park on the right bank of the Essequibo river, some 30 m. from its mouth. A light railway, metre gauge, 18½ m. in length, connects Wismar (on the left bank of the Demerara river some 70 m. from its mouth) with Rockstone (on the right bank of the Essequibo and its tributaries) and another to Mr. Smith, on the left bank of the Berbice river opposite New Amsterdam. Steamers run daily to and from Georgetown and Wismar, and launchees to and from Rockstone and Tumatamari Fall on the Potaro, and all expeditions for the goldfields of the Essequibo and its tributaries start from this river mouth. The steamer goes twice a week to Bartica at the confluence of the Essequibo and Mazaruni, and another to Mr. Everard on the Berbice river, which from whither many expeditions start to the other gold and diamond fields. Steamers also run to Georgetown from New Amsterdam and up the Berbice river for about 100 m. The termini of these steamer routes all travelling is done in keeping boats, and the passengers and gear are conveyed between the rapids at both bow and stern by certificated bowmen and steerers. Owing to the extreme dangers of this inland travelling, stringent regulations have been fixed, and the supply of ropes and qualifications of men in charge, and the shooting of certain falls is prohibited. Voyages up-country are of necessity slow, but the return journey is made with comparatively great rapidity, distances laboriously covered on the up-trip in three days being done easily in seven hours when coming back.

From England British Guiana is reached in sixteen days by the steamers of the Royal Mail Steam Packet Company, and in nineteen days by the line from New York. There are regular services from Canada, the United States, France and Holland.

History. — When taken over in 1830 the prospects of British colonies were by no means promising, and during the next decade the situation became very critical. Owing to the increased output of sugar by conquered Dutch and French colonies the English market was glutted and the markets of the continent of Europe were not available, Bonaparte having closed the latter to British goods. The sugar industry was consequently disastrous, especially to those engaged in the manufacture of sugar, and at a public meeting held in Georgetown early in the latter year it was stated that the produce of the colony ordinarily worth £1,800,000 had on account of deteriorated value decreased by fully one-third. At this meeting it was resolved to petition the imperial parliament to allow the interchange of produce with the United States; a resolution which was unfortunately rendered abortive by the outbreak of war between England and the States in 1812, the trade of British Guiana being instead actually reduced by the embargo laid by the United States.

In 1810 Mr. C. J. C. D'Urban was succeeded by Martin, who had been governor of Berbice and Demerara. The following year he moved to the Combined Court on the 20th of October 1812 the governor (General Carneval) stated that a vessel with government stores had been captured by an American privateer, and in February 1813 the imperial government sent H.M.S. "Peacock" to protect the coast. On the 23rd of that month in cruising along the coast of Demerara the "Peacock" met the American privateer "Hornet," and though, after a gallant struggle, in which Captain Peake, R.N., was killed, the English ship was sunk with nearly all her crew, the colony did not suffer from any further depredations. In the following year the agitation in England in favour of emancipation gradually became known to the slaves and caused considerable unrest among them, culminating in 1813 in a serious outbreak on the estates on the east coast of Demerara. Negroes, demanding their freedom, attacked the houses of several managers, and although at most points these attacks were repulsed with little loss on either side, the situation was so serious as to necessitate the calling out of the military. The ring leaders were arrested and promptly and vigorously dealt with, while a special commission was appointed to try them. In 1813 Mr. Smith, a member of the London Missionary Society, who it was alleged had fostered the rising by his teachings to the slave congregation at his chapel in Le Ressouvin, this trial was stigmatized as unfair by the missionary party in England, but on the whole appears to have been conducted decently by an undoubtedly unbiased court. It is difficult now to form any very definite conclusion. Mr. Smith certainly had great influence over the slaves, and while his teaching prior to the outbreak was at least ill-advised, he made no efforts while the disturbances were going on to use his influence on the side of law and order; indeed all he could set his own defence was that he was ignorant of what was going on, a statement it is impossible to believe to have been strictly veracious. He was found guilty and sentenced to be hanged. It is obvious that he was never intended to carry out this sentence, and on the 20th of November the governor announced that he felt it imperative on him to transmit the findings of the court for His Majesty’s consideration. The question of Smith’s guilt or innocence created a great deal of feeling in England, the anti-slavery and missionary societies making it a basis for increased agitation in favour of the slaves; but the left bank of the Berbice river opposite New Amsterdam, and another weekly to Mr. Everard on the Berbice river. These lines had been opened after considerable expense, and the company was making a profit of £2000 per annum. In 1824 Mr. Smith had died in the city jail on the 6th of February of a pulmonary complaint from which he had been suffering for some time.
might have been obviated had he lived longer. He died at Camp House on the 4th of March 1838.

In the years following emancipation the colony was in a serious condition. The report of a commission in 1830 proved that it was virtually ruined, and only by the introduction of immigrants to provide a reliable labour supply were the sugar estates saved from total extinction. By 1833 the colony had begun to make headway, and Sir Henry Barkly, the then governor, was able to state in his speech to the Combined Court in January that its progress was in every way satisfactory. During Governor Barkly's administration the long series of struggles between the legislature and the executive terminated, and when he left in May 1833 he did so with the respect and good-will of all classes. The strengthening of the labour supply was not effected without troubles. In 1847 the negroes in Berbice attacked the persons and property of the Portuguese immigrants, the riots spreading to Demerara and Essequibo, and not until the military were called out were the disturbances quelled. Similar riots in 1842 were only stopped by the prompt and firm action of the new governor, Mr. (afterwards Sir) Francis Hincks, while rows between negroes and Chinese and negroes and East Indians were frequent. Gradually, however, things quieted down, and until 1883 the estates as a whole did well. In 1884 the price of sugar fell so seriously as to make the prospects of the colony very gloomy, and for nearly two decades proprietors had to be content with a price kept artificially low by bounty-fed beet-sugar, many estates being ruined, while those that survived only did so by the application of every economy, and by their owners availing themselves of every new discovery in the sciences of cultivation and manufacture.

The year 1889 was marked by an outbreak on the part of a section of the negro population in Georgetown directed against the Portuguese residents there. A Portuguese had murdered his black paramour and had been convicted and sentenced to death. The governor commuted the sentence to penal servitude for life. Shortly after this a Portuguese stall-holder in the market assaulted a small black boy whom he suspected of pilfering, the latter having to be taken to a hospital, while the former, after being taken to a police station, was, through some misunderstanding or informality, at once released. Almost immediately excitable and unreasoning negroes were rushing about loudly proclaiming that the boy was dead, that the Portuguese were allowed to kill black people and to go free, and calling on another to take their own revenge. Mobs gathered quickly, attacked individual Portuguese and wrecked their shops and houses, and not until the city had been given up for two days to scenes of disgraceful disorder were the efforts of the police and special constables successful in quelling the disturbances. The damage done amounted to several thousands of dollars, the Portuguese owners being eventually compensated from general revenue.

In 1884 the dispute as to the boundary with Venezuela became acute. It was reported to the colonial government that the government of Venezuela had granted to an American syndicate a concession which covered much of the territory claimed by Great Britain, and although prompt investigation by an agent despatched by the governor did not then disclose any trace of interference with British claims, a further visit in January 1885, made in consequence of reports that servants of the Mano Company had torn down notices posted by Mr. McCurk on his former visit, discovered that the British notices had been covered over by Venezuelan ones and resulted in the government of Great Britain declaring that it would thenceforward exercise jurisdiction up to and within a boundary known as "the modified Schomburgk line." Outposts were located at points on this line, and for some years Guianan police and Venezuelan soldiers faced one another across the Amacura creek in the Orinoco mouth and at Yuruan up the Cuyuni river. Guianan officers, however, presumably instructed not actively to oppose acts of aggression by the Venezuelan government, for in January 1895 Venezuelan soldiers arrested Messrs. D. D. Barnes and A. H. Baker, inspectors of police in charge at Yuruan station, conveyed them through Venezuela to Caracas, eventually allowing them to take steamer to Trinidad. For this act compensation was demanded and was eventually paid by Venezuela. The diplomatic question as to the boundary—the results of which are stated above—was passed out of the hands of the colony; see the account of the arbitration under VENEZUELA. The last two months of 1903 were marked by serious disturbances in Georgetown, and in a lesser degree on the east coast, particularly at the mouths of the Demerara river. On the 29th of November the dock-labourers and the native porters there being struck for higher wages, and large crowds invaded the principal stores in the city, compelling men willing to work to desist and in some cases assaulting those who opposed them. By the evening of the 30th of November they had got so far out of hand as to necessitate the reading of the Riot Act and a proclamation by the governor (Sir F. M. Hodgson) forbidding all assemblies. On the morning of the 1st of December serious disturbances broke out at Kuimvet, a sugar estate directly south of Georgetown, where the cane-cutters had suddenly entirely withdrawn from work for higher pay, and the police were compelled to fire on the mob, killing some and wounding others. All through that day mobs in all parts of the city assaulted any white man they met, houses were invaded and windows smashed, and on two further occasions the police had to fire. At night torrential rains forced the rioters to shelter, and enabled the police to get rest, their places being taken by pickets of militiamen and special constables. On Saturday, the 2nd of December, the police had got the upper hand, and the agreement that night of H.M.S. "Sappho" and on Sunday of H.M.S. "Diamond" gave the government complete control of the situation. Threatened troubles on the sugar estates on the west bank were suppressed by the prompt action of the governor, and the arrest of large numbers of the rioters and their immediate trial by special courts restored thorough order.

II. DUTCH GUIANA, or SURINAM, has an area of about 57,900 sq. m. British Guiana bounds it on the west and French on the east (the long unsettled question of the French boundary is dealt with in section III., FRENCH GIANA). The various peoples inhabiting Surinam are distributed according to the soil and the products. The Indians (Caribs, Arawaks, Warraws) live on the savannahs, or on the upper Nickerie, Coppena and Maroni, far from the plantations, cultivating their fields of manioc or cassava, and for the rest living by fishing and hunting. They number about 2000. The bush negroes (Marrons) dwell between 3° and 4° N., near the isles and cataracts. They are estimated at 10,000, and are employed in the transport of men and goods to the goldfields, the navigation of the river between the Indians, and in the transport of wood to Paramaribo and the plantations. They are the descendants of runaway slaves, and before missionaries had worked among them their paganism retained curious traces of their former connexion with Christianity. Their chief god was Gran Gado (grand-god), his wife Maria, and his son Jesi Kist. Various minor deities were also worshiped, Ampuka the bush-god, Tonl the water-god, &c. Their language was based on a bastard English, mingled with many Dutch, Portuguese and native elements. Their chiefs are called grannen or grand man; but the authority of these men, and the peculiarities of language and religion, have, in great measure died out owing to modern intercourse with the Dutch and others. The inhabitants of Paramaribo and the plantations comprise a variety
of races, represented by Chinese, Javanese, coolies from India and the West Indies, negroes and about 2000 whites. Of non-Christian immigrants there are about 6000 Mahommeds and 12,000 Hindus; and Jews number about 1200. The total population was given in 1907 as 84,103, exclusive of Indians, &c., in the forests. Nearly one-half of this total are in Paramaribo and one-half in the districts. The population has a tendency to move from the districts to the town; thus in 1852 there were 6000 persons in the town and 32,000 in the districts.

The principal settlements have been made in the lower valley of the Surinam, or between that river and the Saramacca on the W. and the Commewyne on the E. The Surinam is the chief of a number of large rivers which rise in the Tumuc Humac range or the low hills between it and the sea, which they enter on the Dutch seaboard, between the Corentyne and the Maroni (Dutch Corantijn en Marowijne), which form the boundaries with British and French territories respectively. Between the rivers of Dutch Guiana there are remarkable cross channels available during the floods at least. As the Maroni communicates with the Cottica, which is in turn a tributary of the Commewyne, so that from the latter it is possible to reach the Corentyne by the Sommelsdijk canal it can reach the Saramacca, and from the Saramacca it can proceed up the Coppename, and by means of the Nickerie find its way to the Corentyne. The rivers are not navigable inland to any considerable extent, as their courses are interrupted by rapids. The interior of the country consists for the most part of low hills, though an extreme height of 380 ft. is known in the Wilhelmina Kette, in the west of the colony, about 3° 50' to 4° N. The hinterland south of this latitude, and that part of the Tumuc Humac range along which the Dutch frontier runs, are, however, practically unexplored. Like the other territories of Guiana the Dutch colony is divided physically into a low coast-land, savannahs and almost impenetrable forest.

Meteorological observations have been carried on at five stations (Paramaribo, Coronie, Sommelsdijk, Nieuw-Nickerie and Groningen). The mean range of temperature for the day, month and year shows little variation, being respectively 77-54° to 38-5° F., 76-1°-75-6° F. and 75-2°-90-14° F.

The north-east trade winds prevail throughout the year, but the rainfall varies considerably; for December and January the mean is respectively 8-58 and 9-57 in., for May and June 11-26 and 10-31 in., but for February and March 7-2 and 6-81 in., and for September 2-48 and 2-9 in. The seasons comprise a long and a short dry season, and a period of heavy and of slight rainfall.

**Products and Trade.**—It has been found exceedingly difficult to exploit the productive black soils. The most important crops and those supplying the chief exports are cocoa, coffee and sugar, all cultivated on the larger plantations, with rice, maize and bananas on the smaller or coast lands. Most of the larger plantations are situated on the lower courses of the Surinam, Commewyne, Nickerie and Cottica, and on the coast lands, rarely in the upper parts. Goldfields lie in the older rocks (especially the slate) of the upper Surinam, Saramacca and Maroni. The first section of a railway designed to connect the goldfields with Paramaribo was opened in 1906. The annual production of gold amounts in value to about $100,000, but has shown considerable fluctuation. Agriculture is the least developed of the resources. Among the crops which are not yet cultivated, 50,000 persons whose occupation is given in official statistics, close upon 21,000 are engaged in agriculture or on the plantations, 2400 in gold-mining and only 1000 in trade. The exports increased in value from $200,800 in 1875 to $490,800 in 1899, and imports from $260,450 in 1875 to $510,180 in 1899; but the average value of exports over five years subsequently was only $468,550, while in 1899 it was $533,000.

**Administration.**—The colony is under a governor, who is president of an executive council, which also includes a vice-president and three members nominated by the crown. The legislative body is the council of state, which consists of 16 members, of whom there is one for every 200 holders of the franchise. The colony is divided into sixteen districts. For the administration of justice there are three cantonal courts, two district courts, and the supreme court at Paramaribo, which is court of last resort and in which all the members are nominated by the crown. The average local revenue (1901-1906) was about $276,000 and the expenditure about $317,000; both fluctuated considerably, and a varying subvention is necessary from the home government ($16,000 in 1902, $60,400 in 1906; the annual average is about $167,000. There are a civic guard of about 1800 men and a militia of 500, with a small garrison.

**History.**—The history of the Dutch in Guiana, and the compression of their influence within its present limits, belongs to the general history of Guiana (above). Surinam and the Dutch islands of the West Indies were placed under a common government in 1828, the governor residing at Paramaribo, but in 1834 they were separated. Slavery was abolished in 1863. Labour then became difficult to obtain, and in 1870 a convention was entered between Holland and England for the regulation of the coolie traffic, and a Dutch government agent for Surinam was appointed at Calcutta. The problem was never satisfactorily solved, but the interest of the mother-country in the colony greatly increased during the last twenty years of the 19th century, as shown by the establishment of the Surinam Association, of the Steam Navigation Company's service to Paramaribo, and by the formation of a botanical garden for experimental culture at that town, as also by geological and other scientific expeditions, and the exhibition at Haarlem in 1897.

**BIBLIOGRAPHY.**—Work on Surinam the first rank is held by Jan Jacob Hartsinck's "Oud en Nieuw Guiana, of de Wilde Kust, in Zuid Amerika" (2 vols., Amsterdam, 1770). Extracts from this work, selected for their bearing upon British intermediary questions, were translated and annotated by J. A. J. de Villiers (London, 1897). A valuable "Geschiedenis der Kolonie van Suriname," by a "learned Jew," was published (Amsterdam in 1791); and it was supplemented and far superseded by Wolter van Lennep's "Beschrijving van Suriname" (Amsterdam, 1861). See further W. G. Palgrave, "Dutch Guiana" (London, 1876); A. Kappler, "Surinam, sein Land, &c." (Stuttgart, 1887); Prince Roland Bonaparte, "Les Habitudes de Surinam" (Paris, 1884); K. **III. French Guiana (Guyane).**—This colony is situated between Dutch Guiana and Brazil. A delimitation of the territory belonging to France and the Netherlands was arrived at in 1891 by decision of the emperor of Russia. This question originated in the arrangement of 1856, that the river Maroni should form the frontier. It turned on the claim of the Awa or the Tapanahoni to be recognized as the main head-stream of the Maroni, and the final decision, in indicating the Awa, favoured the Dutch. In 1905 certain territory lying between the upper Maroni and the Itany, the possession of which had not then been settled, was acquired by France by agreement between the French and Dutch governments. The question of the exploitation of gold in the Maroni was settled by attributing alternate reaches of the river to France and Holland; while France obtained the principal islands in the lower Maroni. The additional territory thus attached to the French colony amounted to 965 sq. m. In December 1900 the Swiss government as arbitrators fixed the boundary between French Guiana and Brazil as the river Oyapock and the watershed on the Tumuc Humac range. By an agreement of France about 3000 of the 100,000 sq. m. which she claimed. This dispute was of earlier origin than that with the Dutch; dissensions between the French and the Portuguese relative to territory north of the Amazon occurred in the 17th century. In 1700 the Treaty of Lisbon made the contested area (known as the Terres du Cap du Nord) neutral ground. The treaty of Utrecht in 1713 indicated as the French boundary a river which the French afterwards claimed to be the Araguay, but the Portuguese asserted that the Oyapock was intended. After
Brazil had become independent the question dragged on until in 1890–1895 there were collisions in the contested territory between French and Brazilian adventurers. This compelled serious action, and a treaty of arbitration, preliminary to the settlement, was signed at Rio de Janeiro in 1897. French Guiana, according to official estimate, has an area of about 51,000 sq. m. The population is estimated at about 50,000; its movement is not rapid. Of this total, 2,352,900 are Indians. Since 1839 they have been joined by the negroes from the French Congo, who have formed the penal population, 1,500 were native Índias (Galibi, Emerillon, Oyamp) and 900 near Maroni were negroes. Apart from Cayenne, which was rebuilt after the great fire of 1888, the centres of population are unimportant: Sinnamary with 1,500 inhabitants, Mana with 1750, Roseau with 1,200 and Approuague with 1,150. In 1892 French Guiana was divided into fourteen communes, exclusive of the Maroni district. Belonging to the colony are also the three Safety Islands (Royale, Joseph and Du Diable—the last notable as the island where Captain Dreyfus was imprisoned), the Enfant Perdu Island and the live Remire Islands.

A considerable portion of the low coast land is occupied by marshes, with a dense growth of mangroves or, in the drier parts, with dense growth of flax. The interior, on the other hand, is confined almost entirely to the littoral and alluvial districts. The forest-clad hills of the hinterland do not generally exceed 1500 ft. in altitude, and the highest point, the Pueblito, which is 2800 ft. above sea level. The southern frontier may reach an extreme elevation of 2600 ft. But the dense tropical forests attract so much moisture from the ocean winds that the highlands are the birthplace of a large number of rivers, which are navigable as far as Port Mana following which are 60 to 70 ft. deep. Not less than 15 are counted between the Maroni and the Oyapock. South-eastward from the Maroni the first important is the Mana, which is navigable for large vessels 10 m. from its mouth, and for smaller vessels 27 m. farther. Passing the Sinnamary and the Kouro, the Oyapock is next reached, near the mouth of which is Cayenne, the capital of the colony, and thereafter the Approuague. All these rivers take their rise in a somewhat elevated area about the middle of the colony; those streams which rise farther south, in the Tumuc Humac hills, are tributaries of the two frontier rivers, the Maroni on the one hand or the Oyapock on the other.

The rainy season begins in November or December, and lasts till the latter part of June; but there are usually three or four weeks of good weather in March. During the rest of the year there is often hardly a drop of rain for months, but the air is always very moist. At Cayenne the average annual rainfall amounts to fully 130 in., and it is naturally heavier in the interior. During the hotter part of the year—August, September, October—the temperature is so high that it is almost impossible to open the windows. In the colder season the mean is 70°; in the rainy season it exceeds 85°; in the middle season the mean is 90° and it seldom sinks so low as 70°. Between day and night there is very little thermometric difference. The prevailing winds are the NE., which blow off the continent, and the NW., which come from the N.E. During the rainy season the winds keep between N. and E., and during the dry season between S. and E. Hurricanes are unknown. In flora and fauna the colony resembles the Brazilian colony. Vegetation is excessively rich. Among leguminous trees, which are abundantly represented, the wacapu is the finest of many hard-wood trees. Caoutchouc and various palms are also common. The manioc is a principal source of food; rice is an important object of cultivation; and maize, yams, arrowroot, bananas and the breadfruit are also to be mentioned. Vanilla is one of the common wild plants of the country. The clove tree has been acclimatized, and in the latter years of the empire it formed a good source of wealth; the cinnamon tree was also successfully introduced in 1772, but like that of the pepper-tree and the nutmeg its cultivation is not at all successful. The colony is very rich in the productions of the soil either cultivated or wild, and has been largely devoted to agriculture, although France has paid some attention to the development of this branch of activity. In 1880 a colonial garden was created near Cayenne; since 1894, an experimental garden has been laid out at Baduel. About 8200 acres are cultivated, of which 5400 acres are under cereals and rice, the remaining being under coffee (introduced in 1716), cacao, cane, and other cultures. The low lands between Cayenne and Oyapock are capable of bearing colonial produce, and the savannahs might support large herds; cereals, root-crops and vegetables might easily be grown on the high grounds, and timber working in the interior should be profitable.

Gold-mining is the most important industry in the colony. Placers of great wealth have been discovered on the Awa, on the Ducot, and at Cassenge; besides more than 400 claims are subject of the Franco-Brazilian dispute. But wages are high and transport is costly, and the amount of gold declared at Cayenne did not average more than 130,550.00 annually in 1909–1905. Silver and iron have been found in various districts; kaolin is extracted in the plains of Montsinéry; and phosphates have been discovered at several places. Besides gold-workings, the industrial establishments comprise saw-mills, distilleries, brick-works and sugar-works.

Trade and Communications.—The commerce in 1885 amounted to £336,000 for imports and to £14,400 for exports; in 1897 the values were respectively £73,350 and £286,400, but in 1903, while imports had not increased, the estimated expenditure on the penal settlement, to £493,213. The imports consist of wines, flour, clothes, &c.; the chief are gold, phosphates, timber, cocoa and rosewood essence. The quantity of the drawbacks to the development of the colony is the lack of labor. The means of transportation is most difficult to obtain, and attempts to utilize convict labour have not proved very successful. Efforts to supply the need by immigration have hitherto been unsuccessful. The indications are that in regard with the Safety Islands (35 m.), and the mouth of the Maroni (80 m.), with Fort de France in the island of Martinique, where travellers meet the mail packet for France, and with Boston (U.S.A.). There is a French cable between Cayenne and Brest.

Administration.—The colony is administered by a commissioner-general assisted by a privy council, including the secretary general and chief of the judicial service, the military, penitentiary and administrative departments. In 1879 an elective general council was constituted of 15 members elected annually by the inhabitants for instance and a higher tribunal at Cayenne, besides four justices of peace, one of whom has extensive jurisdiction in other places. Of the £250,000 demanded for the colony in the colonial budget for the year 1894, only £110,000 was actually spent on the penal settlement, so that the cost of the colony was only about £21,000. The local budget for 1901 balanced £99,000 and in 1905 at £116,450. The Compagnie de la Couronne, sent in the coloch from 1824 to 1894, becomes a member of the French government, and the chief penal settlement in the French colonies. In 1885–1886 French Guiana was included as a place of settlement for confirmed criminals and for convicts sentenced to more than eight years' hard labour. A large proportion of these men have been found unfit for employment under public works.

History.—The Sieur La Revardière, sent out in 1645 by Henry IV. to reconnoitre the country, brought back a favourable report; but the death of the king put a stop to the projects of formal colonization. In 1626 a small body of traders from Rouen settled on the Sinnamary, and in 1635 a similar band founded Cayenne. The Compagnie du Cap Nord, founded by the people of Rouen in 1634 and conducted by Foncette de Brétigny, the Compagnie de la France Équinoxiale, established in 1645, and the second Compagnie de la France Olympe, founded 1641, were all amalgamated in 1658, and the French possessions, established in 1652, were failures, the result of incompetence, mismanagement and misfortune. From 1654 the Dutch held the colony for a few years. The French Compagnie des Indes Occidentales, chartered in 1664 with a monopoly of Guiana commerce for forty years, proved hardly more successful than its predecessors; but in 1674 the colony passed under the direct control of the crown, and the able administration of Colbert began to tell favourably on its progress, although in 1686 an unsuccessful expedition against the Dutch took place. The advance of the French colony until the close of the century.

The year 1763 was marked by a terrible disaster. Choiseul, the prime minister, having obtained for himself and his cousin Praslin a concession of the country between the Kouro and the Maroni, sent out about 12,000 volunteer colonists, mainly from Alsace and Lorraine. They were landed at the mouth of the Kouro, where no preparation had been made for their reception, and where even water was not to be obtained. Mismanagement was complete; there was (for example) a shop for skates, whereas the nearest tools for digging were on the ring. By 1765 no more than 918 colonists remained alive, and these were a famished fever-stricken band. A long investigation in Paris resulted in the imprisonment of the incompetent leaders of the expedition. Several minor attempts at colonization in Guiana were made in the latter part of the century; but they
all seemed to suffer from the same fatal prestige of failure. During the revolution band after band of political prisoners were transported to Guiana. The fate of the royalists, nearly 600 in number, who were exiled on the 18th Fructidor (1797), was especially sad. Landed on the Sannatary without shelter or food, two-thirds of them perished miserably. In 1820 Victor Hugo was appointed governor, and he managed to put the colony in a better state; but in 1809 his work was brought to a close by the invasion of the Portuguese and British. Though French Guiana was nominally restored to the French in 1814, it was not really surrendered by the Portuguese till 1817. Numerous efforts were now made to establish the colony firmly, although its past misfortunes had prejudiced the public mind in France against it. In 1822 the first steam sugar mills were introduced; in 1824 an agricultural colony (Nouvelle Angoulême) was attempted in the Mana district, which, after failure at first, became comparatively successful. The emancipation of slaves and the consequent dearth of labour almost ruined the development of agricultural resources about the middle of the century, but in 1833 a large body of African immigrants was introduced. The discovery of gold on the Approuague in 1835 caused feverish excitement, and seriously disturbed the economic condition of the country.

AUTHORITIES.—A detailed bibliography of French Guiana will be found in Terraux-Compan, Notice historique de la Guyanne française (1878), p. 182, where more recent books are also cited. See also: Baudet, Notice sur la Guyane, issued on the occasion of the Paris Exhibition (1900); Publications de la société d'études pour la colonisation de la Guyane française (Paris, 1878); H. Reclus, La France Equatoriale (1878), Dialectes indiens de Guyane (1891), Dix ans de Guyane (1892), and Chos nos Indiens (1893), all at Paris; G. Broussseau, Les Richesses de la Guyanne française (Paris, 1901); L. F. Viau, Les Trois Guianes (Montpellier, 1853).

GUIARD, or GUIBERT, GUILLAUME (d. c. 1316), French chronicler and poet, was probably born at Orleans, and served in the French army in Flanders in 1304. Having been disabled by a wound he began to write, lived at Arras and then in Paris, thus being able to consult the large store of manuscripts in the abbey of St Denis, including the Grandes chroniques de France. Afterwards he appears as a ménestrel de boucher. Guiart's poem Branche des royaux lignages, was written and then rewritten between 1304 and 1307, in honour of the French king Philip IV., and in answer to the anonymous Lais d'une Flemish poet. Comprising over 21,000 verses it deals with the history of the French kings from the time of Louis VII but is only really important for the period after 1296 and for the war in Flanders from 1301 to 1304, of which it gives a graphic account, and for which it is a high authority. It was first published by J. A. Buchon (Paris, 1828), and again in tome xxii. of the Recueil des historiens des Gaules et de la France (Paris, 1865).

GUIBERT, or WIBERT (c. 1030-1100), of Ravenna, antipope under the title of Clement III. from the 23rd of June 1080 until September 1090, was born at Parma between 1025 and 1030 of the noble imperial family, Corregio. He entered the priesthood and was appointed by the empress Agnes, chancellor and, after the death of Pope Victor II. (1057), imperial vicar in Italy. He strove to uphold the imperial authority during Henry IV.'s minority, and presided over the synod at Basel (1061) which annulled the election of Alexander II. and created in the person of Cardinal Hildebrand, he obtained the archbishopric of Ravenna and swore fealty to Alexander II. and his successors. He seems to have been at first on friendly terms with Gregory VII., but soon quarrelled with him over the possession of the city of Imola, and henceforth was recognized as the soul of the imperial faction in the investiture contest. He allied himself with Cencius, Cardinal Candidus and other opponents of Gregory at Rome, and when in 1075, Pope Gregory VIII. attempted to attach the Lombard synod of 1075, he was ecclesiastically suspended by the pope. He was probably excommunicated at the synod of Worms (1076) with other Lombard bishops who sided with Henry IV., and at the Lenten synod of 1078 he was banned by name. The emperor, having been excommunicated for the second time in March 1080, convened nineteen bishops of his party at Mainz on the 31st of May, who pronounced the deposition of Gregory; and on the 25th of June he caused Guibert to be elected pope by thirty bishops assembled at Brixen. Guibert, whilst retaining possession of his archbishopric, accompanied his imperial master on the last of the latter's military expeditions. Having gained Rome, he was installed in the Lateran and afterward freely as Clement III. on the 24th of March 1084. One week later, on Easter Sunday, he crowned Henry IV. and Bertha in St Peter's. Clement survived not only Gregory VII. but also Victor III. and Urban II, maintaining his title to the end and in great measure his power over Rome and the adjoining regions. Excommunication was pronounced against him by all his rivals. He was driven out of Rome finally by crusaders in 1097, and sought refuge in various fortresses on his own estates. St Angelo, the last Guibertiad stronghold in Rome, fell to Urban II. on the 24th of August 1098. Clement, on the accession of Paschal II. in 1099, prepared to renew his struggle but was driven from Albano by Norman troops and died at Civita Castellana in September 1100. His ashes, which were said by his followers to have worked miracles, were thrown into the water by Paschal II.

GUIBERT (1053-1124), of Nogent, historian and theologian, was born of noble parents at Clermont-en-Beauvoisins, and dedicated from infancy to the church. He received his early education at the Benedictine abbey of Flavigny (Flavicum) or St Germer, where he studied with great zeal, devoting himself at first to the secular poets, an experience which left its imprint on his works; later changing to theology, through the influence of Anselm of Bec, afterwards archbishop of Canterbury. In 1104, he was chosen to be head of the abbey of Notre Dame de Nogent and henceforth took a prominent part in ecclesiastical affairs. His autobiography (De vita sua, sive monodiarum), written towards the close of his life, gives many picturesquely glimpses of his time and the customs of his country. The description of the commune of Laon is a historical document of the first order. The same local colour lends charm to his history of the first crusade (Gesta Dei per Francos) written about 1110. But the history is largely a paraphrase, in ornate style, of the Gesta Francorum of the anonymous Monogrammata (see Crusades); and when he comes to the end of his authority, it allows bolder and degenerates into an undigested heap of notes and anecdotes. At the same time his high birth and his position in the church gave his work an occasional value.

BIBLIOGRAPHY.—Guibert's works, edited by d'Achery, were first published in 1681, in 7 vol. folio, at Paris (Venerabilis Guibert Abbatis de Moraviae Opera omnia), and republished in Migne's Patrologia Latina, vols. cvi. and clxxiv. They include, besides minor works, a treatise on homiletics ("Liber quod ordinem homileticorum""); a book on "Deutero-Parados" begun in 1084, but not completed until 1116, composed on the model of Gregory the Great's Maria in Johone; five books of Tropologie on Hosea, Amos and the Lamentations; a treatise on the Incarnation, against the Jews; four books De pigmentibus sanctorum; and a commentary on the Bible. Regularly there is criticism on the abuses of clergy and religious life; three books of autobiography, De vita sua, sive monodiarum; and eight books of the Historia graeci qui per Francos, sive historia Hierosolimitana (the ninth book is by another author). The most important of all the works that have been repeated in the last of the names, in J. Bongars, Gesta Dei per Francos, i, and Recueil des historiens des croisades, hist. Occid., iv. 113-223. See also the encyclopaedia of Dr. Wattenbach. Regularly there are criticisms on the abuses of clergy and religious life; three books of autobiography, De vita sua, sive monodiarum; and eight books of the Historia graeci qui per Francos, sive historia Hierosolimitana (the ninth book is by another author). GUICCIARDINI

 Marshal de Broglie, throughout the war in Germany, and won the cross of St Louis and the rank of colonel in the expedition to Corsica (1767). In 1770 he published his Essai général de tactique in London, and this celebrated work appeared in numerous subsequent editions and in English, German and even Persian translations (extracts also in Liékenne and Savoyn, Histoire de la guerre de six ans, 1776). In 1772 he published a detailed critique of which see Max Jähn, Gesch. d. Kriegswissen-
schaften, vol. iii. pp. 2058-2070 and references therein) it may be said that it was the best essay on war produced by a soldier during a period in which tactics were discussed even in the salon and military literature was more abundant than at any time up to 1781. Apart from technical questions, in which Guibert's enlightened conservatism stands in marked contrast to the doctrinaire progressiveness of Menil Durand, Polari and others, the book is chiefly valued for its broad outlook on the state of Europe, especially of military Europe in the period 1768-1792. One quotation may be given as being a most remarkable prophecy of the impending revolution in the art of war, a revolution which the "advanced" tacticians themselves scarcely foresaw. "The standing armies, while a burden on the people, are inadequate for the achievement of great and decisive results in war, and meanwhile the mass of the people, untrained in arms, degenerates... The hegemony over Europe will fall to that nation which... becomes possessed of many virtues and creates a national army—a prediction fulfilled almost to the letter in the two following years of the French Revolution. In 1778, he visited Germany and was present at the Prussian regimental drills and army manoeuvres; Frederick the Great, recognizing Guibert's ability, showed great favour to the young colonel and freely discussed military questions with him. Guibert's Journal d'un voyage en Allemagne was published, with a memoir, by Touloncle (Paris, 1803). His Défense du système de guerre moderne, a reply to his many critics (Neuchâtel, 1770) is a reasoned and scientific defence of the Prussian method of tactics, which formed the basis of his work when in 1775 he began to co-operate with the count de St Germain in a series of much-needed and successful reforms in the French army. In 1777, however, St Germain fell into disgrace, and his fall involved that of Guibert who was promoted to the rank of maréchal de camp and relegated to a provincial staff appointment. In his semi-retirement he vigorously defended his old chief St Germain against his detractors. On the eve of the Revolution he was recalled to the War Office, but in his turn he became the object of attack and he died, practically of disappointment, on the 6th of May 1790. Other works of Guibert, besides those mention

ated are: Observations sur la constitution politique des armées de S. M. Prusse (Amsterdam, 1778), Études of Marshal Catani (1775), of Michel de l'Hôpital (1778), and of Frederick the Great (1787). Guibert was a member of the Academy from 1786, and he also wrote a tragedy, Le Connalable de Bourbon (1773) and a journal of travels in France and Switzerland.

See Touloncle, Éloge véridique de Guibert (Paris, 1799); Madame de Sacher, Éloge de Guibert; Bardin, Notice historique du général Guibert (Paris, 1836); Flavien d'Albeguey, Discours sur la vie et les écrits du comte de Guibert (Toulouse, 1855); Count Foresti, Biographie du comte de Guibert (Montauban, 1855); Count zur Lippe, Ketteler der Große und Oberst Guibert (Mittheil.-Wochenblatt, 1873, 9 and 10).

GUICCIARDINI, FRANCESCO (1483-1540), the celebrated Italian historian and statesman, was born at Florence in the year 1483, when Marsilio Ficino held him at the font of baptism. His family was illustrious and noble; and his ancestors for many generations had held the highest posts of honour in the state, as may be seen in his own genealogical Ricordi autobio-
grafici e di famiglia (Op. ined. vol. x.). After the usual educa-
tion of a boy in grammar and elementary classical studies, his father, Piero, sent him to the universities of Ferrara and Padua, where he stayed until the year 1505. The death of an uncle, who had occupied the see of Cortona with great pomp, induced the young Guicciardini to hank in an ecclesiastical career. He already saw the scarlet of a cardinal's hat; and to this eminence he would assuredly have risen. His father, how-
ever, checked this ambition, declaring that, though he had five sons, he would not suffer one of them to enter the church in its then state of corruption and debasement. Guicciardini, whose motives were confessedly ambitious (see Ricordi, Op. ined. x. 68), turned his attention to law, and at the age of twenty-three was appointed by the Signoria of Florence to read the Institutes in public. Shortly afterwards he engaged himself in marriage to Maria, daughter of Alamanno Salvati, prompted, as he frankly tells us, by the political support which an alliance with that great family would bring him (ib. x. 71). He was then practising at the bar, where he won so much distinction that the Signoria, in 1512, entrusted him with an embassy to the court of Ferdinand the Catholic. Thus he entered on the real work of his life as a diplomatist and statesman. His conduct upon that legation was afterwards severely criticized; for his political antagonists accused him of betraying the true interests of the commonwealth, and using his influence for the restoration of the exiled house of Medici to power. His Spanish correspond-
ence with the Signoria (Op. ined. vol. vi.) reveals the extra-
ordinary power of observation and analysis which was a chief quality of his mind; and in Ferdinand, hypocritical and pro-
dfoundly dissimulative, he found a proper object for his scientific study. To suppose that the young statesman learned his frigid statecraft in Spain would be perhaps too simple a solution of the problem offered by his character, and scarcely fair to the copious and remarkable memoirs of his life and conduct which he wrote, and which were published in (Op. ined. vols. vi., viii.). Still the school was pregnant with in-
structions for so apt a pupil. Guicciardini issued from this first trial of his skill with an assured reputation for diplomatic ability, as that was understood in Italy. To unravel plots and weave counterplots; to meet treachery with fraud; to parry force with sLEIGHTS OF HAND; TO CREDIT HUMAN NATURE WITH THE HAPPy MOTIVES, while the blackest crimes were contemplated with cold enthusiasm for their cleverness, was reckoned then the height of political sagacity. Guicciardini could play the game to perfection. In 1515 Leo X. took him into service, and made him governor of Reggio and Modena. In 1521 Parma was added to his rule, and in 1523 he was appointed viceroy of Romagna by Clement VII. These high offices rendered Guicciardini the virtual master of the papal states beyond the Apenines, during a period of great bewildering and difficulty. The copious and elementary political memoirs which he has composed and published (Op. ined. vols. viii.,) have been held higher rank as lieutenant-general of the papal army. While holding this commission, he had the humiliation of witnessing from a distance the sack of Rome and the imprisonment of Clement, without being able to rouse the peridious duke of Urbino into activity. The blame of Clement's downfall did not rest with him; for it was merely his duty to attend the camp, and keep his master informed of the proceedings of the generals (see the Correspondence, Op. ined. vols. iv., v.). Yet Guicciar-

dini's influence accounts for the attempts made in 1521 by the pope to declare war, as he notes in a curious letter to himself written in 1527 (Op. ined., x. 104). Clement did not, however, withdraw his confidence, and in 1531 Guicciardini was advanced to the governorship of Bologna, the most important of all the papal lord-lieutenancies (Correspondence, Op. ined. vol. ix.). This post he resigned in 1534 on the election of Paul III., preferring to follow the fortunes of the Medicean princes. It may here be noticed that though Guicciardini served three popes through a period of twenty years, or perhaps because of this, he hated the papacy with a deep and frozen bitterness, attributing the woes of Italy to the ambition of the church, and declaring he had seen enough of sacerdotal abominations to make him a Lutheran (see Op. ined. i. 27, 104, 96, and Ist. d' It., ed. Ros., ii. 218). The same discord between his private opinions and his public actions may be traced in his conduct subsequent to 1534. As a
GUICCIARDINI

political theorist, Guicciardini believed that the best form of government was a commonwealth administered upon the type of the Venetian constitution (Op. ined. i. 6; ii. 190 sq.); and we have ample evidence to prove that he had judged the tyranny of the Medici at its true worth (Op. ined. i. 171, on the tyrant; the whole Storia Fiorentina and Regimimento di Firenze, ib. i. and iii., on the Medici). Yet he did not hesitate to place his powers at the disposal of the most vicious members of that house for the endavancement of Florence. In 1527 he had been declared a rebel by the Signoria on account of his well-known Medicean prejudices; and in 1530, deputed by Clement to punish the citizens after their revolt, he revenged himself with a cruelty and an avarice that were long and bitterly remembered. When, therefore, he returned to inhabit Florence in 1534, he did so as the creature of the dissolute Alessandro de' Medici. Guicciardini pushed his servility so far as to defend this infamous despot at Naples in 1535, before the bar of Charles V., from the accusations brought against him by the Florentine exiles (Op. ined. vol. ix.). He won his cause; but in the eyes of all posterity he justified the reproaches of his contemporaries, who describe him as a cruel, venal, grasping seeker after power, eager to support a despotism for the sake of honours, offices and emoluments secured for himself by a bargain with the oppressors of his country. Varchi, Nardi, Jacopo Pitti and Bernardo Segni are unanimous upon this point; but it is only the recent publication of Guicciardini's private MSS. that has made us understand the force of their invectives. To please loyalty or honest political convictions in defence of his Medicean partisanship is now impossible, face to face with the opinions expressed in the Ricordi politici and the Storia Fiorentina. Like Machiavelli, but on a lower level, Guicciardini was willing to "roll stones," or to do any dirty work for masters whom, in the depth of his soul, he detested and despised. After the murder of Duke Alessandro in 1537, Guicciardini espoused the cause of Cosimo de' Medici, a boy addicted to field sports, and unused to the game of statecraft. The wily old diplomatist hoped to rule Florence as grand vizier under this inexperienced princeling. He was mistaken, however, in his schemes, for Cosimo displayed the genius of his family for politics, and coldly dismissed his would-be lord-protector. Guicciardini retired in disgrace to his villa, where he spent his last years in the composition of the Storia d'Italia. He died in 1540 without male heirs.

Guicciardini was the product of a cynical and selfish age, and his life illustrated its sordid influences. Of a cold and worldly temperance, devoid of passion, blameless in his conduct as the father of a family, faithful as the son of the papal patrons, severe in the administration of the provinces committed to his charge, and indisputably able in his conduct of affairs, he was at the same time, and in spite of these qualities, a man whose moral nature inspires a sentiment of liveliest repugnance. It is not merely that he was ambitious, cruel, revengeful and avaricious, for these vices have existed in men far less antipathetic than Guicciardini. Over and above those faults, which made him odious to his fellow-citizens, we trace in him a meanness that our century is less willing to condone. His petty instigation to self-interest, his acquisition of fortune, his policy to secure his safety and the support of his family, his lack of taste and drollery, his audacity and cruelty to procure his ends, his mincing professions of integrity, his condescension in all but the grossest conditions of the world, if only he could use them for his own advantage, combined with the glaring discord between his opinions and his practice, form a character which would be contemptible in our eyes were it not so sinister. The social and political decadence of Italy, where patriotism was unknown, and only selfishness survived of all the motives that rouse men to action, found its representative and exponent in Guicciardini. When we turn from the man to the author, the decadence of the age and race that could develop a political philosophy so arid in its cynical despair of any good in human nature forces itself vividly upon our notice. Guicciardini seems to glory in his disillusionment, and uses his vast intellectual ability for the analysis of the corruption he had helped to make incurable. If one single treatise of that century should be chosen to represent the spirit of the Italian people in the last phase of the Renaissance, the historian might hesitate between the Principe of Machiavelli and the Ricordi politici of Guicciardini. The latter is perhaps preferable to the former on the score of comprehensiveness. It is, moreover, more exactly adequate to the actual situation, for the Principe has a divine spark of patriotism yet lingering in the cinders of its frigid science, an idealistic enthusiasm surviving in its political utterances; whereas a great Italian historian of this decade has justly described the Ricordi as "Italian corruption codified and elevated to a rule of life." Guicciardini is, however, better known as the author of the Storia d'Italia, that vast and detailed picture of his country's sufferings between the years 1494 and 1537. Judging him by this masterpiece of scientific history, he deserves less commendation as a writer than as a thinker and an analyst. The style is wearisome and prolix, attaining to precision at the expense of circumlocution, and setting forth the smallest particulars with the same distinctness as the main features of the narrative. The whole tangled skein of Italian politics, in that involved and stormy period, is unravelled with a patience and an insight that are above praise. It is the crowning merit of the author that he never ceases to be an impartial spectator—a cold and curious critic. We might compare him to an anatomist, with knife and scalpel dissecting the dead body of Italy, and pointing out the symptoms of her manifold diseases with the indifferent analysis of one who has no moral sensibility. This want of feeling, while it incapacitates Guicciardini a model for the scientific student, has impaired the interest of his work, deprived it entirely of the pathologist. Yet upon that agony of the Italian people, he does not seem to be aware that he is writing a great historical tragedy. He takes as much pains in laying bare the trifling causes of a petty war with Pisa as in probing the deep-seated ulcer of the papacy. Nor is he capable of painting the events in which he took a part, in their totality as a drama. Whatever he touches, lies already dead on the dissecting table, and his skill is that of the analytical pathologist. Consequently, he fails to understand the essential magnitude of the task, or to appreciate the vital vigour of the forces contending in Europe for mastery. This is very noticeable in what he writes about the Reformation. Notwithstanding these defects, inevitable in a writer of Guicciardini's temperament, the Storia d'Italia is undoubtedly the greatest historical work that had appeared since the beginning of the modern era. It remains the most solid monument of the Italian reason in the 16th century; the final triumph of that Florentine school of philosophical historians which included Machiavelli, Segni, Pitti, Nardi, Varchi, Francesco Vettori and Donato Giannotti. Up to the year 1857 the fame of Guicciardini as a writer, and the estimation of his writings, were established almost entirely upon the History of Italy, and on a few ill-edited extracts from his aphorisms. At that date his representatives, the counts Pierio and Luigi Guicciardini, opened their family archives, and committed to Signor Giuseppe Canestrini the publication of his hitherto inedited MSS. in ten important volumes. The vast mass of documents and finished literary work thus given to the world has thrown a flood of light upon Guicciardini, whether we consider him as a writer or as an citizen. It has raised his reputation as a political writer into the first rank, where he now holds a place of his own, the greatest of all Italian political minds. The History of Italy, and the Storia d'Italia, and the Storia Fiorentina, and the Discorsi, and the many works of Guicciardini, are good and sound, if not without a taint of Machiavelli; but it has coloured our moral judgment of his character and conduct with darker dyes. From the stores of valuable materials contained in those ten volumes, it will be enough here to cite (1) the Ricordi politici, already noticed, consisting of about 400 aphorisms on political and social topics; (2) the observations on Machiavelli's Discorsi, which bring into remarkable relief the views of Italy's two great theorists on statecraft in the 16th century, and show that Guicciardini regarded Machiavelli somewhat as an amiable visionary or political enthusiast; (3) the Storia Fiorentina, an early work of the author, distinguished by its animation of style, brilliancy of portraiture, and liberality of judgment; and (4) the Dialogo del reggimento di Firenze, also in all probability an early work, in which the various forms of government suited to an Italian
commonwealth are discussed with infinite subtlety, contrasted, and illustrated from the vicissitudes of Florence up to the year 1494. To these may be added a series of short essays, entitled Discorsi politici, composed during Guicciardini's Spanish legation. It is only after a careful perusal of these minor works that the student of history may claim to have comprehended Guicciardini, and may feel that he brings with him to the consideration of the Storia della vita di Francesco Guicciardini all the invaluable knowledge of the author, the personal feelings, and the guarded opinions. Indeed, it may be confidently affirmed that those who desire to gain an insight into the true principles and feelings of the men who made and wrote history in the 16th century will find it here far more than in the works designed for publication by the writer. Taken in combination with Machiavelli's treatises, the Opere inedite furnish a comprehensive body of Italian political philosophy anterior to the date of Fra Paolo Sarpi. (J. A. S.)

See Rosini's edition of the Storia d'Italia (10 vols., Pisa, 1819), and the Opere inedite, in 10 vols., published at Florence, 1857. A complete and initial edition of Guicciardini's works is now in preparation in the hands of Alessandro Gherardi of the Florence archives. Among the many studies on Guicciardini we may mention Agostino Rossi's Francesco Guicciardini e il governo fiorentino (2 vols., Bologna, 1896), based on many new documents; F. de Sanctis's Henry the Fifth and his Historical Puglia (Naples, 1879), and many passages in Professor F. Villari's Machiavel (Eng. trans., 1892); E. Benoist's Guichardin, historien et homme d'état italien au XVIIe siècle (Paris, 1862), and C. Giulio's Francesco Guicciardini et le savi opere inedite (Bologna, 1880) are not without value, but the authors had not had access to many important documents since published. See also Geoffroy's article "Une autobiographie de Guicciardin, d'après les ouvres inédites," in the Revue des deux mondes, 1879 (1st of February 1874).

GUICHARD, KARL GOTTLIEB (1724-1775), soldier and military writer, known as Quintus ICILIUS, was born at Magdeb- burg in 1724, of a family of French refugees. He was educated for the Church, and at Leiden actually preached a sermon as a candidate for the pasture. But he abandoned theology for more secular studies, especially that of ancient history, in which his learning attracted the notice of the prince of Orange, who promised him a vacant professorship at Utrecht. On his arrival, however, he found that another scholar had been elected by the local authorities, and he thereupon sought and obtained a commission in the Dutch army. He made the campaigns of 1747-48 in the Low Countries. In the peace which followed, his combined military and classical training turned his thoughts in the direction of ancient military history. His notes on this subject grew into a treatise, and in 1754 he went over to England in order to consult various libraries. In 1757 his Mémoires militaires sur les Grecs et les Romains appeared at the Hague, and when Carlyle wrote his Frederick the Great (1746), he turned to obtain information from the author, who, as Carlyle says, "You shall be Quintus Icilius," and as Major Quintus Icilius he was forthwith gazetted to the command of a free battalion. This corps he commanded throughout the later stages of the Seven Years' War, his battalion, as time went on, becoming a regiment of three battalions, and Quintus himself recruited seven more battalions of the same kind of troops. His command was almost always with the king's own army in these campaigns, but for a short time it fought in the western theatre under Prince Henry. When not on the march he was always at the royal headquarters, and it was he who brought about the famous interview between the king and Gellert (see Carlyle, Frederick the Great, ii. 109; Gellert, Briefwechsel mit Demotische Lucius, ed. Ebert, Leipzig, 1823, pp. 629-631) on the subject of national German literature. On 22nd January 1761 Quintus was ordered to sack the castle of Hubertusburg (a task which Major-General Saldern had point-blank refused to undertake, from motives of conscience), and carried out his task, it is said, to his own very considerable profit. The place cannot have been seriously injured, as it was soon afterwards the meeting-place of the diplomatists whose work ended in the peace of Hubertusburg, but the king never ceased to banter Quintus upon his supposed depredations. The very day of Frederick's triumphant return from the war saw the disbanding of most of the free battalions, including that of Quintus, but the major to the end of his life remained with the king. He was made lieutenant-colonel in 1765, and in 1773, in recognition of his work Mémoires critiques et historiques sur plusieurs points d'antiquités militaires, dealing mainly with Caesar's campaigns in Spain (Berlin, 1773), was promoted colonel.

He died at Potsdam, 1775.
GUIDE—GUIDO OF AREZZO

See vicomte de Noailles, Marius et soldats français en Amérique (1903); and E. Chevalier, Histoire de la marine française pendant la guerre de l'indépendance américaine (1872).

GUIDE (in Mid. Eng. gyde, from the Fr. guide; the earlier French form was guie, English "guy," the d was due to the Italian form guida; the ultimate origin is probably Teutonic, the word being connected with the base seen in O. Eng. wiian, to know), an agency for directing or showing the way, specifically a person who leads or directs a stranger over unknown or unmapped country, or conducts travellers and tourists through a town, or over buildings of interest. In European wars up to the time of the French Revolution, the absence of large and well-marked routes made the necessity of such directions almost a matter of urgency; and in the 18th century the general tendency to the stricter organization of military resources led in various countries to the training of guide officers (called Feldjäger, and considered as general staff officers in the Prussian army), whose chief duty it was to find, and if necessary establish, routes across country for those parts of the army that had to move parallel to the main road and as nearly as possible at deploying interval from each other, for in those days armies were rarely spread out so far as to have the use of two or more main roads. But the necessity for such precautions died away when adequate surveys (in which guide officers were, at any rate in Prussia, freely employed) were carried out, and, as a definite term of military organization to-day, "guide" possesses no more essential peculiarity than fustiller, grenadier or riferman. The genesis of the modern "Guide" regiments is perhaps to be found in a short-lived Corps of Guides formed by Napoleon in Italy in 1796, which appears to have been a personal escort or body guard composed of men who knew the country. In the Belgian army of to-day the Guide regiments correspond almost to the Guard cavalry of other nations; in the Swiss army the squadrons of "Guizi" act as divisional cavalry, and in this rôle doubtless are called upon occasion to lead columns. The "Queen's own Corps of Guides" of the Indian army consists of infantry companies and cavalry squadrons. In drill, a "guide" is an officer or non-commissioned officer told off to regulate the direction and pace of movements, the remainder of the unit maintaining their alignment and distances by him.

A particular class of guides are those employed in mountaineering, these are not merely to show the way but stand in the position of professional climbers with an expert knowledge of rock and snowcraft, which they impart to the amateur, at the same time assuring the safety of the climbing party in dangerous expeditions. This professional class of guides arose in the middle of the 19th century when Alpine climbing became recognized as a sport (see MOUNTAINEERING). It is thus natural to find that the Alpine guides have been requisitioned for mountaineering expeditions all over the world. In climbing in Switzerland, the central committee of the Swiss Alpine Club issues a guides' tariff which fixes the charges for guides and porters; there are three sections, for the Valais and Vaudois Alps, for the Bernese Oberland, and for central and eastern Switzerland. The names of many of the great guides have become historical. In Chamonix a statue has been raised to Jacques Balmat, who was the first to climb Mont Blanc in 1786. Of the more famous guides since the beginning of Alpine climbing may be mentioned Auguste Balmat, Michel Cros, Maquignay, J. A. Carrel, who went with E. Whymper to the Andes, the brothers Lauener, Christian Almer and Jakob and Melchior Anderson.

"Guide" is also applied to a book, in the sense of an elementary primer on some subject, or of one giving full information for travellers of a country, district or town. In mechanical usage, the term "guide" is of wide application, being used of anything which steadies or directs the motion of an object, as of the "leading" screw of a screw-cutting lathe, of a loose pulley used to steady a driving-belt, or of the bars or rods in a steam-engine which keep the sliding blocks moving in a straight line. The doublet "guy" is thus used of a rope which steadies a sail when it is being raised or lowered, or of a rope, chain or stay supporting a channel, mast,errick, &c.

GUIDI, CARLO ALESSANDRO (1650-1712), Italian lyric poet, was born at Pavia in 1650. As chief founder of the well-known Roman academy called "L'Arcadia," he had a considerable share in the reform of Italian poetry, corrupted at that time by the extravagance and bad taste of the poets Marini and Achillini and their school. The poet Guidi and the critic and juristic Gravina checked this evil by their influence and example. The genius of Guidi was lyric in the highest degree; his songs are written with singular force, and charm the reader, in spite of their brevity. His most celebrated poem is the entitled Alla Fornarina (The Baker's Wife); it is one of the most beautiful pieces of poetry of the 17th century.

Guidi was squint-eyed, humpbacked, and of a delicate constitution, but possessed undoubted literary ability. His poems were printed at Parma in 1671, and at Rome in 1704. In 1681 he published at Parma his lyric tragedy Amalasunta in Italy, and two pastoral dramas Daphne and Endymion. The last had the honour of being mentioned as a model by the critic Gravina, in his treatise on poetry. Less fortunate was Guidi's poetical version of the six homilies of Pope Clement XI., as first having been severely criticized, and then having proved to be the indirect cause of the author's death. A splendid edition of this version had been printed in 1712, and, the pope being then in San Gandolfo, Guidi went there to present him with a copy. On the way he found out a serious typographical error, which he took so much to heart that he was seized with an apoplectic fit at Frascati and died on the spot. Guidi was honoured with the special protection of Ranuccio II., duke of Parma, and of Queen Christina of Sweden.

GUIDICIONI, GIOVANNI (1580-1541), Italian poet, was born at Lucca in 1480, and died at Macerata in 1541. He occupied a high position, being bishop of Fossombrone and president of Romagna. The latter office nearly cost him his life; a murderer attempted to kill him, and had already touched his breast with his dagger when, conquered by the resolute calmness of the prelate, he threw away the weapon and fell at his feet, asking forgiveness. The Rime and Letters of Guidicicioni are models of elegant and natural Italian style. The best editions are those of Genoa (1740), Bergamo (1753) and Florence (1878).

GUIDO OF AREZZO (possibly to be identified with Guido de Sanctis Andreaes, authorized abbot of Gravina, 1141), Active about 1144. He has by many been called the father of modern music, and a portrait of him in the refectory of the monastery of Avellana bears the inscription Beatus Guido, inventiro musice. Of his life little is known, and that little is chiefly derived from the dedicatory letters prefixed to two of his treatises and addressed respectively to Bishop Theodald (not Theobald, as Burney writes the name) of Arezzo, and Michael, a monk of Pomposa and Guido's pupil and friend. Occasional references to the celebrated musician in the works of his contemporaries are, however, by no means rare, and from these it may be conjectured with all but absolute certainty that Guido was born in the last decade of the 10th century. The place of his birth is uncertain in spite of some evidence pointing to Arezzo; on the title-page of all his works he is styled Guido Aretinsius, or simply Aretins. At his first appearance in history Guido was a monk in the Benedictine monastery of Pomposa, and it was there that he taught singing and invented his educational method, by means of which, according to his own statement, a pupil might learn within five months what formerly it would have taken him ten years to acquire. Envy and jealousy, however, were his only reward, and by these he was compelled to leave his monastery. "inde est, quod me videat prolixis finibus exalaturn," as he says himself in the second of the letters above referred to. According to one account, he travelled as far as Bremen, called there by Archbishop Hermann in order to reform the musical service. But this statement has been doubted. Certain it is that not long after his flight from Pomposa Guido was living at Arezzo, and it was here that, about 1030, he received an invitation to Rome from Pope John XIV. He obeyed the summons, and the
GUIDO OF SIENA—GUIDO RENI

pope himself became his first and apparently one of his most proficient pupils. But in spite of his success Guido could not be induced to remain in Rome, the insalubrious air of which seems to have affected his health. In Rome he met again his former superior, the abbot of Pomposa, who seems to have repented of his conduct, and to have induced Guido to return to Pomposa; and here all authentic records of Guido's life cease. We only know that he died, on the 17th of May 1050, as prior of Avellana, a monastery of the Camaldulians; such at least is the statement of the chroniclers of that order. It ought, however, to be added that the Camaldulians claim the celebrated musician as wholly their own, and altogether deny his connexion with the Bene-

dictines.

The documents discovered by Dom Germain Morin, the Belgian Benedictine, about 1888, point to the conclusion that Guido was a Frenchman and lived from his youth upwards in the Benedictine monastery of St Maur des Fossés where he invented his novel system of notation and taught the brothers to sing by it. In codex 365 of the British Museum the composer of the "Micrologus" and other works by Guido of Arezzo is always described as Guido de Sancto Mauro.

There is no doubt that Guido's method shows considerable progress in the evolution of modern notation. It was he for the first time systematically used the lines of the staff, and the intervals or spatex between them. There is also little doubt that the names of the first six notes of the scale, ut, re, mi, fa, sol, la, still in use among Romance nations, were introduced by Guido, although he seems to have used them in a relative rather than in an absolute sense. It is well known that these words are the first six lines of hymn addressed to St John the Baptist, which may be given here:

*Ut* quaeant laxis resonare fibris
*Míra* gestorum famuli tuorum,
*Salve* pullovi *labil* reatum,
*Veni* sancte *Joanne*

In addition to this Guido is generally credited with the intro-
duction of the F clef. But more important than all this, perhaps, is the thoroughly practical tone which Guido assumes in his more theoretical writings, and which differs greatly from the clumsy scholasticism of his contemporaries and predecessors.

The most important of Guido's treatises, and those which are generally acknowledged to be authentic, are *Micrologus Guidonis de disciplina artis musicae*, dedicated to Bishop Theobald of Arezzo, and comprising a complete theory of music, in 20 chapters; *Musicae Guidonis regulae rhythmicae in antiphonarii sui prolatae*, written in trochaic decasyllables of anything but classical structure; *Aliae Guidonis regulae rhythmicae in antiphonarii sui prolatae*; and the Epistola Guidonis Michaeli monachi de ignoto cani, already referred to. These are published in the second volume of the *Bibliotheca Musicorum Medii Aevi*, and a very important manuscript unknown to Gerbert (the Codex bibliothecae Ulicensis, in the Paris library) contains, besides minor treatises, an antiphonarium and gradual undoubtedly belonging to Guido.

See also L. Angeloni, G. D'Arezzo (1811); Kiesewetter, Guido von Arezzo (1840); Kornmüller, "Leben und Werken Guidus von Arezzo," in Habert's *Jahrh.* (1876); Antonio Brandi, G. Aretino (1884); G. B. Ristori, *Biografia di Guido monaco d'Arezzo* (1868).

GUIDO OF SIENA. The name of this Italian painter is of considerable interest in the history of art, on the ground that, if certain assumptions regarding him could be accepted as true, he is by far the earliest painter of whom we have any knowledge. He left the monastery of Pomposa, rather inclined to supersede him in, the honour of having given the first onward impulse to the art of painting. The case stands thus. In the church of S. Domenico in Siena is a large painting of the "Virgin and Child Enthroned," with six angels above, and in the Bene-
dictine convent of the same city is a triangular pinnacle, once a portion of the same composition, representing the Saviour in benediction, with two angels; the entire work was originally a triptych, but is not so now. The principal section of this picture has a rhymed Latin inscription, giving the painter's name as Gu... o de Senis, with the date 1221: the genu-

oess of the inscription is not, however, free from doubt, and especially it is maintained that the date really reads as 1281. In the general treatment of the picture there is nothing to distinguish it particularly from other work of the same early period; but the heads of the Virgin and Child are indisputably very superior, in natural character and graceful dignity, to anything to be found anterior to Cimabue. The question there-
fore arises, Are these heads really the work of a man who painted in 1221? Crowe and Cavalcaselle pronounce in the negative, concluding that the heads are repainted, and are, as they now stand, due to some artist of the 14th century, perhaps Ugolino da Siena; thus the claims of Cimabue would remain undisturbed and in their pristine vigour. Beyond this, little is known of Guido of Siena. There is only the Academy of Siena which assigns to him, a half-figure of the "Virgin and Child," with two angels, dating probably between 1250 and 1300; also in the church of S. Bernardino in the same city a Madonna dated 1262. Milanesi thinks that the work in S. Domenico is due to Guido Graziani, of whom no other record remains earlier than 1278, when he is mentioned as the painter of a banner. Guido da Siena appears always to have painted on panel, not in fresco on the wall. He has been termed, very dubiously, a pupil of Pietrocola, and the master of "Diotisalvi," Mino da Turrita and Berlinghieri da Lucca.

GUIDO RENI (1575-1642), a prime master in the Bolognese school of painting, and one of the most admired artists of the period of incipient decadence in Italy, was born at Cunezzano near Bologna on the 4th of November 1575. His father was a musician of repute, a player on the flute; he wished to bring the lad up to perform on the harpsichord. At a very childish age, however, Guido displayed a determined bent towards the art of form, scribbling some attempt at a drawing here, there and everywhere. He was only nine years of age when Denis Calvart took notice of him, received him into his academy of design by the father's permission, and rapidly brought him forward, so that by the age of thirteen Guido had already at-

ained marked proficiency. Albani and Domenichino became soon afterwards pupils in the same academy. With Albani Guido was very intimate up to the earlier period of manhood, but they afterwards became rivals, both as painters and as heads of ateliers, with a good deal of asperity on Albani's part; Domenichino was also pitted against Reni by the policy of Annibale Caracci. Guido was still in the academy of Calvart when he began frequenting the opposition school kept by Lodovico Caracci, whose style, far in advance of that of the Flemish painter, he dallied with. This exasperated Calvart, Him Guido, not yet twenty years of age, cheerfully quitted, transferring himself openly to the Caracci academy, in which he soon became prominent, being equally skilful and ambitious. He had not been a year with the Caracci when a work of his excited the wonder of Agostino and the jealousy of Annibale. He was only nineteen, and was completely cherished by him, and frequently painted him as an angel, for the youthful Reni seems to have scarcely had a rival. After these, however, Lodovico also felt himself nettled, and he patronized the competing talents of Giovanni Barbier. On one occasion Guido had made a copy of Annibale's "Descent from the Cross"; Annibale asked to retouch it, and, finding nothing to do, exclaimed pettishly, "He knows more than enough " ("Costui ne sa troppo "). On another occasion Lodovico, con-

sulted as umpire, lowered a price which Reni asked for an early picture. This slight determined the young man to be a pupil to none. He left the Caracci, and started his own account as a competitor in the race for patronage and fame. A renowned work, the story of "Callisto and Diana," had been completed before he left.

Guido was faithful to the eclectic principle of the Bolognese school of painting. He had appropriated something from Calvart, much more from Lodovico Caracci; he studied with much zest after Albert Dürer; he adopted the massive, sombre and parly uncouth manner of Caravaggio. One day Annibale Caracci made the remark that a style might be formed reversing the cast of Caravaggio in such matters as the ponderous shadows and the gross common forms; this observation germinated in Guido's mind, and he endeavoured after some such style, aiming constantly at suavity. Towards 1602 he went to Rome with Albani, and Rome remained his headquarters for twenty years.
Here, in the pontificate of Paul V. (Borghese), he was greatly noted and distinguished. In the garden-house of the Rospigliosi Palace he painted the vast fresco which is justly regarded as his masterpiece—"Phoebus and the Hours preceded by Aurora." This exhibits his second manner, in which he had deviated far indeed from the promptings of Caravaggio. He founded now chiefly upon the antique, more especially the Nioche group and the "Venus of Medici," modified by suggestions from Raphael, Correggio, Parmigianino and Paul Veronese. Of this last painter, although on the whole he did not get much from him, Guido, a particular admirer; he used to say that he would rather have been Paul Veronese than any other master—Paul was more nature than art. The "Aurora" is beyond doubt a work of pre-eminent beauty and attainment; it is stamped with pleasurable dignity, and, without being effeminate, has a more uniform aim after graceful selectness than can readily be traced in previous painters greater though some of them had been in impulse and personal fervour of genius. The pontifical chapel of Montecavallo was assigned to Reni to paint; but, being straitened in payments by the ministers, the artist made off to Bologna. He was fetched back by Paul V. with ceremonious éclat, and lodging, living and equipage were supplied to him. At another time he migrated from Rome to Naples, having received a commission to paint the chapel of S. Gennaro.

The notorious cabal of three painters resident in Naples—Corenzio, Caracciolo and Ribera—offered, however, as stiff an opposition to Guido as to some other interlopers who pretended and succeeded him. They gave his servant a beating by the hands of two unknown bullies, and sent by him a message to his master to depart or prepare for death; Guido waited for no second warning, and departed. He now returned to Rome; but he finally left that city abruptly, in the pontificate of Urban VIII., in consequence of an offensive reprimand administered to him by Cardinal Spinola. He had received an advance of 400 scudi on account of an altarpiece for St Peter's, but after some lapse of years had made no beginning with the work. A broad reminder from the cardinal put Reni on his mettle; he returned the 400 scudi, quitted Rome within a few days, and steadily resisted all attempts at recall. He now resettled in Bologna. He had taught as well as painted in Rome, and he left pupils behind him; but on the whole he did not stamp any great mark upon the Roman school of painting, apart from his own numerous works in the papal city.

In Bologna Guido lived in great splendour, and established a celebrated school, numbering more than two hundred scholars. He himself drew in it, even down to his latest years. On first opposing to Guido this city, he charged about £20 for an almsman with figure (mere portraits are not here in question), half this sum for a half-length, and £5 for a head. These prices must be regarded as handsome, when we consider that Domenichino about the same time received only £10, 10s. for his very large and celebrated picture, the "Last Communion of St Jerome." But Guido's reputation was still on the increase, and in process of time he quintupled his prices. He now left Bologna hardly at all; in one instance, however, he went off to Ravenna, and, along with three pupils, he painted the chapel in the cathedral with pictures of the "Inferno." His shining prosperity was not to last till the end. Guido was dissipated, generously but indiscriminately profuse, and an inveterate gambler. The gambling propensity had been his from youth, but until he became elderly it did not noticeably damage his fortunes. It grew upon him, and in a couple of evenings he lost the enormous sum of 14,400 scudi. The vice told still more ruinously on his art than on his character. In his decline he sold his time at so much per hour to certain picture dealers; one of them, the Shylock of his craft, would stand by, watch in hand, and see him work. Half-heartedness, half-performance, blighted his product: self-repetition and mere mannerism, with affectation for sentiment and vapidity for beauty, became the art of Guido. Some of these trade-works, heads or half-figures, were turned out in three hours or even less. It is said that, tardily wise, Reni left off gambling for nearly two years; at last he relapsed, and his relapse was followed not long afterwards by his death, caused by malignant fever. This event took place in Bologna on the 18th of August 1622; he died in debt, but was buried with great pomp in the church of S. Domenico.

Guido was a person of the most modest, although he valued himself on his position in the art, and would tolerate no slight in that relation; he was extremely upright, temperate in diet, nice in his person and his dress. He was fond of stately houses, but could feel also the advantages of a humble residence. He had little taste for controversy; and the jealousy which his abilities and his successes excited, now from the Caracci, now from Albani, now from the Bolognese guild of Neapolitan painters, may naturally have kept this feeling of religious exercise. He lived and worked to his last, Simone Cantarini, named Il Pesaresse, counts as the most distinguished; he painted an admirable head of Reni, now in the Bolognese Galerie Spada, and was the first to be called to the gallery of Florence and which he painted on his own hand. Two other good scholars were Giacomo Semenza and Francesco Gessi.

The character of Guido's art is so well known as hardly to call for detailed analysis, beyond what we have already intimated. His most characteristic style exhibits a perfecte ideal, of form rather than character, with a slight mode of handling, and silvery, somewhat cold, colour. In working from the nude he aimed at perfection of form, especially marked in the hands and feet. But he was far from always going to choice nature for his model; he transmuted of libiam, and painted, it is averred, a Magdalene of demoniacal compared to the grandiloquent and vulgular kind. His best works have beauty, great amenity, artistic feeling and high accomplishment of manner, all alloyed by a certain core of commonplace: the worst is commonplace, and the commonplace swamps everything, and Guido has flooded European collections—more than a hundred of these containing life-sized figures. The pretentiousness, all the more noxious in that its apparent grace of sentiment and form misleads the unwary into approval, and the dilettante Bilderstoffer into cheap reputation. Both in Rome and wherever else he worked, he introduced increased softness of style, which was then designated as the modern method. His pictures are mostly Scriptural or mythologic in subject, and between two and three hundred of them are to be found in various European collections—more than a hundred of these containing life-sized. The portraits which he executed are few—those of Sixtus V., Cardinal de' Medici and Beatrice, whose avert to Lanzo; and the most noticeable. The identity of the last-named portrait is very dubious; it certainly cannot have been painted direct from Beatrice, who had been executed in Rome before Guido ever resided there. Many etchings are attributed to him—some from his own works, and some after other masters; they are spirited, but rather negligent.

Of other works not already noticed, the following should be named—"in Rome (the Vatican), the "Coronation of St Peter," an example of the painter's earlier manner; in St. Lorenzo, Lucina, "Christ Crucified!"; in Forli, the "Conception"; in Bologna, the "Alms of St Roch" (early), the "Massacre of the Innocents," and "St. George," or La Magnanima (the church of the Mendicant), which is by many regarded as Guido's prime executive work; in the Dresden Gallery, an "Ecce Homo"; in Milan (Brera Gallery), "Saints Peter and Paul"; in Genoa (church of St. George), "St. Paul the Hermit and St Anthony in the Wilderness." The celebrated picture of "Fortune" (in the Capitol) is one of Reni's finest productions of that period; the "Cupids D'abondance" and the "Samson Drinking from the Jawbone of an Ass" might be named beside it. One of his latest works of mark is the "Ariadne," which used to be in the Gallery of the Capitol. The Louvre contains two figures of his pictures, the National Gallery of London seven, and others were once there, now removed to other public collections. The most interesting of the seven is the small "Coronation of the Virgin," painted on copper, an elegantly finished work, more pretty than beautiful. It was probably painted before the master quitted Bologna for Rome.

For the life and works of Guido Reni, see Bolognini, Vita di Guido Reni (2nd ed. 1838); and Malvasia, Vita de' Pittori; and Malvasia, Pittori di Padua; also Lanzi, Storia pittorica.

GUINNE, an old French province which corresponded roughly to the Aquitania Secunda of the Romans and the archbishopric of Bordeaux. In the 12th century it formed with Gascony the duchy of Aquitaine, which passed under the dominion of the kings of England by the marriage of Eleanor of Aquitaine to Henry II.; but in the 13th, through the conquests of Philip Augustus, it became confined within the narrower limits fixed by the treaty of Paris (1259). It is at this point that Guineau becomes distinct from Aquitaine. It then comprised the Bordeleus (the old countship of Bordeaux), the Bazadais, part of Périgord, Limousin, Quercy and Rouergue, the Agenais ceded by Philip III. (the Bold) to Edward I. (1279), and (still united with Gascony) formed a
duchy extending from the Charente to the Pyrenees. This
duchy was held on the terms of homage to the French kings,
an onerous obligation; and both in 1296 and 1234 it was con-
iscated by the kings of France on the ground that there had
been a failure in the feudal duties. At the treaty of Brétigny
(1360) Edward III. acquired the full sovereignty of the duchy
of Guienne, together with Aunis, Saintonge, Angoumois and
Poitou. The victories of du Guesclin and Gaston Phoebus,
count of Foix, restored the duchy soon after to its 13th-century
limits. In 1451 it was conquered and finally united to the
French crown by Charles VII. In 1469 Louis XI. gave it in
exchange for Champagne and Brie to his son, afterwards
king of France; after whose death in 1472 it was again united
to the royal dominion. Guienne then formed a government which
from the 17th century onwards was united with Gascony.
The government of Guienne and Gascony, with its capital at
Bordeaux, lasted till the end of the ancien régime. Under the
Revolution the departments formed from Guienne proper were
those of Girondes, Lot-et-Garonne, Dordogne, Lot, Aveyron
and the chief part of Tarn-et-Garonne.

GUIGNES, JOSEPH DE (1727–1808), French orientalist, was
born at Melun on the 29th of October 1727. He succeeded
Fourmont at the Royal Library as secretary interpreter of the
Eastern languages. A Mémoire historique sur l’origine des
Huns et des Turcs, published by de Guignes in 1748, obtained his
admission to the Royal Society of London in 1752, and he
became an associate of the French Academy of Inscriptions
in 1754. Two years later he began to publish his learned and
laborious Histoire générale des Huns, des Mongoles, des Turcs
et des autres Tartares occidentaux (1756–1758); and in 1757 he
was appointed to the chair of Syracus at the Collège de France.
He maintained that the Chinese nation had originated in
Egyptian colonization, an opinion to which, in spite of every
argument, he obstinately clung. He died in Paris in 1800.
The Histoire had been translated into German by Dähnert
(1768–1771). De Guignes left a son, Christian Louis Joseph
(1759–1845), who, after learning Chinese from his father, went
as consul to Canton, where he spent seventeen years. On his
return to France he was charged by the government with the
work of preparing a Chinese-French-Latin dictionary (1813).
He was also the author of a work of travels (Voyages à Pékin,

See Quérard, La France littéraire, where a list of the memoirs
contributed by de Guignes to the Journal des savants is given.

GUILBERT, YVETTE (1869– ), French d’issuë, was born in
Paris. She served for two years until 1885 in the Magasin du
Printemps, when, on the advice of the journalist, Edmond
Stoullig, she trained for the stage under Landor. She made
her début at the Bouffes du Nord, then played at the Variétés,
and in 1890 she received a regular engagement at the Eldorato
to sing a couple of songs at the beginning of the performance.
She also sang at the Ambassadeurs. She soon won an immense
vogue by her rendering of songs drawn from Parisian lower-class
life, or from the humours of the Latin Quarter, “Quatre s’évédi-
ants” and the “Hôtel du nombre trois” being among her early
triumphs. Her adoption of an habitual yellow dress and long
black gloves, her studied simplicity of diction, and her ingenious
delivery of songs charged with risqué meaning, made her famous.
She owed something to M. Xanrof, who for a long time composed
songs especially for her, and perhaps still more to Aristide Bruant,
who wrote many of her argot songs. She made successful tours
in England, Germany and America, and was in great request as
an entertainer in the houses. In 1895 she married Dr M.
Schiller. In later years she discarded something of her earlier
manner, and sang songs of the “pompadour” and the “crino-
line” period in costume. She published the novels La Vedette
and Les Demi-véicles, both in 1902.

GUILDFORD, a market town and municipal borough, and
the county town of Surrey, England, in the Guildford para-
liamentary division, 29 m. S.W. of London by the London and
South Western railway; served also by the London, Brighton,
and South Coast and the South Eastern and Chatham railways.
known as Gog and Magog. These were set up in 1708, but the appearance of giants in city pageants is of much earlier date.

_GUILFORD, BARONS AND EARLS OF._ FRANCES NORTH, 1st Baron Guilford (1637-1685), was the third son of the 4th Baron North (see NORTH, BARONS), and was created Baron Guilford in 1683, after becoming lord keeper in succession to Lord Nottingham. He had been an eminent lawyer, solicitor-general (1671), attorney-general (1673), and chief-justice of the common pleas (1675), and in 1679 was made a member of the council of thirty and on its dissolution of the cabinet. He was a man of wide culture and a staunch royalist, and was the grandfather of Lady Frances Pope, daughter and co-heiress of the earl of Downe, who inherited the Wroxton estate; and he was succeeded as 2nd baron by his son Francis (1673-1729), whose eldest son Francis (1704-1790), after inheriting first his father's title as 3rd baron, and then in (1734) the barony of North from his kinsman the 6th Baron North, was in 1752 created 1st earl of Guilford. His first wife was a daughter of the earl of Halifax, and his son and successor Frederick was the English prime minister, commonly known as Lord North, his courtesy title when he was elevated.

FREDERICK NORTH, 2nd earl of Guilford, but better known by his courtesy title of Lord North (1732-1792), prime minister of England during the important years of the American War, was born on the 13th of April 1732, and after being educated at Eton and Christ Church, Oxford, was sent to make the grand tour of the continent. On his return he was, though only twenty-two years of age, at once elected M.P. for Banbury, of which town his father was high steward; and he sat for the same town in parliament for nearly forty years. In 1759 he was chosen by the duke of Newcastle to be a lord of the treasury, and continued in the same office under Lord Butte and George Grenville till 1766. He had shown himself such a ready debater that on the fall of the first Rockingham ministry in 1766 he was sworn of the privy council, and made paymaster-general by the duke of Grafton. His reputation for ability grew so high that in December 1767, on the death of the brilliant Charles Townshend, he was made chancellor of the exchequer. His popularity with both the House of Commons and the people continued to increase, for his temper was never ruffled, and his quiet humour perpetually displayed; and, when the retirement of the duke of Grafton was necessitated by the hatred he inspired and the attacks of Junius, no better successor could be found for the premiership than the chancellor of the exchequer. Lord North succeeded the duke in March 1770, and continued in office for twelve of the most eventful years in English history. George III. had at last overthrown the ascendancy of the great Whig families, under which he had so long groaned, and determined to govern as well as rule. He knew that he could only govern by obtaining a majority in parliament to carry out his wishes, and this he had at last obtained by a great expenditure of money in buying seats and by a careful exercise of his patronage. But in addition to a majority he must have a minister who would consent to act as his lieutenant, and such a minister he found in Lord North. How a man of undoubted ability such as Lord North was could allow himself to be thus used as a mere instrument cannot be explained; but the confidential tone of the king's letters seems to show that there was an unusual intimacy between them, which may account for North's compliance. The path of the minister in parliament was a hard one; he had to defend measures which he had not designed, and of which he had not approved, and this too in a House of Commons in which all the oratorical ability of Burke and Fox was against him, and when he had only the purchased help of Thurlow and Wedderburne to aid him. The most important events of his ministry were those of the American War of Independence. He cannot be accused of causing it, but one of his first acts was the retention of the tea-duty, and he it was also who introduced the Boston Port Bill in 1774. When the war had broken out he earnestly counselled peace, and it was only the earnest solicitations of the king not to leave his sovereign again at the mercy of the Whigs that induced him to defend a war which from 1779 he knew to be both hopeless and impolitic. At last, in March 1782, he insisted on resigning after the news of Cornwallis's surrender at Yorktown, and no man left office more bitterly. He had been well rewarded for his assistance to the king: his children had good securities; his half-brother, Brownlow North (1741-1820), was bishop of Winchester; he himself was chancellor of the university of Oxford, lord-lieutenant of the county of Somerset, and had finally been made a knight of the Garter, an honour which has only been conferred on three other members of the House of Commons, Sir R. Walpole, Lord Castlereagh and Lord Palmerston. Sir R. North did not remain long out of office, but in April 1783 formed his famous coalition with his old subordinate, C. J. Fox (q.v.), and became secretary of state with him under the nominal premiership of the duke of Portland. He was probably urged to this coalition with his old opponent by a desire to show that he could act independently of the king, and was not a mere royal mouthpiece. The coalition ministry went out of office on Fox's India Bill in December 1783, and Lord North, who was losing his sight, then finally gave up political ambition. He played, when quite blind, a somewhat subsidiary part in the debates on the Regency Bill in 1786, and in the next year succeeded his father as earl of Guilford. He did not long survive his elevation, and died peacefully on the 5th of August 1792. It is impossible to consider Lord North a great statesman, but he was a most good-tempered and humorous member of the House of Commons. In a time of unexamined party feeling he won the esteem and almost the love of his most bitter opponents. Burke finely sums up his character in his Letter to a Noble Lord: "He was a man of admirable parts, of general knowledge, of a versatile understanding, fitted for every sort of business; of infinite wit and pleasantry, of a delightful temper, and with a mind most disinterested. But it would be only to degrade myself," he continues, "by a weak adulation, and not to honour the memory of a great man, to deny that he wanted something of the vigilance and spirit of command which the times required." By his wife Anne (d. 1797), daughter of George Speke of White Lackington, Somerset, Guilford had four sons, the eldest of whom, George Augustus (1757-1802), became 3rd earl on his father's death. This earl was a member of parliament from 1778 to 1792 and was a member of his father's ministry and also of the royal household; he left no issue. The next earl, John (1761-1827), who succeeded his father in 1795, was 3rd earl of Guilford, and was remarkable for his great knowledge and love of Greece and of the Greek language. He had a good deal to do with the foundation of the Ionian university at Corfu, of which he was the first chancellor and to which he was very liberal. Guilford, who was governor of Ceylon from 1796 to 1805, died unmarried on the 14th of October 1827. His cousin, Francis (1772-1851), a son of Brownlow North, bishop of Winchester from 1751 to 1820, was the 6th earl, and the latter's descendant, Frederick George (b. 1836), became 8th earl in 1886.

On the death of the 3rd earl of Guilford in 1882 the barony of North fell into abeyance between his three daughters, the survivor of whom, Susan (1797-1884), wife of John Sidney Doyle, who took the name of North, was declared by the House of Lords in 1841 to be Baroness North, and the title passed to her son, William Henry John North, the 11th baron (b. 1836) (see NORTH, BARONS).

GUILFORD, a township, including a borough of the same name, in New Haven county, Connecticut, U.S.A., on Long Island Sound and at the mouth of the Menunkatuck or West.
river, about 16 m. E. by S. of New Haven. Pop. of the township, including the borough (1900), 2785, of whom 387 were foreign-born; (1910) 3001; pop. of the borough (1910), 1668. The borough is served by the New York, New Haven & Hartford railroad. On a plain is the borough green of nearly 12 acres, which is shaded by some fine old elms and other trees, and in which there is a soldiers' monument. About the green are several churches and some of the better residences. On an eminence commanding a fine view of the Sound is an old stone house, erected in 1639 for a parsonage, meeting-house and fortification; it was made a state museum in 1898, when extensive alterations were made to restore the interior to its original appearance. The Point of Rocks, in the harbour, is an attractive place, especially in the summer season. There are about 12 ft. of water on the harbour bar at high tide. The principal industries of Guilford are coastwise trade, the manufacture of iron castings, brass castings, wagon wheels and school furniture, and the canning of vegetables. Near the coast are quarries of fine granite; the stone for the pedesstal of the Statue of Liberty on Bedloe's Island, in New York Harbour, was taken from them.

Guilford was founded in 1639 as an independent colony by a company of twenty-five or more families from Kent, Surrey and Sussex, England. In the early 1640s, the community became a member of the New Haven Jurisdiction, and then only to meet the requirements for admission to this union were the church and church state modelled after those of New Haven. Even then, though suffrage was restricted to church members, Guilford planters who were not church members were required to attend town meetings and were allowed to offer objections to any proposed order or law. From 1661 until the absorption of the members of the New Haven Jurisdiction by Connecticut, in 1664, William Leete (1611-1683), one of the founders of Guilford, was governor of the Jurisdiction, and under his leadership Guilford took a prominent part in furthering the submission to Connecticut, which did away with the church state and the restriction of suffrage to freemen. Guilford was the birthplace of Fitz-Greene Halleck (1790-1867), the poet; of Samuel Johnson (1666-1771), the first president of King's College (now Columbia University); of Abraham Baldwin (1754-1807), prominent as a statesman and the founder of the University of Georgia; and of Thomas Chittenden, the first governor of Vermont. The borough was incorporated in 1815.

GUILLAUME, JEAN BAPTISTE CLAUDE EUGÈNE (1822—1905), French sculptor, was born at Montbard on the 4th of July 1822, and studied under Cavelier, Millet, and Barrias, at the École des Beaux-Arts, which he entered in 1841, and where he gained the prix de Rome in 1845 with “ Theseus finding on a rock his Father’s Sword.” He became director of the École des Beaux-Arts in 1864, and director-general of Fine Arts from 1878 to 1879, when the office was suppressed. Many of his works have been bought for public galleries, and his monotypes are to be found in the public squares of the chief cities of France. At Rheims there is his bronze statue of “ Colbert,” at Dijon his “ Rameau” monument. The Luxembourg Museum has his “ Anacreon” (1852), “ Les Gracques” (1853), “ Faucheur” (1855), and the marble bust of “Mgr Darboy”; the Versailles Museum the portrait of “ Thiers”; the Sorbonne Library the marble bust of “Victor le Clerc, doyen de la faculte des lettres.”

Other works of his are at Trinity Church, St Germain l’Auxerrois, and the church of St Clotilde, Paris. Guillaume was a prolific writer, and a courtier of great literary reputation during the Classic period and of the Italian Renaissance. He was elected member of the Académie Française in 1862, and in 1891 was sent to Rome as director of the Académie de France in that city. He was also elected an honorary member of the Royal Academy, London, 1869, on the institution of that class.

GUILLAUME DE LORRIS (fl. 1230), the author of the earlier section of the Roman de la rose, derives his surname from a small town about equidistant from Montargis and Gien, in the present department of Loiré. This and the fact of his authorship may be deduced from an alliteration of his name, “ Guillaume,” with the rubric of his poem, where his own part finishes, attributes Jean de Meun’s continuation to a period forty years later than William’s death and the consequent interruption of the romance. Arguing backwards, this death used to be put at about 1260; but Jean de Meun’s own work has recently been dated earlier, and so the composition of the first part has been thrown back to a period before 1240. The author represents himself as having dreamed the dream which furnished the substance of the poem in his twentieth year, and as having set to work to rhyme it “ five years later. The later and longer part of the Roman shows signs of greater intellectual vigour and wider knowledge than the earlier and shorter, but Guillaume de Lorris is to all appearance more original. The great features of his four or five thousand lines, in the first place, the extraordinary vividness and beauty of his word-pictures, in which for colour, freshness and individuality he has not many rivals except in the greatest masters, and, secondly, the fashion of allegorical presentation, which, hackneyed and wearisome as it afterwards became, was evidently in his time new and striking. There are of course traces of it before, as in some romances, such as those of Raoul de Houdenc, in the troubadours, and in other writers; but it was unquestionably Guillaume de Lorris who fixed the style.

For an attempt to identify Guillaume de Lorris see L. Jarry, Guillaume de Lorris et le testament d’Alphonse de Poitiers (1881). Also Paulin Paris in the Hist. litt. de la France, vol. xxii.

GUILLAUME DE PALERME (William of Palerne), hero of romance. The French verse romance was written at the desire of a Countess Volandre, generally identified with Voland, daughter of Baldwin IV, count of Flanders. The English poem in alliterative verse was written about 1350 by a poet called William, at the desire of Humphrey Bohun, earl of Hereford, (d. 1361). Guillaume, a foundling supposed to be of low degree, is brought up at the court of the emperor of Rome, and loves his daughter Melior who is destined to be a Greek prince. The lovers flee into the woods disguised in bear-skins. Alfonso, who is Guillaume’s cousin and a Spanish prince, has been changed into a wolf by his step-mother’s enchantments. He provides food and protection for the fugitives, and Guillaume eventually triumphs over Alfonso’s father, and wins back from him his kingdom. The benevolent werewolf is disinchanted, and marries Guillaume’s sister.

See Guillaume de Palerne, ed. H. Michelant (Soc. d. anc. textes fr., 1876); Hist. litt. de la France, xxii, 829; William of Palerne, ed. Sir F. Madden (Rosxburgh Club, 1842); and W. T. Skeat (E. E. 1867); M. Kaluza, in Eng. Studien (Heilbronn, iv. 1996). The prose version of the French romance, printed by N. Bonfons, passed through several editions.

GUILLAUME D’ORANGE (d. 812), also known as Guillaume Ferrabrace, St Guillaume de Gellone, and the Marquis au court
nez, was the central figure of the southern cycle of French romance, called by the *trouvères* the *geste* of Garin de Monglane. The cycle of Guillaume has more unity than the other great cycles of Charlemagne or of Doon de Mayence, the various poems which compose it forming branches of the main story rather than independent epic poems. There exist numerous cyclical MSS. in which there is an attempt at presenting a continuous *histoire poétique* of Guillaume and his family. MS. Royal 20 D xi. in the British Museum contains eighteen *chansons* of Guillaume. Guillaume, son of the first Vehme's nephew and of Ade, daughter of Charles Martel, was born in the north of France about the middle of the 8th century. He became one of the best soldiers and trusted counsellors of Charlemagne, and in 790 was made count of Toulouse, when Charles's son Louis the Pious was put under his charge. He subdued the Gascons, and defended Narbonne against the infidels. In 793 Hescham, the successor of Abd-al-Rahman II., proclaimed a holy war against the Christians, and collected an army of 100,000 men, half of which was directed against the kingdom of the Asturian kings, the second invaded France, penetrating as far as Narbonne. Guillaume met the invaders near the river Orbizue, at Villedaigne, where he was defeated, but only after an obstinate resistance which so far exhausted the Saracens that they were compelled to retreat to Spain. He took Barcelona from the Saracens in 803, and in the next year founded the monastery of Gellone (now Saint Guilhem-le-Désert), of which he became a member in 806. He died there in the odour of sanctity on the 28th of May 812.

The central fact of the *geste* of Guillaume is the battle of the Archamp or Aliscans, in which perished Guillaume's heroic nephew, Vezian or Vivien, a second Roland. At the eleventh hour he summoned Guillaume to his help against the overwhelming forces of the Saracens. Guillaume arrived too late to help Vivien, was himself defeated, and returned alone to his wife Guiboure, leaving his knights all dead or prisoners. This event is related in a Norman-French transcript of an old French manuscript of the *geste*, the *Chanson de Warres* preserved at Toulouse, and brought to light in 1901 at the sale of the books of Sir Henry Hope Edwards—in the *Covenant Vivien*, a recension of an older French chanson and in *Aliscans*. *Aliscans* continues the story, telling how Guillaume obtained reinforcements from Leon, and how, with the help of the comic hero, the scullion Rainouart or Rennewart, he avenged the defeat of Aliscans and his nephew's death. Rainouart turns out to be the brother of Guillaume's wife Guiboure, who was before her marriage the Saracen princess and enchantress Orable. Two other poems are consecrated to representation we have of the story, dating at least from the beginning of the 12th century. It seems probable that the Archant was situated in Spain near Vivien's headquarters at Tortosa, and that Guillaume started from Barcelona, not from Orange, to his nephew's help. The account of the disaster was modified by successive *trouvères*, and the uncertainty of their methods may be judged by the fact that in the *Chanson de Warres* two consecutive accounts (i. 450-1326 and ii. 1326-2420) of the fight appear to be set side by side as if they were separate episodes. *Le Couronnement Loys*, already mentioned, *Le Charroi de Nimes* (12th century) in which Guillaume, who had been forgotten in the distribution of fiefs, enumerates his services to the terrified Louis, and *Aliscans* (13th century), with the earlier *Chanson*, are among the finest of the French epic poems. The figure of Vivien is among the most heroic elaborated by the *trouvères*, and the giant Rainouart has more than a touch of Rabelaisian humour.

The *chansons de geste* of the cycle of Guillaume are: *Enfances Garin de Monglane* (15th century) and *Garin de Monglane* (13th century), on which is founded the prose romance of Guerin de Monglane, printed in the 19th century by Jehan Trepperel and *Givars de Vian* (13th century, by Bertrand de Bar-sur-Aube), ed. P. Tarbé (Reims, 1850); *Hernaut de Beaulande* (fragment 14th century); *Romier de Genies*, which only survives by W. prose form; *Aymer de Narbonne* (1210) by Bertrand de Bar-sur-Aube, ed. L. Demaison (Soc. des ancs. textes fr., Paris, vols., 1887); *Les Enfances Guillaume* (13th century); *Les Narbonnais*, ed. H. Souchier (Soc. des ancs. textes fr., 2 vols., 1898), with a Latin translation, dating from the 11th century and preserved at the Hôtel des Invalides; *Le Couronnement Loys* (ed. E. Langlois, 1888), *Le Charroi de Nimes*, *La Prize d'Orange*, *Le Covenant Vivien*, *Aliscans*, which were edited by W. prose form; *Aymer de Narbonne* (1210) by Bertrand de Hague, 1854; a critical text of *Aliscans* (Halle, 1903, vol. i.) is edited by F. W. Hartnacke, H. Hartnacke and R. Rasch; *Loquifer* and *Le Monnage Rainouart* (12th century); *Bon ve Commarquis* (13th century), recension of the earlier Siège de Barbaste, by Adené II.
GUILLEMOT—GUILLOTINE

Volck), Herzog Wilhelm von Aquitanien (Münster, 1865); F. P. Paris, in Hist. litt. à la France (vol. 32, 1882); R. Weeks, The newly discovered Chaucon de Willame (Chicago, 1904); A. Thomas, Études romanes (Paris, 1891), on L. de Toulouse; S. Vidal de Martres-Tolosane, in Bull. de l'enseignement à William le Héritier (Halle, 1860), and Der südfranzösische Sagenkreis und seine Produkte (Halle, 1868); J. Jeanroy, Études sur le cycle de Guillaume au court nez (in Romania, vol. 25 and 26, 1896-1897); H. Sucher, "Recherches sur... Guillaume d'Orange" (in Romania, vol. 32, 1903). The conclusions arrived at by earlier writers are confirmed by Joseph Bédier in his first volume, "Le Cycle de Guillaume d'Orange" (1898), of his Légendes épiques, in which he constructs a theory that the cycle of Guillaume d'Orange grew up round the various shrines on the pilgrim route to the tomb of the saint. 

It is variously known as the French guillemot, skidder, langy, and ice. Langy is the manor of the Langy family, or the family of the lord of the manor; it is the word from which the Latin word lingua, meaning "tongue," is derived. 

In former days the guillemot yearly frequented the cliffs on many parts of the British coasts in countless multitudes, and this is still the case in the northern parts of the United Kingdom; but more to the southward nearly all its smaller settlements have been rendered utterly desolate by the wanton and cruel destruction of their tenants during the breeding season, and even the inhabitants of those which were more crowded have had the same experience. 

Tempestuous weather will drive aho a great number in a state of utter destitution—many of them indeed are not infrequently dead—but what becomes of the bulk of the birds, not merely the comparatively few thousands that are natives of Britain, but the tens and hundreds of thousands, not to say millions, that are in summer denizens of more northern latitudes, no one can say. This mystery is not peculiar to the guillemot, but is shared by all the Alcidae that inhabit the Atlantic Ocean. Examples stray every season across the Bay of Biscay, are found off the coasts of Spain and Portugal, enter the Mediterranean and reach Italian waters, or, keeping farther south, may even touch the Madeiras, Canaries or Azores; but these bear no proportion whatever to the mighty hosts of whom they are literally the "scouts," and whose principal movements they are more revealed than in the case of the coves of a well-adjourned army. The common guillemot of both sides of the Atlantic is replaced farther northward by a species with a stouter bill, the U. aurio or U. brunneicchi of ornithologists, and on the west coast of North America by the U. californica. The habits of all these are essentially the same, and the structural resemblance between all of them and the Auks is so great that several ornithologists have relegated them to the genus Alca, confining the genus Uria to the guillemots of another group, of which the type is the U. grylta, the black guillemot of British waters, the dovekey or Greenland doveguillemot, the tysty or Shetlanders. This bill assumes in summer an entirely black plumage with the exception of a white patch on each wing, while in winter it is beautifully marbled with white and black. Allied to it as species or geographical races are the U. mandti, U. columbia and U. carbo. All these differ from the larger guillemots by laying two or three eggs, which are generally placed in some secure niche, while the members of the other group lay but a single egg, which is invariably exposed on a bare ledge. (A. N.)

GUIGOLO, a French word for an ornament, either painted or carved, which was one of the principal decorative bands employed by the Greeks in their temples or on their vases. 

The term is single, double or triple; they consist of a series of circles equidistant one from the other and enclosed in a band which winds round, as I have seen in and around Nîmes, where it is probably copied from Chaldæan work, as there is an early example at Erech which dates from the time of Gudea (2900 B.C.). The ornament as painted by the Greeks has almost entirely disappeared, but traces are found in the temple of Nemesis at Rhamnus; another example, by which the timber roofs of Greek temples were protected, it is painted in colours which are almost as brilliant as when first produced, those of the Treasury of Gela at Olympia being of great beauty. 

These examples are double guilloches, with two rows of circles, each with an independent interlacing band and united by a small arc with palmette inside; in both the single and double guilloches of Greek work there is a flower in the centre of the circles. 

In the triple guilloche, the centre row of circles comes half-way between the others, and the enclosing band crosses diagonally both ways, interlacing alternately with the upper and lower rows. The illusion of the triple guilloche is that it seems to the eye that the bird is so arranged that the convex upper curve is the centre of the cap and the small convex moulding over the circles of the capitals of the columns of the Erechtheum at Athens. 

It was largely employed in Roman work, and the single guilloche is found about as a border in mosaic pavements, not only in Italy but throughout Europe. In the Renaissance Italy it was also a favourite enrichment for borders and occasionally in France and England.

GUILLOX, MARIE NICOLAS SYLVESTRE (1760-1847), French ecclesiastic, was born in Paris on the 1st of January 1760. 

He was librarian and almoner after the death of the princess de Lamballe, and when she died in 1792, she was executed, he fled to the provinces, where under the name of Pastel he practised medicine. 

A man of facile conscience, he afterwards served in turn under Napoleon, the Bourbons and the Orleans, and became canon of St Denis, bishop of Morocco and dean of the Sorbonne.

Among his many literary works are a Collection des breves du pape Pie VI (1798), Bibliothèque choisie des pères grecs et latins (1822, 26 vols.) and a French translation of Cyprian with notes (1837, 2 vols.)

GUILLOTINE, the instrument for inflicting capital punishment by decapitation, introduced into France at the period of the Revolution. It consists of two upright posts surmounted by a cross beam, the back of which is heavily weighted to make it fall swiftly and with force when the cord by which it is held aloft is let go. Some
The Place de Grève for the execution of the highwayman Pelletier on the 25th April 1792. While the experiments regarding the machine were being carried on, it received the name Louise or La Petite Louison, but the mind of the nation seems soon to have reverted to Guillotine, who first suggested its use; and in the Journal des révolutions de Paris for 28th April 1792 it is mentioned as la guillotine, a name which it thenceforth bore both popularly and officially. In 1795 the question was more debated as to whether or not death by the guillotine was instantaneous, and in support of the negative side the case of Charlotte Corday was adduced whose countenance, it is said, blushed as if with indignation when the executioner, holding up the head to the public gaze, struck it with his fist. The connexion of the instrument with the horrors of the Revolution has hindered its introduction into other countries, but in 1853 it was adopted under the name of Folschwert or Fallbeil by the kingdom of Saxony; and it is used for the execution of sentences of death in France, Belgium and some parts of Germany. It has often been stated that Dr Guillotine perished by the instrument which bears his name, but it is beyond question that he survived the Revolution and died a natural death in 1814.

See Sédillot, Réflexions historiques et physiologiques sur le supplice de la guillotine (1795); Sue, Opinion sur le supplice de la guillotine, (1796); Jean-Baptiste Catala, Réflexions sur la guillotine (1801); Numa M. Crozet, Recherches historiques et physiologiques sur la guillotine et détails sur Sanson (Paris, 1843); and a pamphlet of J. W. Crozet in the Quarterly Review for December 1843, reprinted separately in 1850 under the title The Guillotine, a Historical Essay.

GUILT, a lapse from duty, a crime, now usually the fact of willful wrong-doing, the condition of being guilty of a crime, hence conduct deserving of punishment. The O. Eng. form of the word is guil. The New English Dictionary rejects for phonetic reasons the usually accepted connexion with the Teutonic root giel—, to pay, seen in Ger. gelden, to be of value, Geldgut, property, wealth.

GUIMARAES (sometimes written Guimaraens), a town of northern Portugal, in the district of Braga, formerly included in the province of Entre-Minho-c-Douro; 36 m. N.E. of Oporto by the Trofa-Guimarães branch of the Oporto-Corunna railway. Pop. (1900) 9104. Guimarães is a very ancient town with Moorish fortifications; and even the quarters which are locally described as new date partly from the 15th century. It occupies a low hill, skirted on the north-west by a small tributary of the river Ave. The citadel, founded in the 11th century by Countacy or Burgundy, was in 1499, the birthplace of his son Alphonso, the first king of Portugal. The font in which Alphonso was baptized is preserved, among other interesting relics, in the collegiate church of Santa Maria da Oliveira, "St Mary of the Olive," a Romanesque building of the 14th century, which occupies the site of an older foundation. This church owes its name to the legend that the Visigothic king Wamba (672–680) here declined the crown of Spain, until his olive wood spear-shaft blossomed as a sign that he should consent. The convent of São Domingos, now a museum of antiquities, has a fine 12th–13th century cloister; the town hall is built in the blend of Moorish and Gothic architecture known as Manoelitic. Guimarães has a flourishing trade in wine and farm produce; it also manufactures cutlery, linen, leather and preserved fruits. Near the town are Catiâna, the ruins of a prehistoric Iberian city, and the hot sulphurous springs of Talpas, frequented since the 4th century, when Guimarães itself was founded.

GUIMARD, MARIE MADELEINE (1743–1816), French dancer, was born in Paris on the 10th of October 1743. For twenty-five years she was the star of the Paris Opéra. She made herself even more famous by her love affair especially with the prince de Soubise. She bought a magnificent house at Pantin, and built a private theatre connected with it, where Collé's Partie de chasse de Henri IV which was prohibited in public, and most of the Proverbes of Carontelle (Louis Carrogis, 1717–1806), and similar licentious performances were given to the delight of high society. In 1772, in defiance of the
archbishop of Paris, she opened a gorgeous house with a theatre seating five hundred spectators in the Chaussée d'Antin. In this Temple of Terpsichore, as she named it, the wildest orgies took place. In 1730 she was compelled to get rid of the property and it was disposed of by lottery for her benefit for the sum of 300,000 francs. Soon after her retirement in 1789 she married Jean Etienne Guespéaux (1748-1820), dancer, song-writer and playwright.

**GUIMET, JEAN DESPÉRÉAUX** (1795-1871), French industrial chemist, was born at Voiron on the 20th of July 1795. He studied at the École Polytechnique in Paris, and in 1817 entered the Administration des Poudres et Salpêtres. In 1828 he was awarded the prize offered by the Société d'Encouragement pour l'Industrie Française. Naïl invented a process of making artificial marine with all the properties of the substance prepared from lapis lazuli; and six years later he resigned his official position in order to devote himself to the commercial production of that material, a factory for which he established at Fleurieux sur Saône. He died on the 8th of April 1871.

His son ÉMILE ÉTIENNE GUIMET, born at Lyons on the 26th of June 1836, succeeded him in the direction of the factory, and founded the Musée Guimet, which was first located at Lyons in 1879 and was handed over to the state and transferred to Paris in 1891. In 1876, a small museum was commissioned by the minister of public instruction to study the religions of the Far East, and the museum contains many of the fruits of this expedition, including a fine collection of Japanese and Chinese porcelain and many objects relating not merely to the religions of the East but also to those of Ancient Egypt, Greece and Rome. He wrote *Lettres sur l’Algérie* (1877) and *PROMENADES JAPONAISES* (1880), and also some musical compositions, including a grand opera, *Tal-Tsong* (1884).

**GUINEA,** the generic name applied by Europeans to part of the western coast region of equatorial Africa, and also to the gulf formed by the great bend of the coast line eastward and then southward. Like many other geographical designations the use of which is controlled neither by natural nor political boundaries, the name has been very differently employed by different writers and at different periods. In the widest accepta-
tion of the term, the Guinea coast may be said to extend from 13° N. to 16° S., from the neighbourhood of the Gambia to Cape Negro. Southern or Lower Guinea comprises the coasts of Gabun and Loango (known also as French Congo) and Portuguese possessions on the south-west coasts of the Western and Northern Guinea stretches from the river Casamance to and inclusive of the Niger delta, Cameroon occupying a middle position. In a narrower use of the name, Guinea is the coast only from Cape Palmas to the Gabun estuary. Originally, on the other hand, Guinea was supposed to begin as far north as Cape Nun, opposite the Canary Islands, and Gomes Azurara, a Portuguese historian of the 15th century, is said to be the first authority who brings the boundary south to the Senegal. The derivation of the name is uncertain, but is probably taken from Guinea, Ginen or Jenné, a town and kingdom in the basin of the Niger, famed for the enterprise of its merchants and dating from the 8th century A.D. The name Guinea is found on maps of the middle of the 14th century, but it did not come into general use in Europe till towards the close of the 15th century.\(^1\)

1 Guinea may, however, be derived from Ghana (or Ghanata) the name of the oldest known state in the western Sudan. Ghana dates, according to some authorities, from the 3rd century A.D. From the 7th to the 12th century it was a powerful empire, its dominions extending, apparently, from the Atlantic to the Niger bend. At one time Jenné was included within its borders. Ghana was finally conquered by the Mandingo kings of Melle in the 13th century. Its capital, also called Ghana, was west of the Niger, and is generally placed some 200 m. west of Jenné. In this district L. Desplagay discovered in 1929 numerous oval tombs of a once extensive city, which he identified as those of Ghana. The ruins lie 25 m. W. of the Niger, on both banks of a marigot, and are about 40 m. N. by E. of Kulikoro (see *La Geographie*, xli, 329). By some writers Ghana has been identified with the large salt flat, which, however, is not mentioned by Arab historians as the capital of Ghana. The identification of Ghana city with Jenné is not justified, though Idrisi seems to describe Jenné when writing of "Ghana the Great."

Although the term Gulf of Guinea is applied generally to that part of the coast south of Cape Palmas and north of the mouth of the Congo, particular indentations have their peculiar designa-
tions. The bay formed by the configuration of the land between Cape St Paul and the Nun mouth of the Niger is known as the Bight of Benin, the name being that of the once powerful native state whose territory formerly extended over the whole district. The Bight of Biafra, or Mafra (named after the town of Mafra in southern Portugal), between Capes Formosa and Lopez, is the most eastern part of the Gulf of Guinea; it contains the islands Fernando Po, Prince's and St Thomas. The name Biafra—
as indicating the country—fell into disuse in the later part of the 19th century.

The coast is generally so low as to be visible to navigators only within a very short distance, the mangrove trees being their only sailing marks. In the Bight of Biafra the coast forms an exception, being high and bold, with the Cameroon Mountains for background. At Sierra Leone also there is high land. The coast in many places maintains a dead level for 30 to 50 m. inland. Vegetation is exceedingly luxuriant and varied. The palm-oil tree is indigenous and abundant from the river Gambia to the Congo. The fauna comprises nearly all the more remark-
able African animals. The inhabitants are the true Negro stock.

By the early traders the coast of Upper Guinea was given names founded on the productions characteristic of the different parts. The Grain coast, that part of the Guinea coast extending for 500 m. from Sierra Leone eastward to Cape Palmas received its name from the export of the seeds of several plants of a peppery character, called variously grains of paradise, Guinea pepper and melgeuta. The name Grain coast was first applied to this region in 1455. It was occasionally styled the Windy or Grainward coast, from the frequency of short but furious tornadoes throughout the year. Towards the end of the 18th century, Guinea pepper was supplanted in Europe by peppers from the East Indies. The name now is seldom used, the Grain coast being divided between the British colony of Sierra Leone and the republic of Liberia. The Ivory coast extends from Cape Palmas to 3° W., and obtained its name from the quantity of ivory exported therefrom. It is now a French possession. Eastwards of the Ivory coast are the Gold and Slave coasts. The Niger delta was for long known as the Oil rivers. To two regions only of the coast is the name Guinea officially applied, the French and Portuguese colonies north of Sierra Leone being so styled.

Of the various names by which the divisions of Lower Guinea were known, Loango was applied to the country south of the Gabun and north of the Congo river. It is now chiefly included in French Congo. Congo was used to designate the country immediately south of the river of the same name, usually spoken of until the last half of the 19th century as the Zaire. Congo is now one of the subdivisions of Portuguese West Africa (see Angola). It must not be confounded with the Belgian Congo.

Few questions in historical geography have been more keenly discussed than that of the first discovery of Guinea by the navigators of modern Europe. Lancelot Malocello, a Genoese, in 1270 reached at least as far as the Canaries. The first direct attempt to find a sea route to India was, it is said, also made by Genoese, Ugolino and Guido de Vivaldo, Tedisio Doria and others who equipped two galleys and sailed south along the African coast in 1291. Beyond the fact that they passed Cape Nun there is no trustworthy record of their voyage. In 1416 a Catalan expedition started for "the river of gold" on the Guinea coast; its fate is unknown. The French claim that between 1364 and 1416 the people of Dieppe sent out several expeditions to Guinea; and Jean de Béthencourt, who settled in the Canaries about 1420, made explorations towards the south. At length the consecutive efforts of the navigators employed by Prince Henry of Portugal—Gil Eannes, Diniz Diaz, Nuno Tristam, Alvaro Fernandes, Cadamosto, Usodimare and Diego Gomez—made known the coast as far as the Gambia, and by the end
foot from dark greyish-brown to bright orange. That the home of this species is West Africa from the Gambia to the Gaboon is certain, but its range in the interior is quite unknown. It appears to have been imported early into the Cape Verde Islands, where, as also in some of the Greater Antilles and in Ascension, it has run wild. Representing the species in South Africa we have the N. coronata, which is very numerous from the Cape Colony to Ovamaland, and the N. cornuta of Drs Finsch and Hartlaub, which replaces it in the west as far as the Zambesi. Madagascar also has its peculiar species, distinguishable by its head and neck. But the N. malaia of Pallas, a name which has often been misapplied to the last. This third Bird has been described by Rodriguez, where it is now found wild. Abyssinia is inhabited by another species, the N. pilorhyncha, which differs from all the foregoing by the absence of any red colouring about the head. Very different from all of them, and the finest species known, is the N. vulturina of Zanzibar, conspicuous by the bright blue in its plumage, the hackles that adorn the lower part of its neck, and its long tail. By some writers it is thought to form a separate genus, Acryllium. All these guineas fowl except the last are common to Europe, having the crown bare of feathers and elevated into a bony "helmet," but the last is a very rare type (it is possible the name Guttero has been given) in which a thick tuft of feathers ornaments the top of the head. This contains four or five species, all inhabiting some part or other of Africa, the best known being the N. cristata from Sierra Leone and other places on the western coast. This bird, apparently mentioned by Marcovaldi more than 200 years ago, but first described by Pallas, is remarkable for the structure—unique, if not possessed by its representative forms—of its furcula, where the head, instead of being the thin plate found in all other Gallinac, is a hollow cup opening upwards, into which the trachea dips, and then emerges on its way to the lungs. Allied to the genus Numida, but readily distinguished therefrom among other characters by the possession of spurs and the absence of a helmet, are two very rare forms, Ageiates and Phasidus, both from western Africa. Of their habits nothing is known. All these birds are beautifully figured in Elliot's Monograph of the Phasianidae, from drawings by Wolf.

GUINEA-WORM (Dracunciliasis), a disease due to the Filaria medinensis, or Dracunculus, or Guineaworm, a filious nematode like a horse-hair, whose most frequent habitat is the subcutaneous and intramuscular tissues of the legs and feet. It is common on the Guinea coast, and in many other tropical and sub-tropical regions and has been familiarly known since ancient times. The condition of dracunculiasis due to it is a very common one, and sometimes amounts to an epidemic. The black races are most liable, but Europeans of almost any social rank and of either sex are not altogether exempt. The worm lives in water, and, like the Filaria sanguinis hominis, appears to have an intermediate host for its larval stage. It is doubtful whether the worm penetrates the skin of the legs directly; it is not impossible that the intermediate host (a cyclopa) which contains the larvae may be swallowed with the water, and that the larvae of the Dracunculus may be set free in the course of digestion.

GUINES, a town in the interior of Havana province, Cuba, about 30 m. S.E. of Havana. Pop. (1907) 8053. It is situated on a plain, in the midst of a rich plantation district, chiefly devoted to the cultivation of tobacco. The first railway in Cuba was built from Havana to Guines between 1835 and 1838. One of the very few good highways of the island also connects Guines with the capital. The palace of Guines, which was built on a great private estate of the same name, dates back to about 1715. The church dates from 1820. Guines became a "villa" in 1814, and was destroyed by fire in 1817.

GUINGAMP, a town of north-western France, capital of an arrondissement in the department of Côtes-du-Nord, on the

right bank of the Trieux, 20 m. W.N.W. of St Brieuc on the railway to Brest. Pop. (1906), town 6937, commune 9212. Its chief church, Notre-Dame de Bon-Secours, dates from the 14th to the 16th centuries; two towers rise on each side of the richly sculptured western portal and a third surmounts the crossing. A famous statue of the Virgin, the object of one of the most important "pardon" or religious pilgrimages in Brittany, stands in one of the two northern porches. The central space is enlivened by a graceful fountain in the Renaissance style, restored in 1743. Remains of the ramparts and of the château of the dukes of Penthièvre, which belong to the 15th century, still survive. Guingamp is the seat of a sub-prefecture and of a tribunal of first instance. It is an important market for dairy-cattle, and its industries include flour-milling, tanning and leather-dressing. Guingamp was the chief town of the countship (subsequently the duchy) of Penthièvre. The Gothic chapel of Grâces, near Guingamp, contains fine sculptures.

GUINNESS, the name of a family of Irish brewers. The firm was founded by Arthur Guinness, who about the middle of the 18th century owned a modest brewing-plant at Leixlip, a village on the upper reaches of the river Liffey. In or about 1759 Arthur Guinness, seeking to extend his trade, purchased a small porter brewery belonging to a Mr. Rainsford at St James's Gate, Dublin. By careful attention to the purity of his product, coupled with a shrewd perception of the public taste, he built up a considerable business. But his third son, Benjamin Lee Guinness (1796-1828), may be regarded as the real maker of the firm, into which he was taken at an early age, and of which about 1825 he was given sole control. Prior to that date the trade in Guinness's porter and stout had been confined to Ireland, but Benjamin Lee Guinness at once established agencies in the United Kingdom, on the continent, in the British colonies and in America. The export trade soon assumed huge proportions; the brewery was continually enlarged, and when in 1835 his father died, Benjamin Lee Guinness, who in 1837 was elected first lord mayor of Dublin, found himself sole proprietor of the business and the richest man in Ireland. Between 1860 and 1865 he devoted a portion of this wealth to the restoration of St. Patrick's cathedral, Dublin. The work, the progress of which he regularly superintended himself, cost £160,000. Benjamin Lee Guinness represented the city of Dublin in parliament as a Conservative from 1865 till his death, and in 1867 was created a baronet. He died in 1868, and was succeeded in the control of the business by Sir Arthur Edward Guinness (b. 1840), his eldest, and Edward Cecil Guinness (b. 1847), his third, son. Sir Arthur Edward Guinness, who for some time represented Dublin in parliament, was in 1880 raised to the peerage as Baron Ardilaun, and about the same time disposed of his share in the brewery to his brother Edward Cecil Guinness. In 1886 Edward Cecil Guinness disposed of the brewery, the products of which were then being sent all over the world, to a limited company, in which he remained the largest shareholder. Edward Cecil Guinness was created a baronet in 1885, and in 1891 was raised to the peerage as Baron Iveagh. The Guinness family have been distinguished for their philanthropy and public munificence. Lord Iveagh gave a recreation ground in Dublin to the public, and his family estates, including Sonning Estate, were sold for the benefit of the nation. Lord Iveagh set aside £250,000 for the creation of the Guinness trust (1890) for the erection and maintenance of buildings for the labouring poor in London and Dublin, and was a liberal benefactor to the funds of Dublin university.

GUINOBATAN, a town of the province of Albay, Luzon, Philippine Islands, on the Inayá river, 9 m. W. by N. of the town of Albay. Pop. (1903), 20,027. Its chief interest is in hemp, which is grown in large quantities in the neighbouring country.

GUIPUZCOA, a maritime province of northern Spain, included among the Basque provinces, and bounded on the N. by the Bay of Biscay; W. by the province of Biscay (Vizcaya); S. and S.E. by Álava and Navarre; and N.E. by the river Bidassoa.1

1 A small island in the Bidassoa, called La Isla de los Faisanes, or l'Isle de la Conférence, is celebrated as the place where the marriage which separates it from France. Pop. (1900), 195,850; area, 728 sq. m. Situated on the northern slope of the great Cantabrian chain at its junction with the Pyrenees, the province has a great variety of surface in mountain, hill and valley; and its scenery is highly picturesque. The coast is much indented, and has numerous harbours, but none of very great importance; the chief are those of San Sebastian, Pasajes, Guetaria, Deba and Urdax in the N., and Guipúzcoa in the W. The rivers (Deba, Urola, Oria, Urumea and Bidassoa) are all short, rapid and unnavigable. The mountains are for the most part covered with forests of oak, chestnut or pine; holly and arbutus are also common, with furze and heath in the poorer parts. The soil in the lower valleys is generally a clay and unfertile; it is cultivated with great care, but the grain raised falls considerably short of what is required for home consumption. The climate, though moist, is mild, pleasant and healthy; fruit is produced in considerable quantities, especially apples for manufacture of cider. The chief mineral products are iron, lignite, lead, copper, zinc and cement. Ferruginous and sulphurous springs are very common, and are much frequented every summer by visitors from all parts of the kingdom. There are excellent fisheries, which supply the neighbouring provinces with cod, tunny, sardines and oysters; and the average yearly value of the coasting trade exceeds £400,000. By Irún, Pasajes and the frontier roads £4,000,000 of imports and £3,000,000 of exports pass and from France, partly in transit for the rest of Europe. Apart from the four Catalan provinces, no province has witnessed such a hard commercial development as Guipúzcoa. The chief centres are Irún, Renteria, Villabona, Vergara and Azpúrtiga for cotton and linen stuffs; Zumarraga for osies; Eibar, Plasencia and Elgoibar for arms and cannon and gold in- crustations; Irún for soap and carriages; San Sebastian, Irún and Onate for paper, glass, chemicals and saw-mills; Tolosa for paper, timber, cloths and furniture; and the banks of the bay of Pasajes for the manufacture of liqueurs of every kind, and the preparation of wines for export and for consumption in the interior of Spain. This last industry occupies several thousand French and Spanish workmen. An arsenal was established at Azpúrtiga during the Carlist rising of 1870-1874; but the manufacture of ordnance and gunpowder was subsequently discontinued. The main line of the northern railway from Madrid to France runs through the province, giving access, by a loop line, to the chief industrial centres. The custom-house which it passes on the frontier is one of the most important in Spain. Despite the steep gradients, where traffic is hardly possible except by ox-carts, there are over 350 m. of admirably engineered roads, maintained solely by the local tax-payers. After San Sebastian, the capital (pop. 13,000), and the chief towns are Fuenterrabía (4345) and Irún (9012). Other towns with more than 6000 inhabitants are Azpúrtiga (6666), Eibar (6583), Tolosa (8111) and Vergara (6106). Guipúzcoa is the smallest and one of the most densely peopled provinces of Spain; for its constant losses by emigration are counterbalanced by a high birth-rate and the influx of settlers from other districts who are attracted by its industrial prosperity.

For an account of its inhabitants and their customs, language and history, see Basques and Basque Provinces.

GUIRAUD, ERNEST (1837-1892), French composer, was born at New Orleans on the 26th of June 1837. He studied at the Paris Conservatoire, where he won the grand prix de Rome. His father had gained the same distinction many years previously, this being the only instance of both father and son obtaining this prize. Ernest Guiraud composed the following operas: Sylvie (1868); Le Rêve d'Elisa (1870); LAIVEN, Piccolino (1878), Galata Aventure (1883), and also the ballet Grems na Green, given at the Opéra in 1873. His opera Frédégonde was left in an unfinished condition and was completed by Camille Saint-Saëns. Guiraud, who was a fellow-student and intimate of the duke of Guinne was arranged between Louis XI. and Henry IV. in 1465, where Francis I., the prisoner of Charles V., was exchanged for his two sons in 1456, and where in 1679 "the Peace of the Pyrenees" was concluded between D. Luis de Haro and Cardinal Mazarin.
friend of Georges Bizet, was for some years professor of composition at the Conservatoire. He was the author of an excellent treatise on instrumentation. He died in Paris on the 6th of May 1892.

GUISBOROUGH, or GISBOROUGH, a market town in the Cleveland parliamentary division of the North Riding of Yorkshire, England, 10 m. E.S.E. of Middlesbrough by a branch of the Cleveland Hills. Pop. of urban district (1901), 5645. It is well situated in a narrow, fertile valley at the N. foot of the Cleveland Hills. The church of St Nicholas is Perpendicular, greatly restored. Other buildings are the town hall, and the modern buildings of the grammar school founded in 1561. Ruins of an Augustinian priory, founded in 1129, are beautifully situated near the eastern extremity of the town. The church contains some fine Decorated work, and the chapter house and parts of the conventual buildings may be traced. Considerable fragments of Norman and transitional work remain. Among the historic personages who were buried within its walls was Robert Bruce, lord of Annandale, the competitor for the throne of Scotland with John Baliol, and the grandfather of King Robert the Bruce. About 1 m. S.E. of the town there is a sulphurous spring discovered in 1822. The district neighbouring to Guisborough is rich in iron-stone. Its working forms the chief industry of the town, and there are also tanneries and breweries.

GUISBOROUGH, HOUSE OF, a cadet branch of the house of Lorraine (q.e.). René II., duke of Lorraine (d. 1508), united the two branches of the house of Lorraine. From his maternal grandmother, Marie d'Harcourt, René inherited the counties of Aumale, Mayenne, Elbeuf, Lillebonne, Brionne and other French siefs, in addition to the honours of the elder branch, which included the countyship of Guise, the dowry of Marie of Blois on her marriage in 1333 with Rudolph or Raoul of Lorraine. René's eldest surviving son by his marriage with Philippa, daughter of Adolphus of Egmont, duke of Gelderland, was Anthony, who succeeded his father as duke of Guisborough by a branch of the d'Harcourt family. His wife was Louise of Savoy ascribed the capture of the place to his efforts; in 1522 he defended northern France, and forced the English to raise the siege of Hesdin; and in 1523 he obtained the government of Champagne and Burgundy, defeating at Neuchâtel the imperial troops who had invaded his province. In 1525 he destroyed the Anabaptist peasant army, which was overrunning Lorraine, at Lupstein, near Saverne (Zabern). On the return of Francis I. from captivity, Guise was erected into a duchy in the peerage of France, though up to this time only princes of the royal house had held the title of duke and peer of France.

Francis, the brother of René, was the last of the line of descendants of the house of Anjou, claimed precedence of the Bourbon princes. Their pretensions and ambitions inspired distrust in Francis I., although he rewarded Guise's services by substantial gifts in land and money. The duchy distinguished itself in the Luxemburg campaign in 1544, but for some years before his death he effaced himself before the growing fortunes of his sons. He died on the 12th of April 1550.

He had been supported in all his undertakings and intrigues by his brother Joyn, cardinal of Lorraine (1498-1550), who had been made condottier at Metz of the age of three. The cardinal was archbishop of Reims, Lyons and Narbonne, bishop of Metz, Toul, Verdun, Thérouanne, Luçon, Albi, Valence, Nantes and Agen, and before he died he squandered most of the wealth which he had derived from these and other benefices. Part of his ecclesiastical prehernements he gave up in favour of his nephews. He became a member of the royal council in 1530, and in 1536 was entrusted with an embassy to Charles V. Although a compliant helper in Francis I.'s pleasures, he was disgraced in 1542, and retired to Rome. He died at Nogent-le-Roi, on the 1st of October 1553. He was sworn in as duke of Guisborough by a branch of the House of Anjou.

Claude of Guise had twelve children, among them Francis, 2nd duke of Guise; Charles, 2nd cardinal of Lorraine (1524-1574), who became archbishop of Reims in 1558 and cardinal in 1547; Claude, marquis of Mayenne, duke of Aumale (1526-1573), governor of Burgundy, who married Louise de Brézé, daughter of Diane de Bourgogne, and had five children, among them the future king Henry IV. (1553-1560), bishop of Troyes, archbishop of Sens and cardinal of Guise; René, marquis of Elbeuf (1536-1556), from whom descended the families of Harcourt, Armagnac, Marsan and Lillebonne; Mary of Lorraine (q.e.), generally known as Mary of Guise, who after the death of her second husband, James V. of Scotland, acted as regent of Scotland for her daughter Mary, queen of Scots; and Francis (1534-1563), grand prior of the order of the Knights of Malta. The solidarity of this family, all the members of which through three generations cheerfully submitted to the authority of the head of the house, made it a formidable factor in French politics.

Francis of Lorraine, 2nd Duke of Guise (1519-1563), "le grand Guise," was born at Bar on the 17th of February 1519. As crown prince of France he served under the French army, and was present at the death of Francis I. at Pavia. He was killed at the siege of Boulogne in 1553, a wound which brought him the name of "Balâfret." Aumale was made (1547) a peerage-duchy in his favour, and on the accession of Henry II. the young duke, who had paid assiduous court to Diane de Poitiers, shared the chief honours of the kingdom with the constable Anne de Montmorency. Both cherished ambitions for their families, but the Guises were more unscrupulous in subordinating the interests of France to their own. Montmorency's brutal manners, however, made enemies where Guise's grace and courtesy made him friends. Guise was a suitor for the hand of Diane d'Albret, Henri, Duke of Navarre, who refused, however, to become a sister-in-law of a daughter of Diane de Poitiers and remained one of the most dangerous and persistent enemies of the Guises. He married in December 1518 Anne of Este, daughter of Ercole II., Duke of Ferrara, and through her mother Renée, a granddaughter of Louis XII. of France. In the same year he had put down a peasant rising in Saintonge with a humanity that compared very favourably with the cruelty shown by Montmorency to the town of Bordeaux. He made preparations in Lorraine for the king's German campaign in 1551-52. He was already governor of Dauphiné, and now became grand chamberlain, prince of Joinville, and hereditary seneschal of Champagne, with large additions to his already considerable revenues. He was charged with the defence of Metz, which Henri II. had entered in 1551. He reached the
city in August 1552, and rapidly gave proof of his great powers as a soldier and organizer by the skill with which he placed; badly fortified and provided with artillery, was put in a state of defence. Metz was invested by the duke of Alva in October with an army of 60,000 men, and the emperor joined his forces in November. An army of brigands commanded by Albert of Brandenburg had also to be reckoned with. Charles was obliged to raise the siege on the 2nd of January 1553, having lost, it is said, 30,000 men before the walls. Guise used his victory with rare moderation and humanity, providing medical care for the sick and wounded left behind in the besiegers' camp. The subsequent operations were paralysed by the king's suspicion and carelessness, and the constable's inactivity, and a year later Guise was removed from the command. He followed the constable's army as a volunteer, and routed the army of Charles V, at the siege of Renty on the 12th of August 1554. Montmorency's inaction rendered the victory fruitless, and a bitter controversy followed between Guise and the constable's nephew Coligny, admiral of France, which widened a breach already existing.

The conclusion of a six years' truce at Vaucelles (1556) disappointed Guise's ambitions, and he was the main mover in the breach of the treaty in 1558, when he was sent at the head of a French army to Italy to the assistance of Pope Paul IV against Soderini, who perhaps had in view the restoration to his family of the Angevin dominion of Naples and Sicily, crossed the Alps early in 1557 and after a month's delay in Rome, where he failed to receive the promised support, marched on the kingdom of Naples, then occupied by the Spanish troops under Alva. He seized and sacked Campi (April 17th), but was compelled to raise the siege of Civitella. Meanwhile the pope had veered round to a Spanish alliance, and Guise, seeing that no honour was to be gained in the campaign, wisely spared his troops, so that his army was most intact when, in August, he hastily summoned home to repel the Spanish army which had invaded France from the north, and had taken St Quentin. On reaching Paris in October Guise was made lieutenant-general of the kingdom, and proceeded to prepare for the siege of Calais. The town was taken, after six days' fighting, on the 6th of January 1558, and this success was followed up by the capture of Guines, Thionville and Arlon, when the war was ended by the treaty of Cateau Cambresis (1559). Although his brother, the cardinal of Lorraine, was one of the negotiators, this peace was concluded against the wishes of Guise, and was regarded as a triumph of the constable's party. The Guises were provided with a weapon against Montmorency by the bishop of Arras (afterwards Cardinal Granvelle), who gave to the cardinal of Lorraine at an interview at Péronne in 1558 an intercepted letter proving the Huguenot leanings of the constable's nephews.

On the accession in 1559 of Francis II., their nephew by marriage with Mary Stuart, the royal authority was practically delegated to Guise and the cardinal, who found themselves beyond rivalry for the time being. They had, however, to cope with a new and dangerous force in Catherine de' Medici, who was now for the first time free to use her political ability. The incapacity, suspicion and cruelty of the cardinal, who controlled the internal administration, roused the smaller nobility against the Lorraine princes. A conspiracy to overturn their government was formed at Nantes, with a needy Périgord nobleman named La Renaudie as its nominal head, though the agitation had in the first instance been fostered by the agents of Louis I., prince of Condé. The Guises were warned of the conspiracy while the court was at Blois, and for greater security removed the king to the safety of Orleans; and was Regarded as a triumph of the merely postponed his plans; and the conspirators assembled in small parties in the woods round Amboise. They had, however, been again betrayed and many of them were surrounded and taken before the coup could be delivered; one party, which had seized the château of Noizay, surrendered on a promise of amnesty given "on his faith as a prince " by James of Savoy, duke of Nemours, a promise which, in spite of the duke's protest, was disregraded. On the 19th of March 1560, La Renaudie and the rest of the conspirators openly attacked the château of Amboise. They were repelled; their leader was killed; and a large number were taken prisoners. The merciless vengeance of the Guises was the measure of their previous fears. For a whole week the torturings, quarterings and hangings went on, the bodies being cast into the Loire, the young king and queen witnessing the bloody spectacle day by day from a balcony of the château.

The cruel repression of this " conspiracy of Amboise " inspired bitter hatred of the Guises, since they were avenging a rising rather against their own than the royal authority. They now entrenched themselves with the king at Orleans, and the Bourbon princes, Anthony, king of Navarre, and his brother Condé were summoned to meet at the colloquy of Poissy in 1561, but the affair was postponed by the chancellor, and the death of Francis II. in December saved Condé. Guise then made common cause with his old rival Montmorency and with the Marshal de Saint André against Catherine, the Bourbons and Coligny. This alliance, constituted on the 6th of April 1561, and known as the triumvirate, aimed at the annulment of the concessions made by Catherine to the Huguenots. The cardinal of Lorraine fomented the discord which appeared between the clergy of the two religions when they met at the colloquy of Poissy in 1561. But in spite of the extreme Catholic views he there professed, he was at the time in communication with the Lutheran princes of Germany, and in February 1562 met the duke of Württemberg at Zabern to discuss the possibility of a religious compromise.

The signal for civil war was given by an attack of Guise's escort on a Huguenot congregation at Vassy (1st of March 1562). Although Guise did not initiate the massacre, and although, when he learned what was going on, he even tried to restrain his soldiers, he did not disavow their action. When Catherine de' Medici forbade his entry into Paris, he accepted the challenge, and on the 16th of March he entered the city, where he was a popular hero, at the head of 20,000 armed nobles. The provost of the merchants offered to put 20,000 men and two million livres at his disposal. In September he joined Montmorency in besieging Rouen, which was sacked as if it had been a foreign city, in spite of Guise's efforts to save it from the worst horrors. At the battle of Dreux (19th of December 1562) he commanded a reserve army, with which he saved Montmorency's forces from destruction and inflicted a crushing defeat on the Huguenots. The prince of Condé was his prisoner, while the capture of Montmorency by the Huguenots and the assassination of the Marshal de Saint-André after the battle left Guise the undisputed head of the Catholic party. He was appointed lieutenant-general of the kingdom, and on the 5th of February 1563 he appeared with his army before Orleans. On the 19th, however, he was shot by the Huguenot Jean Poltrot de Mérè as he was returning to his quarters, and died on the 24th of the effects of the wound. Guise's splendid presence, his generosity and humanity and his almost unvarying success on the battlefield made him the idol of his soldiers. He attended personally to the minutest details, and Monluc complains that he even wrote out his own orders. The mistakes and cruelties associated with his name were partly due to the evil counsels of his brother Charles, the cardinal, whose cowardice and insincerity were the scorn of his contemporaries. The negotiations of the Guises with Spain dated from the interview with Granvelle at Péronne, in 1558, and after the death of his brother the cardinal of Lorraine was constantly in communication with the Spanish court, offering, in the event of the failure of direct heirs to the Valois kings, to deliver up the French fortresses and to acknowledge Philip II. as King of France. His death in 1574 temporarily weakened the extreme Catholic party.

Of the children of Francis, "le Balafre" five survived him: Henry, 3rd duke of Guise; Charles, duke of Mayenne (1554-1611) (q.v.), who consolidated the League: Catherine (1552-1596), who married Louis XIII.; Louis, 2nd duke of Guise (1569-1588), who married one of the Parisian leaguers; Louis, second cardinal of Guise, afterwards of Lorraine (1555-1588), who was assassinated with his brother Henry; and Francis (1538-1573).
HENRY OF LORRAINE, 3rd duke of Guise (1550-1588), born on the 31st of December 1550, was thirteen years old at the time of his father's death, and grew up under the domination of a passionate desire for revenge. Catherine de' Medici refused to take steps against Coligny, who was formally accused by the duchess of Guise and her brothers-in-law of having incited the mob in 1566 by insisting on a formal reconciliation at Moulins between the Guises and Coligny, at which, however, none of the sons of the murdered man was present. Henry and his brothers were, however, compelled in 1572 to sign an ambiguous assent to this agreement. Guise's widow married James of Savoy, duke of Nemours, and the young duke at sixteen went to fight against the Turks in Hungary. On the fresh outbreak of civil war in 1567 he returned to France and served under his uncle, the amiral. In the autumn of 1568 he received a considerable command, and speedily came into rivalry with Henry of Valois, duke of Anjou. He had not inherited his father's generalship, and his rashness and headstrong valour more than once brought disaster on his troops, but the showy quality of his fighting brought him great popularity in the army. In the defence of Poitiers in 1569 with his brother, the duke of Mayenne, he showed more solid abilities as a soldier. On the conclusion of peace in 1570 he returned to court, where he made no secret of his attachment to Margaret of Valois. His pretensions were violently resisted by her brothers, who threatened his life, and he saved himself by a precipitate marriage with Catherine of Cleves (daughter of John, duke of Cleves, and Mary, daughter of Louis of Bourbon), the widow of a Huguenot nobleman, Antoine de Crog, prince of Porcien. Presently he ended his disgrace by an apparent reconciliation with Henry of Valois and an alliance with Catherine de' Medici. He was an accomplice in the first attack on Coligny's life, and when permission for the massacre of Saint Bartholomew was extorted from Charles IX. he roused Paris against the Huguenots, and satisfied his personal vengeance by superintending the murder of Coligny. He was now the acknowledged chief of the Catholic party, and the power of his family was further increased by the marriage (1573) of Henry III. with Louise of Vaudémont, who belonged to the elder branch of the house of Lorraine. In a fight at Dormans (10th of October 1572), the only Catholic victory in a disastrous campaign, Guise received a face wound which won for him his father's name of Balafre and helped to secure the passionate attachment of the Parisians. He refused to acquiesce in the treaty of Beaulieu (5th of May 1576), and with the support of the Jesuits proceeded to form a "holy league" for the defence of the Roman Catholic Church. The terms of enrolment enjoined offensive action against all who refused to join. This had been already attempted by various provincial leagues among the Catholics, notably one at Pérone. Condé had been imposed on this town as governor by the terms of the peace, and the local nobility banded together to resist him. This, like the Holy League itself, was political as well as religious in its aims, and was partly inspired by revolt against the royal authority. In the direction of the League Guise was hampered by Philip of Spain, who subsidized the movement, while he also had to submit to the dictation of the Parisian democracy. Ulterior ambitions were freely ascribed to his purpose. In 1572, at 4th of August, he went to Reims. Jean David, revealed a definite design of substituting the Lorrainers, who represented themselves as the successors of Charlemagne, for the Valois; but these papers were probably a Huguenot forgery. Henry III. eventually placed himself at the head of the League, and resumed the war against the Huguenots; but on the conclusion of peace (September 1577) he seized the opportunity of disbanding the Catholic associations. The king's jealousy of Guise increased with the duke's popularity, but he did not venture on an open attack, nor did he dare to avenge the murder by Guise's partisans of another of Francis of Cleves, Saint-Mégrin, who had been set on by the court to compromise the reputation of the duchess of Guise.1

Meanwhile the duke had entered on an equivocal alliance with Don John of Austria. He was also in constant correspondence with Mary of Lorraine, and meditated a descent on Scotland in support of the Catholic cause. But the great riches of the Guises were being rapidly dissipated, and in 1578 the duke became a pensioner of Philip II. When in 1584 the death of the duke of Anjou made Henry III. heir to the throne, the prospect of a Huguenot dynasty roused the Catholics to forget their differences, and led to the formation of a new league of the Catholic nobles. At the end of the same year Guise and his brother, the duke of Mayenne, with the assent of other Catholic nobles, signed a treaty at Joinville with Philip II., fixing the succession to the crown on Charles, cardinal of Bourbon, to the exclusion of the Protestant princes of his house. In March 1585 the chiefs of the League issued the Declaration of Pérone, exposing their grievances against the government and announcing their intention to restore the dignity of religion by force of arms. On the refusal of Henry III. to accept Spanish help against his Huguenot subjects, war broke out. The chief cities of France declared for the League, and Guise, who had recruited his forces in Germany and Switzerland, took up his headquarters at Châlons, while Mayenne occupied Dijon, and his relatives, the dukes of Elbeuf, Amale and Mercœur,2 roused Normandy and Brittany. Henry III. accepted, or feigned to accept, the terms imposed by the Guises at Nemours (7th of July 1585). The edicts in favour of the Huguenots were immediately revoked. Guise, who had been made, in 1582, a prince of the church, and who in 1584 had defeated the German auxiliaries of the Huguenots at Vimory (October 1584) and Auneau (November 1587), the protestations of loyalty to Henry III. which had marked the earlier manifestations of the League were modified. Obedience to the king was now stated to depend on his giving proof of Catholic zeal and showing no favour to heresy. In April 1588 Guise arrived in Paris, where he put himself at the head of the Parisian mob, and on the 12th of May, known as the Day of the Barricades, he actually had the crown within his grasp. He refused to treat with Catherine de' Medici, who was prepared to make peace at any cost, but restrained the popular storm from resolution and permitted Henry to escape from Paris. Henry came to terms with the League in May, and made Guise lieutenant-general of the royal armies. The League, generally, which were assembled at Blois, were devoted to the Guise interest, and alarmed the king by giving voice to the political as well as to the religious aspirations of the League. Guise remained at the court of Blois after receiving repeated warnings that Henry meditated treason. On the 25th of December he was summoned to the king's chamber during a sitting of the royal council, and was murdered by Cogóes. At the end of December 1588 the pretender of Lorraine was murdered in prison on the next day. The history of the Guises thenceforward centres in the duke of Mayenne (q.v.).

By his wife, Catherine of Cleves, the third duke had fourteen children: among them Charles, 4th duke of Guise (1571-1640); Claude, duke of Chevreuse (1578-1657), whose wife, Marie de Rohan, duchess of Chevreuse, became famous for her intrigues; Louis (1585-1621), 3rd cardinal of Guise, archbishop of Reims, remembered for his liaison with Charlotte des Essarts, mistress of Henry IV.; Alexandre-Emmanuel (1568-1640), imprisoned for three years after his father's death. He married Henriette Catherine de Joyeuse, widow of the duke of Montpensier. His eldest son predeceased him, and he was succeeded by his second son Henry (1614-1664), who had been archbishop of Reims, but renounced the ecclesiastical estate and became 5th duke. He made an attempt (1647) on the crown of Naples, and was a prisoner in Spain from 1648 to 1652. A second expedition to Naples in 1654 was a failure. He was succeeded by his nephew, Louis Joseph (1656-1671), as 6th duke. With his son, Jean Joseph (1670-1703), the line failed; and the title and estates passed to his great-aunt, Marie of Lorraine, duchess of Guise.

1 This incident supplied Alexandre Dumas père with the subject of his Henri III et son cour (1829).

2 Philippe-Emmanuel of Lorraine, duke of Mercœur, a cadet of Lorraine and brother of Louise de Vaudemont, Henry III.'s queen. His wife, Mary of Luxembourg, descended from the dukes of Cleves and Cleves, and he was made governor of the province in 1582. He aspired to separate sovereignty, and called his son prince and duke of Brittany.
GENEALOGICAL TABLE OF THE HOUSE OF GUISE

René II. (who united the two branches of the house of Lorraine), duke of Lorraine, and Philippa of Gelderland, had (besides two older boys who died in childhood, and four unmarried daughters)

Antoine, duke of Lorraine, ancestor of the dukes of Lorraine and the house of Merceur.

Claude, 1st duke of Guise, =Antoinette of Bourbon.

John, 1st cardinal of Lorraine.

Perri, killed at Marignano.

Louis, killed at Naples.

Francis, killed at Pavia.

Francis, 2nd duke of Guise, =Anne of Este.

Charles, 2nd cardinal of Lorraine, 1st cardinal of Guise, =Louise de Brézé.

Claude, marquis of Mayenne and duke of Aumale, t1573.

Louis, grand prior, t1578.

Charles, duke of Elbeuf, t1564.

Marie = Mary Stuart, queen of Scots.

Rene = (1) duke of Longueville, (2) James V. of Scotland.

And five others.

Henry, 3rd duke, t1558 = Catherine of Cleves (and had 14 children).

Charles, duke of Mayenne, t1611.

Henry, duke of Mayenne, t1621.

Louis, 2nd cardinal of Guise, t1588.

Catherine = Louis de Bourbon, duke of Montpensier.

And five others.

Charles, 4th duke of Guise, t1640.

Claude, duke of Chevreuse, =Marie de Rohan, widow of the duke of Luynes.

Louis, 3rd cardinal of Guise, t1621.

And eleven more.

Henry, archbishop of Reims, and 5th duke, t1664.

Marie, called Mlle. de Guise, succeeded to the duchy in 1675 and sold her rights to Louis Augustus, duke of Maine.

Louis, chevalier of Guise and duke of Joyeuse, t1654.

Louis-Joseph, 6th duke of Guise, t1671.

Francis-Joseph, 7th and last duke of Guise, t1675.

And eight more.
The paramount See the long both is of See states musica the of afforded construction imparare Hist, alfabeto sassinat were Series) especially by in instruments A Memoires 1681), Paris, 1558) de diaries of the Guise, which were included in the Guise, accounts of the government, Guise, accounts of the Guise; vol. xi. accounts of the Parisian revolution of 1558; and vol. xii. numerous pamphlets and pieces dealing with the murder of Henry of Guise and his brother. An account of the murder of Guise and accounts of the government, which was supplied by the Venetian ambassador, G. Mocenigo, to his government, is printed by H. Brown in the Eng. Hist, Res. (April 1833). For the foreign policy of the Guises, and especially their relations with Scotland, there is abundant material in the English Calendar of State Papers of Queen Elizabeth (Foreign Series) and in the correspondence of Cardinal Granvelle. The memoirs of Francis, duke of Guise, covering the years 1547 to 1563, were published by Michel et Poujoulat in series 1, vol. iv. of their Coll. de mémoires. Among contemporary memoirs see especially those of the prince of Conde, of Plaisce de Monluc and of Gaspard de Saulx-Touvet, Duc de la Guise (Paris, 1681), by J. B. H. du Tronset de Valincourt; A. de Ruble, L’Asassinal de F. de Lorraine, duc de Guise (1807), where there is a list of the U.S. sources available for a history of the house: R. de Bouille, Hist. des ducs de Guise (4 vols., 1849); H. Forneron, Les Guise et leur époque (2 vols., 1887).

**GUITAR** (Fr. guitare, Ger. Gitarre, Ital. chitarra, Span. guitarra), a musical instrument strung with gut strings twanged by the fingers, having a body with a flat back and graceful incursions in complete contrast to the members of the family of lute (q.v.), whose back is vaulted. The construction of the instrument is of paramount importance in assigning to the guitar its true position in the history of musical instruments, midway between the cithara (q.v.) and the violin. The medieval stringed instruments with neck fall into two classes, characterized mainly by the construction of the body: (1) Those which, like their archetype the cithara, had a body composed of a flat or delicately arched back and soundboard joined by ribs. (2) Those which, like the lyre, had a body consisting of a vaulted back over which was glued a flat soundboard without the intermediary of ribs; this method of construction predominates among Oriental Instruments and is greatly inferior to the latter. A striking proof of this inferiority is afforded by the fact that instruments with vaulted backs, such as the rebab or rebec, although extensively represented during the middle ages in all parts of Europe by numerous types, have shown but little or no development during the course of some twelve centuries, and have dropped out one by one from the realm of practical music without leaving a single survivor. The guitar must be referred to the first of these classes.

The back and ribs of the guitar are of maple, ash or cherry-wood, frequently inlaid with rose-wood, mother-of-pearl, tortoise-shell, &c., while the soundboard is of pine and has one large ornamental rose sound hole. The bridge, to which the strings are fastened, is of ebony with an ivory nut which determines the one end of the vibrating strings, while the nut at the end of the fingerboard determines the other. The neck and fingerboard are made of hard wood, such as ebony, beech or pear.

The head, bent back from the neck at an obtuse angle contains two parallel barrels or long holes through which the strings pass, a screw, or short, three or four. The correct positions for stopping the intervals are marked on the fingerboard by little metal ridges called frets. The modern guitar has six strings, three of gut and three of silk covered with silver wire, tuned as shown. To the thumb are assigned the three deepest strings, while the first, second and third fingers are used to twang the highest strings. It is generally stated that the sixth or lowest string was added in 1790 by Jacob August Otto of Jena, who was the first in Germany to take up the construction of guitars after their introduction from Italy in 1788 by the Duchess Amalie of Weimar. Otto states that he was a Capellmeister Naumann of Dresden who requested him to make him a guitar with six strings by adding the low E, a spun wire string. The original guitar brought from Italy by the duchess Amalie had five strings, the lowest A being the only one covered with wire. Otto also covered the D in order to increase the fulness of the tone. In Spain six-stringed guitars and vihuelas were known in the 16th century; they are described by Juan Bermudo and others. The lowest string was tuned to G. Other Spanish guitars had four, five or seven strings or courses of strings in pairs of unisons. They were always twanged by the fingers.

The guitar is derived from the cithara both structurally and etymologically. It is usually assumed that the cithara was introduced into Spain by the Arabs, but this statement is open to the gravest doubts. There is no trace among the instruments of the Arabs known to us of any similar to the guitar in construction and appearance, although a guitar (fig. 2) with slight incursions was known to the ancient Egyptians. The ancient Greeks had a three-sting instrument, the lyre, and the lyre was lengthened, the cord was tuned with ribs and incursions and a long neck provided with numerous frets, on a Hittite bas-relief on the dromos at Euyuk (c. 1000 B.C.) in Cappadocia. Unless otherwise of much later date should come to light showing guitars with ribs, we shall be justified in assuming that the guitar must have come to Spain in construction, died out in Egypt and in Asia before the days of classic Greece, and had to be evolved anew from the cithara by the Greeks of Asia Minor. That the evolution of the guitar should take place within the Byzantine Empire or in Syria would be quite consistent with the tenets of the Greeks and their veneration for the cithara, which would lead them to add to the neck and the other improvements to it, rather than adopt the rebab, the tambur or the barbaton from the Persians or Arabs. This is, in fact, what seems to have taken place. It is true that in the 14th century in an enumeration of musical instruments by the Archiprète de Hita, a guitarra morisca is mentioned and unfavourably compared with the guitarra latais; moreover, the Arabs of the present day still use an instrument called kisra (which in N.Africa would be guitarra), but it has a vaulted back, the body being like half a pear with a long neck: the strings are twanged by half a guill. The Arab instrument therefore belongs to a different type and the position of the instrument as the ancestor of the Spanish guitar would be tantamount to deriving the guitar from the lutæ.

By no means altogether so. Characteristic words given by Spanish writers, we obtain a clue to the identity of the medieval instruments, which, in the absence of absolute proof, is entitled to serious consideration. From Bermudo's work, quoted above, we learn that the guitarra morisca and the guitarra latais were twanged only in accordance and occasionally in the number of strings. Three kinds of vihuelas were known in Spain during the middle ages, distinguished by the qualifying phrases de arco (with bow), de mano (by hand), de pena (with quill). Spanish scholars have inquired into this question of identity state that the guitarra latais was afterwards known as the vihuela de mano, a statement fully supported by

other evidence. As the Arab kithira was known to be played by means of a quill, we shall not be far wrong in identifying it with the rišīka da ṭīla. The word rišīka or rišīla is connected with the Latin fidicula or fides, a stringed instrument mentioned by Cicerō as being made from the wood of the plane-tree and having many strings. The remaining link in the chain of identification is afforded by St. Ferdinand, bishop of Seville in the 7th century, who states that fidicula was another name for cithara, "Vetere aut cithararum fidicula vel fidicula, unaque maxevaetur," the fidicula therefore was the cithara, either in its original classical form or in one of the transitions which transformed it into the guitar. The existence of a superior guitarra latina side by side with the guitarra morisca is thus explained. It was derived directly from the classical cithara introduced through the East; and in Spain, the architecture of the structural beauty which formed the basis of the perfect proportions and delicate structure of the violin. In an inventory made by Philip van Welden of the musical instruments which had belonged to Henry VIII., is the following item bearing on the question: "Vaur, gittern with three strings: there was a notation of this time until the middle of the 19th century the guitar enjoyed great popularity on the continent, and became the fashionable instrument in England after the Peninsular War, mainly through the virtuosity of Ferdinand Sor, who also wrote compositions for it. This popularity of the guitar was due to its merits as a solo instrument than to the ease with which it could be mastered sufficiently to accompany the voice. The Flatatik in the Spanish guitar in England led to the use of the popularity of the cittern, also known at that time in contradistinction as the English or wire-string guitar, although the two instruments differed in many particulars. As further evidence of the great popularity of the guitar all over Europe may be instanced the extraordinary number of books extant on the instrument, giving instructions how to play the guitar and read the tablature.

(K. S.)

GUITAR FIDDLE (Troubadour Fiddle), a modern name bestowed retrospectively upon certain precursors of the violin possessing characteristics of both guitar and fiddle. The name "guitar fiddle" is intended to emphasize the fact that the instrument in the shape of the guitar, which during the middle ages represented the most perfect principle of construction for stringed instruments with necks, adopted at a certain period the use of the bow from instruments of a less perfect type, the rebab and its hybrids. The use of the bow with the guitar entailed certain constructive changes in the instrument: the large central rose sound-hole was replaced by lateral holes of various shapes; the flat bridge, suitable for instruments whose strings were plucked, gave place to the arched bridge required in order to enable the bow to vibrate each string separately; the arched bridge, from raising the strings higher above the sound-board, made the stopping of the strings on the neck extremely difficult if not impossible; this matter was adjusted by the addition of a finger-board of suitable shape and dimensions (fig. 1). At this stage the guitar fiddle possesses the essential features of

Fig. 3.—Instrumentalists from the Utrecht Psalter, 9th century: (a) The bass rota, first transition of cithara in (C); (b, c, d), showing the addition of neck to the body of the cithara.

The Psalter, psalm by psalm. It is evident that the Anglo-Saxon artist, while endowed with extraordinary talents and a vivid imagination, drew his inspiration from an older Greek illustrated Psalter from the Christian East, where the evolution of the guitar took place.

One of the earliest representations (fig. 4) of a guitar in Western Europe occurs in a Passional from Zwolena AD 1180, now in the Royal Library at Stuttgart.

St Pelagia seated on an ass holds a rota, or cithara in transition, while one of the men-servants leading the animal. Both instruments have three strings and the characteristic guitar outline with incurvations, the rota differing in having no neck. Mersemser, writing early in the 17th century describes and figures the Spanish guitars, one with four, the other with five strings; the former had a cittern head, the latter the straight head bent back at an obtuse angle from the neck, as in the modern instrument; he gives the Italian, French and Spanish tablatures which would show that the guitar already enjoyed a certain vogue in France and Italy as well as in Spain.

Fig. 4.—Presentation of a European Guitar. AD 1180.
GUITRY—GUIZOT

Ahmad, the Abbasid (862—886). The instrument, a citron with four strings, is being played by a bear. Other examples occur in the Stuttgart Carolingian Psalter 10 (10th century); in MS. 1250 (Bibl. Imp. Paris) Tristia and Ysulit; as guitar fiddle in the Liber Regalis Westminster; in the Codex Aureus of St. Gall; in the Solesmes Book 14 (1444—1476), the Book of Hours executed for Bona of Savoy, wife of Galeazzo Maria Sforza; on one of the carvings of the 15th century in the Cathedral of Chartres; and it has also been painted by Italian artists of the 15th and 16th centuries.

GUITRY, LUCIEN GERMAIN (1860— ). French actor, was born in Paris. He became prominent on the French stage at the Porte-Saint-Martin theatre in 1900, and the Variétés in 1901, and then became a member of the Comédie Française, but he resigned very soon in order to become director of the Renaissance, where he was principally associated with the actress Marthe Brandès, who had also left the Comédie. Here he established his reputation, in a number of plays, as the greatest contemporary French actor in the drama of modern reality.

GUIZOT, FRANÇOIS PIERRE GUILLAUME (1787—1874), historian, orator and statesman, was born at Nîmes on the 4th of October 1782, of an honourable Protestant family belonging to the bourgeoisie of that city. It is characteristic of the cruel disabilities which still weighed upon the Protestants of France before the Revolution, that his parents, at the time of their union, could not be publicly or legally married by their own pastors, and that the ceremony was clandestine. The liberal opinions of his family did not, however, save it from the sanguinary intolerance of the Reign of Terror, and on the 8th April 1794 his father perished at Nîmes upon the scaffold. Thenceforth the education of the future minister and devolved entirely upon his mother, a woman of slight appearance and of homely manners, but endowed with great strength of character and clearness of judgment. Madame Guizot was a living type of the Huguenots of the 17th century, stern in her principles and her faith, immovable in her convictions and her sense of duty. She formed the character of her illustrious son and shared every vicissitude of his life. In the days of his power her simple figure, always clad in deep mourning for her martyred husband, was not absent from the splendid circle of his political friends. In the days of his exile in 1848 she followed him to London, and there at a very advanced age closed her life and was buried at Kensal Green. Driven from Nîmes by the Revolution, Madame Guizot and her son repaired to Geneva, where he received his education. In spite of her decided Calvinistic opinions, the theories of Rousseau, then much in fashion, were not without their influence on Madame Guizot. She was a strong Liberal, and she even adopted the notion inculcated in the Émile that every man ought to learn a manual trade or craft. Young Guizot was taught to be a carpenter, and he so far succeeded in his work that he made a table for his own hands, and an armchair, which his father, who did not much love literature, passed on to his son. Guizot's other studies little is known, for in the work which he entitled Mémoires of my own Time Guizot omitted all personal details of his earlier life. But his literary attainments must have been precocious and considerable, for when he arrived in Paris in 1805 to pursue his studies in the faculty of laws, he entered at eighteen as tutor into the family of M. Stapfer, formerly Swiss minister in France, and he soon began to write in a journal edited by M. Suard, the Publiciste. This connexion introduced him to the literary society of Paris. In October 1809, being then twenty-two, he wrote a review of M. de Chateaubriand's Martin Chastiges, which procured for him the approbation and cordial thanks of that eminent person, and he continued to contribute largely to the periodical press. At Suard's he had made the acquaintance of Pauline Meulan, an accomplished lady of good family, some fourteen years older than himself, who had been forced by the hardships of the Revolution to earn her living by literature, and who also was engaged to contribute a series of articles to Suard's journal. These contributions were

interrupted by her illness, but immediately resumed and continued by an unknown hand. It was discovered that François Guizot had quietly supplied the deficiency on her behalf. The acquiescence thus begun ripened into friendship and love, and in 1812 Mademoiselle de Meulan consented to marry her youthful ally. She died in 1827; she was the author of many esteemed works on female education. An only son, born in 1810, died in 1837 of consumption. In 1828 Guizot married Elisa Dillon, niece of his first wife, and also an author. She died in 1833, leaving a son, Maurice Guillaume (1833-1892), who attained some reputation as a scholar and writer.

During the empire, Guizot, entirely devoted to literary pursuits, published a collection of French synonyms (1809), an essay on the fine arts (1811), and a translation of Gibbon with additional notes in 1812. These works recommended him to the notice of M. de Fontanes, then grand-master of the university of France, who selected Guizot for the chair of modern history at the Sorbonne in 1812. His first lecture (which is reprinted in his Memoirs) was delivered on the 11th of December of that year. The customary compliment to the all-powerful emperor, he declined to insert in it, in spite of the hints given him by his patron, but the course which followed marks the beginning of the great revival of historical research in France in the 19th century. He had now acquired a considerable position in the society of Paris, and the friendship of Royer-Collard and the leading members of the liberal party, including the young duc de Broglie. Absent from Paris at the moment of the fall of Napoleon in 1814, he was at once selected, on the recommendation of Royer-Collard, to serve the government of Louis XVIII. in the capacity of secretary-general of the ministry of the interior, under the abbe de Montesquieu. Upon the return of Napoleon from Elba he immediately resigned, on the 29th of March 1815 (the statement that he retained office under General Carnot is incorrect), and returned to his literary pursuits. After the Hundred Days, he repaired to Ghent, where he saw Louis XVIII., and in the name of the liberal party pointed out to his majesty that a frank adoption of a liberal policy could alone secure the duration of the restored monarchy—advice which was ill-received by M. de Blacas and the king's confidential advisers. This visit to Ghent, at the time when France was a prey to a second invasion, was made a subject of bitter reproach to Guizot in after life by his political opponents, as an unpatriotic action. “The Man of Ghent” was one of the terms of insult frequently hurled against him in the days of his power. But the reproach appears to be wholly unfounded. The true interests of France were not in the defence of the falling empire, but in establishing a liberal policy on a monarchical basis and in combating the reactionary tendencies of the ultra-royalists. It is at any rate a remarkable circumstance that a young professor of twenty-seven, with none of the advantages of birth or political experience, should have been selected to convey so important a message to the ears of the king of France, and a proof, if any were wanting, that the Revolution had, as Guizot said, “done its work.”

On the second restoration, Guizot was appointed secretary-general of the ministry of justice under M. de Barbé-Marbois, but resigned with his chief in 1816. Again in 1819 he was appointed general director of communes and departments in the ministry of the interior, but lost his office with the fall of Decazes in February 1820. During these years Guizot was one of the leaders of the Doctrinaires, a small party strongly attached to the charter and the crown, and advocating a policy which has become associated (especially by Faguet) with the name of Guizot, that of the juste milieu, a via media between absolutism and popular government. Their opinions had more of the rigour of a sect than the elasticity of a political party. Adhering to the great principles of liberty and toleration, they were sternly opposed to the anarchical traditions of the Revolution. They knew that the elements of anarchy were still fermenting in the country, and they hoped that the moderate measures, but by the firm application of the power of a limited constitution, based on the suffrages of the middle class and defended by the highest literary talent of the times. Their motives were honourable. Their views were philosophical. But they were opposed alike to the democratic spirit of the age, to the military traditions of the empire, and to the bigotry and absolutism of the court. The fate of such a party might be foreseen. They lived by a policy of resistance; they perished by another revolution (1830). They are remembered more for their constant opposition to popular demands than by the services they undoubtedly rendered to the cause of temperate freedom.

In 1820, when the reaction was at its height after the murder of the duc de Berri, and the fall of the ministry of the duc Decazes, Guizot was deprived of his offices, and in 1822 even his course of lectures were interrupted. During the succeeding years he played an important part among the leaders of the liberal opposition to the government of Charles X., although he had not yet entered parliament, and this was also the time of his greatest literary activity. In 1822 he had published his lectures on representative government (Histoire des origines du gouvernement représentatif, 1821-1822, 2 vols.; Eng. trans. 1823); also a work on capital punishment for political offences and several important pamphlets. From 1822 to 1830 he published two important collections of historical sources, the memoirs of the history of England in 26 volumes, and the memoirs of the history of France in 31 volumes, and a revised translation of Shakespeare, and a volume of essays on the history of France. The most remarkable work from his own pen was the first part of his Histoire de la révolution d'Angleterre depuis Charles Ier à Charles II. (2 vols., 1826-1827; Eng. trans., 2 vols., Oxford, 1838), a book of great merit and impartiality, which he resumed and completed during his exile in England after 1848. The Martignac administration restored Guizot in 1828 to his professor's chair and to the council of state. Then it was that he delivered the celebrated courses of lectures which raised his reputation as an historian to the highest point of fame, and placed him amongst the best writers of France and of Europe. These lectures formed the basis of his general Histoire de la civilisation en Europe (1828; Eng. trans. by W. Hazlitt, 3 vols., 1840), and of his Histoire de la civilisation en France (4 vols., 1830), works which must ever be regarded as classics of modern historical research. Hitherto Guizot's fame rested on his merits as a writer on public affairs and as a lecturer on modern history. He had attained the age of forty-three before he entered upon the full display of his oratorical strength. In January 1830 he was elected for the first time by the town of Lisieux to the chamber of deputies, and he retained that seat during the whole of his political life. Guizot immediately assumed an important position in the representative assembly, and the first speech he delivered was in defence of the celebrated address of the king, in answer to the menacing speech from the throne, which was followed by the dissolution of the chamber, and was the precursor of another revolution. On his returning to Paris from Nîmes on the 27th of July, the fall of Charles X. was already imminent. Guizot was called upon by his friends Casimir-Périer, Laffitte, Villemain and Dupin to draw up the protest of the liberal deputies against the royal ordinances of July, whilst he applied himself with them to control the revolutionary character of the late contest. Personally, Guizot was always of opinion that it was a great misfortune for the cause of parliamentary government in France that the infatuation and iniquity of Charles X. and Prince Polignac rendered a change in the hereditary line of succession inevitable. But, though convinced that it was inevitable, he became one of the most ardent supporters of Louis-Philippe. In August 1830 Guizot was made minister of the interior, but resigned in November. He had now passed into the ranks of the conservatives, and for the next eighteen years was the most determined foe of democracy, the unyielding champion of "a monarch" limited by a limited number of bodies, not an aristocracy...
the summer of that year was marked by a formidable republican rising in Paris, and it was not till the 11th of October 1832 that a stable government was formed, in which Marshal Soult was first minister, the duc de Broglie took the foreign office, Thiers the home department, and Guizot the department of public instruction. This ministry, which lasted for nearly four years, was buried by Louis Philippe. Guizot, however, was already marked with the stigma of unpopularity by the more advanced liberal party. He remained unpopular all his life, "not," said he, "that I court unpopularity, but that I think nothing about it." Yet never were his great abilities more useful to his country than whilst he filled this office of secondary rank but of primary importance in the department of public instruction. The duties it imposed on him were entirely congenial to his literary tastes, and he was master of the subjects they concerned. He applied himself in the first instance to carry the law of the 28th of June 1833, and then for the next three years to put it into execution. In establishing and organizing primary education in France, this law marked a distinct epoch in French history. In fifteen years, under its influence, the number of primary schools rose from ten to twenty-three thousand; normal schools for teachers, and a general system of inspection, were introduced; and boards of education, under mixed lay and clerical authority, were created. The secondary class of schools and the university of France were equally the subject of his enlightened care, and a prejudicial impulse was given to philosophical study and historical research. The branch of the Institute of France known as the "Académie des Sciences Morales et Politiques," which had been suppressed by Napoleon, was revived by Guizot. Some of the old members of this learned body—Talleyrand, Siséys, Roederer and Lanakan—again took their seats there, and a host of more recent celebrities were added by election for the free discussion of the great problems of political and social science. The "Société de l'Histoire de France," founded for the publication of historical works; and a vast publication of medieval chronicles and diplomatic papers was undertaken at the expense of the state (see History; and France, History, section Sources).

The object of the cabinet of October 1832 was to organize a conservative party, and to carry on a policy of resistance to the republican faction which threatened the existence of the monarchy. It was their pride and their boast that their measures never exceeded the limits of the law, and by the exercise of legal power alone they put down an insurrection amounting to civil war in Lyons and a serious revolt in Paris. The real strength of the monarchy lay not in its nominal heads, but in the fact that this government and this alone Guizot and Thiers acted in cordial co-operation. The two great rivals in French parliamentary eloquence followed for a time the same path; but neither of them could submit to the supremacy of the other, and circumstances threw Thiers almost continuously on a course of opposition, whilst Guizot bore the graver responsibilities of power.

Once again indeed, in 1839, they were united, but it was in opposition to M. Molé, who had formed an intermediate government, and this coalition between Guizot and the leaders of the left centre and the left, Thiers and Odilon Barrot, due to his ambition and jealousy of Molé, is justly regarded as one of the chief inconsistencies of his life. Victory was secured at the expense of principle, and Guizot's attack upon the government gave rise to a crisis and a republican insurrection. None of the three chiefs of that alliance took ministerial office, however, and Guizot was not sorry to accept the post of ambassador in London, which withdrew him for a time from parliamentary contests. This was in the spring of 1840, and Thiers succeeded shortly afterwards to the ministry of foreign affairs.

Guizot was received with marked distinction by the queen and by the society of London. His literary works were highly esteemed, his character was respected, and France was never more worthy represented abroad than by one of her greatest orators. He was known to be well versed in the history and the literature of England, and sincerely attached to the alliance of the two nations and the cause of peace. But, as he himself remarked, he was a stranger to England and a novice in diplomacy; and unhappily the embroiled state of the Syrian question, on which the French government had separated itself from the joint policy of Europe, and possibly the absence of the court confidence between the ambassador and the minister of foreign affairs, placed him in an embarrassing and even false position. The warnings he transmitted to Thiers were not believed. The warlike policy of Thiers was opposed to his own convictions. The treaty of the 15th of July was signed without his knowledge and executed in the teeth of his remonstrances. For some weeks Europe seemed to be on the brink of war, until the king put an end to the crisis by refusing his assent to the military preparations of Thiers, and by summoning Guizot from London to form a ministry and to aid his Majesty in what he termed "ma lutte tenace contre l'anarchie." Thus began, under dark and adverse circumstances, on the 20th of October 1840, the important administration in which Guizot remained the master-spirit for nearly eight years. He himself took the office of minister for foreign affairs, to which he added some years later, on the retirement of Marshal Soult, the ostensible rank of prime minister. His first care was the maintenance of peace and the restoration of amicable relations with the other powers of Europe. If he succeeded, as he did succeed, in calming the troubled waters of the Mediterranean, it was due mainly to the indomitable courage and splendid eloquence with which he faced a raging opposition, gave unity and strength to the conservative party, who now felt that they had a great leader at their head, and appealed to the thrift and prudence of the nation rather than to their vanity and their ambition. In his pacific task he was fortunately seconded by the formation of Sir Robert Peel's administration in England, in the autumn of 1841.

Between Lord Palmerston and Guizot there existed an incompatibility of character exceedingly dangerous in the foreign ministers of two great and in some respects rival countries. With Lord Palmerston in office, Guizot felt that he had a bitter and active antagonist in every British agent throughout the world; the combative element was strong in his own disposition; and the result was a system of perpetual conflict and counter-intrigues. Lord Palmerston held (as it appears from his own letters) that war between England and France was, sooner or later, inevitable. Guizot held that such a war would be the greatest of all calamities, and certainly never contemplated it. In Lord Aberdeen, the foreign secretary of the Whig ministry, the result was a personal one; and Guizot, whose policy was mean and pitiful; but it was a policy which secured peace to the world, and united the two great and free nations of the West in what was termed the entente cordiale. Neither of them would have stopped to snatch an advantage at the expense of the other; they held the common interest of peace and friendship to be paramount; and when differences arose, as they did arise, in remote parts of the world,—in Tahiti, in Morocco, on the Gold Coast,—they were reduced by this principle to their proper insignificance. The opposition in France denounced Guizot's foreign policy as basely subservient to England. He replied in terms of unmeasured contempt,—"You may raise the pile of calumny as high as you will; vous n'arriverez jamais à la hauteur de mon dédain!" The opposition in England attacked Lord Aberdeen with the same reproaches, but in vain. King Louis Philippe visited Windsor. The queen of England (in 1843) stayed at the Château d'Eu. In 1845 British and
French troops fought side by side for the first time in an expedition to the River Plate.

The fall of Sir Robert Peel’s government in 1846 changed these intimate relations; and the return of Lord Palmerston to the foreign office led Guizot to believe that he was again exposed to the passionate rivalry of the British cabinet. A friendly understanding had been established at Eu between the two courts with reference to the future marriage of the young ladies of Spain and Savoy. But Lord Palmerston and the conduct of Sir Henry Bulwer (afterwards Lord Dalling) at Madrid led Guizot to believe that this understanding was broken, and that it was intended to place a Coburg on the throne of Spain. Determined to resist any such intrigue, Guizot and the king plunged headlong into a counter-intrigue, wholly inconsistent with their previous engagements to England, and fatal to the happiness of the queen of Spain. By their influence she was urged into a marriage with a despicable offset of the house of Bourbon, and her sister was at the same time married to the youngest son of the French king, in direct violation of Louis Philippe’s promises. This transaction, although it was hailed at the time as a triumph of the policy of France, was in truth as fatal to the monarch as it was discreditable to the minister. It was accomplished by a mixture of secrecy and violence. It was defended by subterfuges. By the dispassionate judgment of history it has been universally condemned. Its immediate effect was to destroy the Anglo-French alliance, and to throw Guizot into closer relations with the reactionary policy of Metternich and the Northern courts.

The history of Guizot’s administration, the longest and the last which existed under the constitutional monarchy of France, bears the stamp of the great qualities and the great defects of his political character, for he was throughout the master-spirit of that government. His first object was to unite and discipline the conservative party, which had been broken up by previous dissensions and ministerial changes. In this he entirely succeeded by his courage and eloquence as a parliamentary leader, and by the use of all those means of influence which France too liberally supplies to a dominant minister. No one ever doubted the purity and disinterestedness of Guizot’s own conduct. He despised money; he lived and died poor; and though he encouraged the fever of money-getting in the French nation, his own habits retained their primitive simplicity. But he did not disdain to use in others the baser passions from which he was himself free. Some of his instruments were mean; he employed them to deal with meanness after its kind. Gross abuses and breaches of trust came to light even in the ranks of the government, and under an incorruptible minister the administration was pronounced as corrupt. Licit ut alieno sitio is a proposition as false in politics as it is in divinity.

Of his parliamentary eloquence it is impossible to speak too highly. It was terse, austere, demonstrative and commanding,—not persuasive, not humorous, seldom adorned, but condensed with the force of a supreme authority in the fewest words. He was essentially a ministerial speaker, far more powerful in defence than in opposition. Like Pitt he was the type of authority and resistance, unmoved by the brilliant charges, the wit, the gaiety, the irony and the discursive power of his great rival. Nor was he less a master of parliamentary tactics and of those sudden changes and movements in debate which, as in a battle, sometimes change the fortune of the day. His confidence in himself, and in the majority of the chamber which he had moulded to his will, was unbounded; and long success and the habit of authority led him to forget that in a country like France there was a people outside the chamber elected by a small constituency, to which the minister and the king himself were held responsible.

A government founded on the principle of resistance and repre- sentation and based upon dread and distrust of popular power, a system of diplomacy which sought to revive the traditions of the old French monarchy, a sovereign who largely exceeded the bounds of constitutional power and whose obstinacy augmented with years, a minister who, though far removed from the servility of the courtier, was too obsequious to the personal influence of the king, were all singularly at variance with the promises of the Revolution of July, and they narrowed the policy of the administration. Guizot’s view of politics was essentially historical and philosophical. His tastes and his acquirements gave him little insight into the practical business of administrative government. Of finance he knew nothing; trade and commerce were strange to him; military and army affairs were unfamiliar to him; all these subjects he dealt with by second hand through his friends, P. S. Dumon (1797–1870), Charles Marie Tanneguy, Comte Duchâtel (1803–1867), or Marshal Bugeaud. The consequence was that few measures of practical improvement were carried by his administration. Still less did the government lend an ear to the cry for parliamentary reform. On this subject the king’s prejudices were insurmountable, and his ministers had the weakness to give way to them. It was impossible to defend a system which confined the suffrage to 200,000 citizens, and returned a chamber of whom half were placemen. Nothing would have been easier than to strengthen the conservative party by attaching the suffrage to the possession of land in France, but blank resistance was the sole answer of the government to the just and moderate demands of the opposition.

Warning after warning was addressed to them in vain by friends and by foes alike; and they remained profoundly unconscious of their danger till the moment when it overwhelmed them. Strange to say, Guizot never acknowledged either at the time or to his dying day the nature of this error; and he speaks of himself in his memoirs as the much-enduring champion of the principle of personal government and constitutional law. He utterly fails to perceive that a more enlarged view of the liberal destinies of France and a less intense confidence in his own specific theory might have preserved the constitutional monarchy and averted a vast series of calamities, which were in the end fatal to every principle he most cherished. But with the stubborn conviction of absolute truth he dauntlessly adhered to his own doctrines to the end.

The last scene of his political life was singularly characteristic of his inflexible adherence to a lost cause. In the afternoon of the 23rd of February 1848 the king summoned his minister from the chamber, which was then sitting, and informed him that the aspect of Paris and the country during the banquet agitation for reform, and the alarm and division of opinion in the royal family, led him to doubt whether he could retain his ministry. That doubt, replied Guizot, is decisive of the question, and instantly resigned, returning to the chamber only to announce that the administration was at an end and that Molé had been sent for by the king. Molé failed in the attempt to form a government, and between midnight and one in the morning Guizot, who had according to his custom retired early to rest, was again sent for to the Tuileries. The king asked his advice. “We are no longer the ministers of your Majesty,” replied Guizot; “it rests with others to decide on the course to be pursued. But one thing appears to be evident: this street riot must be put down; these barricades must be taken; and for this purpose my opinion is that Marshal Bugeaud should be invested with full power, and ordered to take the necessary military measures, and as your Majesty has at this moment no minister, I am ready to draw up and counter-sign such an order.” The marshal, who was present, undertook the task, saying, “I have never been beaten yet, and I shall not begin to-morrow. The barricades shall be carried before dawn.” After this display of energy the king hesitated, and soon added: “I ought to tell you that M. Thiers and his friends are in the next room forming a government!” Upon this Guizot rejoined, “Then it rests with them to do what they think fit,” and left the palace. Thiers and Barrot decided to withdraw the troops. The king and Guizot next met at Clarcmont. This was the most perilous conjuncture of Guizot’s life, but fortunately he found a safe refuge in Paris for some days in the lodging of a humble miniature painter whom he had befriended, and shortly afterwards effected his escape across the Belgian frontier and thence to London, where he arrived on the 3rd of March. His mother and daughters
had preceded him, and he was speedily installed in a modest habitation in Pelham Crescent, Brompton.

The society of England, though many persons disapproved of much of his recent policy, received the fallen statesman with as much distinction and respect as they had shown eight years before to the king's ambassador. Sums of money were placed at his disposal, which he declined. A professorship at Oxford was spoken of, which he was unable to accept. He stayed in England about a year, devoting himself again to history. He published two more volumes on the English revolution, and in 1854 his Histoire de la république d'Angleterre et de Cromwell (2 vols., 1854) then his Histoire du protectorat de Cromwell et du rétablissement des Stuarts (2 vols., 1856). He also published an essay on Peel, and amid many essays on religion, during the ten years 1858-1868, appeared the extensive Mémoires pour servir à l'histoire de mon temps, in nine volumes. His speeches were included in 1863 in his Histoire posthume de la France (5 vols. of parliamentary speeches, 1863).

Guizot survived the fall of the monarchy and the government he had served twenty-six years. He passed abruptly from the condition of one of the most powerful and active statesmen in Europe to the condition of a philosophical and patriotic spectator of human affairs. He was aware that the link between himself and public life was broken for ever; and he never made the slightest attempt to renew it. He was of no party, a member of no political body; no murmurs of disappointed ambition, no language of political discontent, was heard from his lips; it seemed as if the fever of oratorical debate and ministerial power had passed from him and left him a greater man than he had been before, in the pursuit of letters, in the conversation of his friends, and as head of the patriarchal circle of those he loved. The greater part of the year he spent at his residence at Val Richer, an Augustinian monastery near Lisieux in Normandy, which had been sold at the time of the first Revolution. His two daughters, who married two descendants of the illustrious Dutch family of De Witt, so congenial in faith and manners to the Huguenots of France, kept his house. One of his sons-in-law farms the estate. And here Guizot devoted his later years with undiminished energy to literary labour, which was in fact his chief means of subsistence. Proud, independent, simple and contented he remained to the last; and these years of retirement were perhaps the happiest and most serene portion of his life.

Two institutions may be said even under the second empire to have retained their freedom—the Institute of France and the Protestant Consistory. In both of these Guizot continued to the last to take an active part. He was a member of three of the five academies of which the Institute of France is divided and of the Academy of Moral and Political Science owed its restoration to him, and he became in 1832 one of its first associates. The Academy of Inscriptions and Belles Lettres elected him in 1833 as the successor to M. Dacier; and in 1836 he was chosen a member of the French Academy, the highest literary distinction of the country. In these learned bodies Guizot continued for nearly forty years to take a lively interest and to exercise a powerful influence. He was the jealous champion of their independence. His voice had the greatest weight in the choice of the members, and his influence on the young men of the younger generation of French writers never looked in vain to him for encouragement; and his constant aim was to maintain the dignity and purity of the profession of letters.

In the consistory of the Protestant church in Paris Guizot exercised a similar influence. His early education and his experience of life conspired to strengthen the convictions of a religious temperament. He remained through life a firm believer in the truths of revelation, and a volume of Meditations on the Christian Religion was one of his latest works. But though he adhered inflexibly to the church of his fathers and combated the rationalist tendencies of the age, which seemed to threaten with destruction, he retained not a tinge of the intolerance or asperity of the Calvinistic creed. He respected in the Church of Rome the faith of the majority of his countrymen; and the writings of the great Catholic prelates, Bossuet and Bourdaloue, were as familiar and as dear to him as those of his own persuasion, and were commonly used by him in the daily exercises of family worship.

In these literary pursuits and in the retirement of Val Richer years passed smoothly and rapidly away; and as his grandchildren grew up around him, he began to direct their attention to the history of their country. From these lessons springing last and not his least work, the Histoire de France racontée à mes petits enfants, for although this publication assumed a popular form, it is not less complete and profound than it is simple and attractive. The history came down to 1789, and was continued to 1870 by his daughter Madame Guizot de Witt from her father's notes.

Down to the summer of 1874 Guizot's mental vigour and activity were unimpaired. His frame, temperate in all things, was blessed with a singular immunity from infirmity and disease; but the vital power ebbed away, and he passed gently away on the 12th of September 1874, reciting now and then a verse of Corneille or a text of Scripture.

GUJARAT or GUJERAT, a region of India, in the Bombay Presidency. In the widest sense of the name it includes the whole of the country where the Gujarati language is spoken, i.e. the northern districts and states of the Presidency from Palanpur to Damaun, with Kathiawar and Cutch. But it is more properly confined to the country north of the Nerbudda and east of the Rann of Cutch and Kathiawar. In this sense it has an area of 29,071 sq. m., with a population in 1901 of 4,798,504. It includes the states distributed among the agencies of Palanpur, Mahi Kantha, Rewa Kantha and Cambay, with most of Baroda and the British districts of Ahmedabad, Kaira, Panch Mahals and Broach. Less than one-fourth is British territory. The region takes its name from the Gujars, a tribe who passed into India from the north-west, established a kingdom in Rajputana, and spread south in A.D. 400-600. The ancient Hindu capital was Anhilwada, the Mahomedan dynasty, founded from 1312 to 1572, founded Ahmedabad, which is still the largest city; but Gujrat owed much of its historical importance to the seaports of Broach, Cambay and Surat. Its fertile plain, with a regular rainfall and numerous rivers, has caused it to be styled the "garden of India." It suffered, however, severely from the famine of 1899-1901. For an account of the history, geography, &c., of Gujarat see the articles on the various states and districts. Gujrat gives its name to the vernacular of northern Bombay, viz. Gujarati, one of the three great languages of the presidency, by more than 4 millions. It has an ancient literature and a peculiar character. As the language of the Parsis it is prominent in the Bombay press; and it is also the commercial language of Bombay city, which lies outside the territorial area of Gujrat. See J. Campbell, History of Gujarat (Bombay, 1886); Sir E. C. Bayley, The Muhammadan Kingdom of Gujarat (1886); A. K. Forbes, Ras Mula (1886).

GUJARATI and RAJASTHANI, the names of two members of the western sub-group of the Intermediate Group of Indo-Aryan languages (q.v.). The remaining member of this sub-group is Panjabi or Punjabi (see HINDOSTANI). In 1901 the speakers of those now dealt with numbered: Gujarati, 9,439,925, and Rajasthani, 10,917,712. The two languages are closely connected and might almost be termed co-dialects of the same form of speech. Together they occupy an almost square block of country,
some 400 m. broad, reaching from near Agra and Delhi on the river Jumna to the Arabian Sea. Gujarati (properly Gujarāṭī) is spoken in Gujarāt, the northern maritime province of the Bombay Presidency, and also in Baroda and the native states adjoining. Rajasthani (properly Rājāstānī, from " Rājāsthān," the native name for Rajputana) is spoken in Rajputana and the adjoining parts of Central India.

In the articles Indo-Aryan Languages and Prakrit the history of the earlier stages of the Indo-Aryan vernaculars is given some length. It is there shown that, from the most ancient times, there were two main groups of these forms of speech—one, the language of the Middle, spoken in the country near the Ganges Doab, and the other, the so-called "Outer Band," containing the Middle on three sides, west, north, and south. The country to the west and south-west of the Middle, in which this outer group of languages was spoken, included the modern Punjab, Rajputana and Gujarāt. In process of time the population of the Middle expanded and carried its language to its new homes. It occupied the eastern and central Punjab, and the mixed (or "intermediate") language which there grew up became the modern Panjābi. To the west it spread into Rajputana, till its progress was stopped by the Indian desert, and in Rajputana another intermediate language took rise and became Rajasthani. As elsewhere explained, the language-wave of the Middle exercised less and less influence as it travelled farther from its home, so that, while in eastern Rajputana the local dialect is now almost a pure midland speech, in the west there are many evident traces of the old outer language, especially to the South of Rajputana there was no desert to stop the wave of midland expansion, which therefore rolled on unobstructed into Gujarāt, where it reached the sea. Here the survivals of the old outer language are stronger still. The old outer Prakrit of north Gujarāt was known as "Saurāṣṭrī," while the Prakrit of the midland invaders was called "Sauraṇāthī," and we may therefore describe Gujarāt as being an intermediate language derived (as explained in the articles Prakrit) from a mixture of the Apabhraṃśa forms of Saurāṣṭrī and Sauraṇāthī, in which the latter predominated.

It will be observed that, at the present day, Gujarāt breaks the continuity of the outer band of Indo-Aryan languages. To its north it has Sindhi and to its south Marathi, both outer languages with which it has only a slight connexion. On the other hand, on the east and north-east it has Rajasthani, into which it merges so gradually and imperceptibly that at the conventional border-line, in the state of Palanpur, the inhabitants of Rajputana say that the local dialect is a form of Gujarāt, while the inhabitants of Gujarāt say that it is Rajasthani.

Gujarāt has no important local dialects, but there is considerable variation in the speech of the different classes of the community. Parsees and Mussulmans (when the latter use the language—as a rule the Gujarāt Mussulmans speak Hindostani) have some striking peculiarities of pronunciation, the most noticeable of which is the disregard by the latter of the distinction between cerebral and dental letters. The uneducated Hindus do not pronounce the language in the same way as their betters, and this difference is accentuated in northern Gujarāt, where the lower classes substitute s for £, k for ch, ch for kk, s for c and ch, h for s, and drop h as readily as any cockney. There is also (as in the case of the Mussulmans) a tendency to confuse cerebral and dental consonants, and to substitute r, r, and l, to double medial consonants, and to pronounce the letter a as å, something like the a in "all." The Bhils of the hills east of Gujarāt also speak a rude Gujarāt, with special dialectic peculiarities of their own, probably due to the fact that the tribes are of Dravidian origin. These Bhil peculiarities are further fixed with corruptions of Marathi idioms in Nimar and Khândesh, where we have almost a new language.

Rajasthani has numerous dialects, each state claiming one or more of its own. Thus, in the state of Jaipur there have been catalogued no less than ten dialects amounting about 1,688,000 people. All Rajasthani dialects can, however, be easily classified into four well-defined groups, a north-easterly, a southern, a western and an east-central. The north-easterly (Mēwārī) is that form of Rajasthani which is merging into the Western Hindi of the Midland. It is a mixed form of speech, and need not detain us further. Similarly, the southern (Mālvi) is much mixed with the neighbouring Bundeli form of Western Hindi. The western (Māravārī) spoken in Marwar and its neighbourhood, and the east-central (Jaipuri) spoken in Jaipur and its neighbourhood, may be taken as the typical Rajasthani dialects. In the following paragraphs we shall therefore confine ourselves to Gujarāt, Marwar and Jaipur.

We know more about the ancient history of Gujarāt than we do about that of any other Indo-Aryan language. The one native grammar of Apabhraṃśa Prakrit which we possess in a printed edition, was written by Ḫemacandra (12th century A.D.), who lived in what is now north Gujarāt, and who naturally described most fully the particular vernacular with which he was personally familiar. It was known as the Nāgara Apabhraṃśa, closely connected (as above explained) with Sauraṇas, and was therefore named the Nāgara Brahman of the locality. These men carried on the tradition of learning inherited from Ḫemacandra, and we see Gujarāt, in the act of taking birth in a work called the Mukhāsāvādhaṃauktika, written by one of them only two hundred years after his death. Formal Gujarāt literature is said to commence with the poet Narsingh Mēṭa in the 15th century. Rajasthani literature has received but small attention from European or native scholars, and we are as yet unable to say how far back the language goes.

Both Gujarāt and Rajasthani are usually written in current script and to the well-known Nāgara alphabet (see Sanskrit). The form employed in Rajasthani is the same as that used in north India as the "Mahājānī" alphabet, being used by bankers or Mahājāns, most of whom are Marwaris. It is noteworthy as possessing two distinct characters for ð and r. The Gujarāt character closely resembles the Kaithī character of northern India (see Bihari). The Nāgara character is also freely used in Rajputana, and to a less extent in Gujarāt, where it is employed by the Nāgara Brahman, who claim that their tribe has given the alphabet its name.

In the following description of the main features of our two languages, the reader is presumed to be familiar with the leading facts stated in the articles Indo-Aryan Languages and Prakrit. The article Hindostani may also be perused with advantage.

The Gujarāt language is very free from tātsama words. The great mass of both vocabularies is tadbhava (see Indo-Aryan Languages). Rajputana was from an early period exposed both to the influence of the Mogul court at Agra and Delhi, and even in the 15th century a b. o. official documents of the Rajput princes contained many borrowed Persian and Arabic words. Gujarāt, under the influence of the learned Nāgara Brahman, has perhaps more tātsama words than Rajasthani, but their employment is not excessive. On the other hand, Parsees and Mussulmans employ Persian and Arabic words with great freedom; while, owing to its maritime connexions, the language has also borrowed occasional words from other parts of Asia and from Europe.

This is specially marked in the strange dialect of the Kathiawar boatmen who travel all over the world as lascars on the great steamships. The language is the native feature of Hindostani and Gujarāt with a heterogeneous vocabulary.

Phonetics.—With a few exceptions to be mentioned below, the sound-system of the two languages is the same as that of Sanskrit, and the vowels of the Apabhraṃśa are retained in the same manner in the Roman character (see Sanskrit). The simplest method for considering the subject in regard to Gujarāt is to compare it with the phonetic system of Hindustani. In the case of Rajasthani characters and sounds need not be referred to except in special cases. G. invariably simplifies a mediāl Pr. double consonant, lengthening the preceding vowel in compensation. The Bhils of the hills east of Gujarāt also speak a rude Gujarāt, with special dialectic peculiarities of their own, and need not be referred to except in special cases. G. generally simplifies a mediāl Pr. double consonant, lengthening the preceding vowel in compensation. Thus Skr. mṛkṣṣṣṇam, Ap. mākṣṣṇa, and G. mākṣēn, but G. mākṣē in the next word. The distinction between ¥ and ¥ is observed, but in G. it is universal, while, on the other hand, in Panjābi the double consonant is never simplified, but is retained as in Pr. In G. (and sometimes in R.) when s is followed by a vowel, the gutturals are simplified, thus G. bẖ and bẖ, instead of bẖ and bẖ. In the other outer languages H. ai and au are usually represented by a short e and by a (sounded like the a in "all") respectively. Thus H. bẖai, G. bẖai, instead of bẖai; and G. cẖai (written cẖai), fourth. It is curious that this e is often further weakened to the sound of a in "man," a change
which is also common in Bengali. Many words which have "i" in H. have a "u" in G. and, thus, H. likhī, G. likhō, he writes; H. din, G. and R. dan, a day. Similarly we have a "u" for "a", as in H. tum, G. R. támē, you. In colloquial G. "a" often becomes "i", and "i" becomes "e"; thus, ēma, a father. As in most Indo-Aryan vernaculars an "a" after an accented syllable is very lightly pronounced, and is here represented by a small "a" above the line.

The general oblique case can be employed for any case except the nominative, but, in order to define the meaning, it is customary to add postpositions as in Hindustani. These are:

<table>
<thead>
<tr>
<th>Genitive</th>
<th>Dative</th>
<th>Ablative</th>
<th>Locative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gujarati</td>
<td>ṅo</td>
<td>ṅe</td>
<td>ṃe</td>
</tr>
<tr>
<td>Rajasthani</td>
<td>ṛo, ḫo</td>
<td>ṅai, ṛai</td>
<td>ṃi</td>
</tr>
</tbody>
</table>

The suffix "o" of the genitive is believed to be a contraction of "apā", which is found in old Gujarati poetry, and which, under the form "ānās" in Sanskrit and "ānāpā" in Apabhraṃśa, means "belonging to." It is an adjective, and agrees in gender, number and case with the thing possessed. Thus, ṛājā-ṇā dikrö, the king's seat; ṛājā-ṇā diṅtī, the king's daughter; ṛājā-ṇā dikā, the king's house; ṛājā-ṇā dikā, the king's room. In all Indian languages the formal oblique case masculine is marked by the addition of "tī" (for "ātī"), while the feminine uses "ārā" instead. The nominative is the same as the ablative, and the genitive is used in the same cases as the dative.

For the genitive plural, suffixes are used. One such form, "ānās" in the Sanskrit, is used in Indo-Aryan languages. For the oblique case, suffixes are used in the same language. The suffix "ānās" is used in the genitive plural, and the suffix "ānās" is used in the oblique case. The genitive plural is used in the same language as the ablative, and the genitive is used in the same cases as the dative.

The suffix "ānās" is used in the genitive plural, and the suffix "ānās" is used in the oblique case. The genitive plural is used in the same language as the ablative, and the genitive is used in the same cases as the dative.
The derivation of the G. t plural is unknown. That of the other G. and R. forms is manifest. The imperfect closely follows this, but as usual has no termination in the second person singular.

In R. the future may be formed by adding do (cf. Hindustani do), do, or dā to the old present. Thus, cā, cā, cā or cāhā I shall go. In the plural, do is used in gender, but the pronunciation is the same. The termination with dā has also been noted in Bhopuri (see Bihar), in Marathi and in Nepali. For G do see Hindustani. Another form of the future has s or h for its characteristic letter, and is the only one employed in G. Thus, Ap. cā or cāhā, G. cākhāt, R. (Jaipur) cāhā, (Marwari) cāhā. The personal terminations differ considerably from those of the old present, and close akin to the English. Thus, Ap. 3 sing. cākhā or cākhā, G. cākhā, Marwari cāhā.

The participles and infinitives are as follows:

<table>

In G. the infinitive is simply the neuter of the future passive participle. The participles are employed to form finite tenses; thus G. cākhā, I used to go; cākhā, I went. If the verb is transitive (see Hindustani) the passive form of the past participle comes into force. The subject is put into the case of the agent, and the participle inflects to agree with the object, or, if there is no object, is employed impersonally in the neuter (in G.) or in the masculine (in R.). In Hindustani, if the object is expressed in the dative, the participle is also employed impersonally, in the masculine; thus rājā-nē thern-hō nūrā [masc., not nūrā, fem.], by-the-king, with reference-to-the-tigress, it (impersonal) was killed; i.e. the king killed the tigress. But in G. and R. even if the object is in the dative, the past participle agrees with it; thus, G. rājā vāg-yān-nē nūrā, by-the-king, with reference-to-the-tigress, she was killed. Other examples of G. from this passive construction are mē kakhya, by me it was said; cā, cā, cāhā, in the wilderness, days were passed, i.e. she passed her days in the wilderness; rājā śivāry, the king considered. The idiom of R. is exactly the same in these cases, except that the masculine must be used, where G. has the neuter; thus, rājā śivāry. The future passive participle is construed in much the same way, but (as in Latin) the subject must be passive. Thus, cā, cā, cāhā, by someone, to his business is to be done.

Prakrit pleonastic suffix -illa-, which was not used by the Prakrit of the Midland, but was common elsewhere. Compare, for instance, the Prakrits cāndhā, cāndhā, which is one of the many survivals of the old Aryan language; this -dha- participle is typical of most of the languages of the outer band, including Marathi, Oriya, Bengali, Bihari and Assamese. It is formed by the addition of the

The usual verbs substantive are as follows: G. chā, R. hā or chā, I am, which are conjugated regularly as old presents, and G. hāto, R. chāto, which is a perfect past, is the perfect past of the substantive. The use of these as auxiliaries the finite verb makes a whole series of periphrastic tenses. A perfect definite is formed by conjugating the old present tense (not the present participle) with the present tense of the substantive: thus, ca, cā, cāhā I have been. A similar idiom is found in some Western Hindi dialects, but Hindustani employs the present participle; thus, ca, cā, cāhā. In G. and R., however, the imperfect is formed with the second person singular. In G. hā cāhāt hāto, I was going. So, as in H., we have a perfect hā cilāy (or cilāī) chā, I have gone, and a pluperfect hā cilā (or cilāī) hāto, I had gone. The R. periphrastic tenses are made on the same principles. With the genitive of the G. future passive participle, cālīn-hā, there is a kind of gerundive, as in hā cilān-hā chā, I am to be gone, i.e. I am about to go; hā cilān-hāto, I was about to go. The same series of derivative verbs occurs in G. and R. as in H. Thus, we have a potential passive (a simple passive in G.) formed by adding kā to the base, as in G. lāhkhāvā, to write, lāhkhāvā, to be written; and a causal by adding dō or dā, as in lāhkhāvā, to cause to write; lāhkhāvā, to be made to write. It may also be noted that G. from the causal, as in tapāvā, to heat; tapāvā, to cause to heat; tapāvā, be heated. Several verbs have irregular passive past participles. These must be learnt from the grammar. So also the numerous compound verbs, such as (G.) cā cilāvā, to be able to go; cā cilāvā, to have completed gone; cilāy kāvā, to be in the habit of going, and so on.

Some very little is known about the literature of Rajputana, except that it is of large extent. It includes a number of hardy chronicles of which only one has been partially edited, but the contents of which have been described by Tod in his Literature of the Amired Rajasthans. It also includes a considerable religious literature, but the whole mass of this is still in MS. From those specimens which the present writer has examined, it would appear that most of the authors wrote in Braj Bhasha, the Hindi literary dialect of Hindustani (g.v.). In Marwar it is an acknowledged fact that the literature falls into two branches, one called Pingal and couched in Braj Bhasha, and the other called Dingal and couched in Rajasthani. The most admired work in Dingal is the Rajkunalā Rāpāk written by Mansā Rām in the beginning of the 19th century. It is nominally a treatise on poetry, but, like many other works of the same kind, it contrives to pay a double debt, for the examples of the metres are so arranged as to form a complete epic poem celebrating the deeds of the hero Rāma.

The earliest writer of importance in Gujarati, and its most admired poet, was Narsingh Mētā, who lived in the 15th century A.D. Before him there were writers on Sanskrit grammar, rhetoric and the like, who employed an old form of Gujarati for their explanations. Narsingh does not appear to have written any considerable work, his reputation depending on his short songs, many of which exhibit much fidelity of diction. He had several successors, all admittedly his inferiors. Perhaps the most noteworthy of these was Rewārān, the translator of the Mākāhrāt (see Sanskrit: Literature). A more important side of Gujarati literature is its hardy chronicles, the contents of which have been utilized by Forbes in his Rās Mālā. Modern Gujarati literature mostly consists of translations or imitations of English works.

AUTHORITIES.—Volume I. of the Linguistic Survey of India contains a complete list and index of Gujarati and Rajasthani, including their various dialectic forms. For Rajasthani, see S. H. Kellogg, Grammar of the Hindi Language (2nd ed., London, 1883); P. C. Dogra, The Student's Gujarati Grammar (2nd ed., Bombay, 1908). As for dictionaries, the most authoritative is the Narma-kāt of Narma

GUJRANWALA — GULBARGA

Sankan (Bhaunagar and Surat, 1873), in Gujrat, throughout. For English readers we may mention Shahpurji Edalji’s (2nd ed., Bombay, 1878), the introduction to which contains an account of Gujrat at Hyderabad, Belkare’s (Ahmedabad, 1895), and Karharbi’s (Ahmedabad, 1899).

GUJRANWALA, a town and district of British India, in the Lahore division of the Punjab. The town is situated 40 m. N. of Lahore by rail. It is of modern growth, and owes its importance to the father and grandfather of Maharaja Ranjit Singh, whose capital it formed during the early period of the Sikh power. Pop. (1901) 20,224. There are manufactures of brass-ware, jewellery, and silk and cotton scarves.

The District comprises an area of 3108 sq. m. In 1901 the population was 756,797, showing an increase of 29% in the decade. The district is divided between a low alluvial tract along the rivers Chenab and Dehghan and the upland between them, which forms the central portion of the Rechna Doab, intermediate between the fertile submontane plains of Sialkot and the desert expanses of Jhang. Part of the upland tract has been brought under cultivation by the Chenab canal. The country is very bare of trees, and the scenery throughout is tame and monotonous. Lahore becomes the centre of most of the action in the district, once contained the capital of the Punjab, at an epoch when Lahore had not begun to exist. We learn from the Chinese Buddhist pilgrim, Hsuan Tsang, that about the year 650 he visited a town known as Tse-kia (or Taki), the metropolis of the whole country of the five rivers. A mound near the modern village of Assarur has been identified as the site of the ancient capital. Until the Mahomedan invasions little is known of Gujranwala, except that Taki had fallen into oblivion and Lahore had become the chief city. Under Mahomedan rule the district flourished for a time; but a mysterious depopulation fell upon the tract, and the whole region seems to have been almost entirely abandoned. On the rise of Sikh power, the waste plains of Gujranwala were seized by various military adventurers. Charat Singh took possession of the village of Gujranwala, and here his grandson the great Maharaja Ranjit Singh was born. The Sikh rule, which was elsewhere so disastrous, appears to have been an unmitigated benefit to this district. Ranjit Singh settled large colonies in the various villages, and encouraged cultivation throughout the depopulated plain. In 1847 the district came under British influence in connexion with the reorganization of the Punjab in 1849, and in 1850 it was included in the territory annexed after the second Sikh war. A large export trade is carried on in cotton, wheat and other grains. The district is served by the main line and branches of the North-Western Railway.

GUJRAT, a town and district of British India, in the Rawalpindi division of the Punjab, lying on the south-western border of Kashmir. The town stands about 5 m. from the right bank of the river Chenab, 70 m. N. of Lahore by rail. Pop. (1901) 19,410. It is built upon an ancient site, formerly occupied, according to tradition, by two successive cities, the second of which is supposed to have been destroyed in 1303, the year of a Mongol invasion. More than 200 years later either Sher Shah or Akbar founded the existing town. Though standing in the midst of a Jat neighbourhood, the fort was first garrisoned by Gujars, and took the name of Gujrat. Akbar’s fort, largely improved by Gujar Singh, stands in the centre of the town. The neighbouring shrine of the saint Shah Daula serves as a kind of native asylum for lunatics. The town has manufactures of furniture, inlaid work in gold and iron, brass-ware, boots, cotton goods and other articles.

The District of Gujrat comprises a narrow wedge of sub-Himalayan plain country, possessing few natural advantages. From the basin of the Chenab on the south the general level rises rapidly towards the interior, which, owing to the great distance of the water beneath the surface, assumes a dreary and desert aspect. A range of low hills, known as the Pabbi, traverses the northern angle of Gujrat. They are composed of a friable Tertiary sandstone and conglomerate, destitute of vegetation, and presenting a mere barren chaos of naked rock, deeply scored with precipitous ravines. Immediately below the Pabbi stretches a high plateau, terminating abruptly in a precipitous bluff some 200 ft. in height. At the foot of this plateau is a plain, which forms the actual valley of the Chenab and participates in the irrigation from the river bed.

Numerous relics of antiquity stud the surface of the district. Mounds of ancient construction yield early coins, and bricks are found whose size and type prove them to belong to the prehistoric period. A mound now occupied by the village of Moga or Mong has been identified as the site of Nicaea, the city built by Alexander the Great on the field of his victory over Porus. The town appears to have been founded by the Sikhs under Bahlo Lodi (1451-1489). A century later it was visited by Akbar, who founded Gujrat as the seat of government. During the decay of the Mogul power, the Ghakkar of Rawalpindi overran this portion of the Punjab and established themselves in Gujrat about 1741. Meanwhile the Sikh power had been asserting itself in the eastern Punjab, and in 1765 the Ghakkar chief was defeated by Sirdar Gujjar Singh, chief of the Bhangi confederacy. On his death, his son succeeded him, but after a few months’ warfare, in 1768, he submitted himself as vassal to the Sikh Ruler, Ranjit Singh. In 1846 Gujrat first came under the supervision of British officials. Two years later the district became the theatre for the important engagements which decided the event of the second Sikh war. After several bloody battles in which the British were unsuccessful, the Sikh power was irretrievably broken at the engagement which took place at Gujrat on the 22nd of February 1849. The Punjab then passed by annexation under British rule.

The district comprises an area of 2051 sq. m. In 1901 the population was 730,548, showing a decrease of 17%, compared with an increase of 10% in the previous decade. The district has a large export trade in wheat and other grains, oil, wool, cotton and hides. The main line and the Sind-Sagar branch of the North-Western Railway traverse it.

GULA, a Babylonian goddess, the consort of Ninib. She is identical with another goddess, known as Bau, though it would seem that the two were originally independent. The name Bau is more common in the oldest period and gives way in the post-Khammarabic age to Gula. Since it is probable that Ninib (Bau) has absorbed the cults of minor sun-dolts, the two names may represent consorts of different gods. However this may be, the qualities of both are alike, and the two occur as synonymous designations of Ninib’s female consort. Other names borne by this goddess are Nin-Karrak, Ga-tum-dung and Nin-din-dung, the latter signifying “the lady who restores to life.” The designation well emphasizes the chief trait of Bau-Gula which is that of healer. She is often spoken of as “the great physician,” and accordingly plays a specially prominent role in incantations and incubation rituals intended to relieve those suffering from disease. She is, however, also invoked to curse those who trample upon the rights of rulers or those who do wrong with malicious intent. As in the case of Ninib, the cult of Bau-Gula is prominent in Shurgulla and in Nippur. While generally in close association with her consort, she is also invoked by herself, and thus remains a large measure of independence than most of the goddesses of Babylonia and Assyria. She appears in a prominent position on the designs accompanying the Kudurrus boundary-stone monuments of Babylonia, being represented by a statue, when other gods and goddesses are merely pictured by their shrines, by sacred animals or by weapons. In neo-Babylonian days her cult continues to occupy a prominent position. In the reigns of Nebuchadnezzar II and Nebuchadnezzar III, speaks of no less than three churches or shrines within the sacred precincts of E-Zida in the city of Borsippa, besides a temple in her honour at Babylon.

(M. J.A.)

GULBARGA, an ancient city of India, situated in the Nizam’s dominions, 70 m. S.E. of Sholapur. Pop. (1901) 29,282. Originally a Hindu city, it was made the capital of the Bahmani kings when that dynasty established their independence in the Deccan in 1347, and it remained such until 1442. The palaces, mosques and tombs of these kings still stand half-ruined. The most notable building is a mosque modelled after that of Cordova.
in Spain, covering an area of 38,000 sq. ft., which is almost unique in India as being entirely covered in. Since the opening of a station on the Great India Peninsula railway, Gulbarga has become a centre of trade, with cotton-spinning and weaving mills. It is also the headquarters of a district and division of the same name. The district, as recently reconstituted, has an area of 6004 sq. m.; pop. (1901), 1,041,067.

**GULF STREAM**, the name properly applied to the stream current which issues from the Gulf of Mexico and flows north-eastward, following the eastern coast of North America, and separated from it by a narrow strip of cold water (the Cold Wall), to a point east of the Grand Banks off Newfoundland. The Gulf Stream is a narrow, deep current, and its velocity is estimated at about 80 m. a day. It is joined by, and often indistinguishable from, a large body of water which comes from outside the West Indies and follows the same course. The term was formerly applied to the drift current which carries the mixed waters of the Gulf Stream and the Labrador current eastwards across the Atlantic. This is now usually known as the "Gulf Stream drift," although the name is not altogether appropriate.

**GULFWEED**, in botany, a popular name for the seaweed Sargassum bacciferum, one of the brown seaweeds (Phaeophyceae), large quantities of which are found floating in the Gulf of Mexico, whence it is carried northwards by the Gulf Stream, small portions sometimes being borne as far as the coasts of the British Isles. It was observed by Columbus, and is remarkable among seaweeds for its form, which resembles branches bearing leaves and berries; the latter, to which the species-name bacciferum refers, are hollow floats answering the same purpose as the bladders in another brown seaweed, Fucus vesiculosus, which is common round the British Isles between high and low water.

**GULL, SIR WILLIAM WITHEY, 1st Bart. (1856-1890),** English physician, was the youngest son of John Gull, a barge-owner and wharfinger of Thorpe-le-Soken, Essex, and was born on the 31st of December 1856 at Chelchester. He began life as a schoolmaster, but in 1877 Benjamin Harrison, the treasurer of Guy's Hospital, who had noticed his ability, brought him up to London from the school at Lewes where he was usher, and gave him employment at the hospital, where he also gained permission to attend the lectures. In 1883 he was made a lecturer in the medical school of the hospital, in 1851 he was chosen an assistant physician, and in 1856 he became full physician. In 1847 he was elected Fullerian professor of physiology in the Royal Institution, retaining the post for the usual three years, and in 1848 he delivered the Gulstonian Lectures at the College of Physicians, where he filled every office of honour but that of president. He died in London on the 29th of January 1890 after a series of paralytic strokes, the first of which had occurred nearly three years previously. He was created a baronet in 1892, in recognition of the skill and care he had shown in attending the prince of Wales during his attack of typhoid in 1871. Sir William Gull's fame rested mainly on his success as a clinical practitioner; as he said himself, he was "a clinical physician or nothing." This success must be largely ascribed to his remarkable powers of observation, and to the great opportunities he enjoyed for gaining experience of disease. He was sometimes accused of being a disbeliever in drugs. That was not the case, for he prescribed drugs like other physicians when he considered them likely to be beneficial. He felt, however, that their administration was only a part of the physician's duties, and his mental honesty and outspokenness prevented him from deluding either himself or his patients with unwarranted notions of what they can do. But though he regarded medicine as primarily an art for the relief of physical suffering, he was far from disregarding the scientific side of his profession, and he made some real contributions to medical science. His papers were printed chiefly in Guy's Hospital Reports and in the proceedings of learned societies; among the subjects he wrote about were cholera, rheumatic fever, typhoid, paraplegia and abscess of the brain, while he distinguished for the first time (1873) the disease now known as myxoedema, describing it as a "cretinoid state in adults."

**GULL** (Welsh gwylau, Breton, godann, whence Fr. goëland), the name commonly adopted, to the almost entire exclusion of the O. Eng. Mew (Icel. modalità, Dan. duusge, Swedish Greve, Norse Gleva, Dutch meuw, Fr. mouette), for a group of sea-birds widely and commonly known, all belonging to the genus Larus of Linnaeus, which subsequent systematists have broken up in a very arbitrary and often absurd fashion. The family Laridae is composed of two chief groups, Larinae and Sternae --the gulls and the terns, though two other subfamilies are frequently counted, the skuas (Stercorarinae), and that formed by the single genus Rhynchops, the skimmers; but there seems no strong reason why the former should not be referred to the Larinae and the latter to the Sternae. The gulls are the gulls of the English people, as South Saunders, who has subjected the group to a rigorous revision (Proc. Zool. Society, 1878, pp. 155-211), admits forty-nine species of them, which places in five genera instead of the many which some prior investigators had sought to establish. Of the genera recognized by him, Pagophila and Rhodostethia have but one species each, Rissa and Xema two, while the rest belong to Larus. The Pagophila is the so-called ivory-gull, P. eburneae, names which hardly do justice to the extreme whiteness of its plumage, to which its jet-black legs offer a strong contrast. The young, however, are spotted with black. An inhabitant of the most northern seas, examples, most commonly young birds of the year, find their way in winter to more temperate shores. Its breeding-place has seldom been discovered, and the first of its eggs ever seen by ornithologists was brought home by Sir L. M'Cliston in 1853 from Cape Krabbe (Journ. R. Dubl. Society, i. 60, pl. 1); others were subsequently obtained by Dr Malmorg in Spitsbergen. Of the species of Rissa, one is the abundant and well-known kittiwake, R. iridactyla, of circumpolar range, breeding, however, also in comparatively low latitudes, as on the coasts of Britain, and in winter frequenting southern waters. The other is R. brevirostris, limited to the North Pacific, between Alaska and Kamchatka. The singular fact requires to be noticed that in both these species the hind toe is generally deficient, but that examples of each are occasionally found in which this functionless member has not wholly disappeared. We have then the genus Larus, which ornithologists have attempted most unsuccessfully to subdivide. It contains the largest as well as the smallest of gulls. In some species the adults assume a dark-coloured head every breeding-season, in others any trace of dark colour is the mark of immaturity. The larger species prey fiercely on other kinds of birds, while the smaller content themselves with a diet of small animals, often insects and worms. But however diverse be the appearance, structure or habits of the extremities of the series of species, they are so closely connected by intermediate forms that it is hard to find a gap between them that would justify a generic division. Forty-three species of this genus are recognized by Saunders. About fifteen belong to Europe and fourteen to North America, of which (excluding stragglers) some fifteen might be common to both countries. Our knowledge of the geographical distribution of several of them is still incomplete. Some have a very wide range, others very much the reverse, as witness L. fuliginosus, believed to be confined to the Galapagos, and L. scopulinus and L. bulleri to New Zealand,—the last indeed perhaps only to the South Island. The largest species of the group are the glaucous gull and greater black-backed gull, L. glaucus and L. marinus, of which the former is circumpolar, and the latter nearly so—not being hitherto found between Labrador and Japan. The smallest species is the European L. minutus, though the North American L. philadelphia does not much exceed it in size. Many of the gulls congregate in vast numbers to breed, whether on rocky cliffs of the sea-coast.
or on healthy islands in inland waters. Some of the settlements of the black-headed or "peewit" gull, L. ridibundus, are a source of no small profit to their proprietors,—the eggs, which are rightly accounted a great delicacy, being taken on an orderly system up to a certain day, and the birds carefully protected. Ross's or the roseate gull, Rhodostethia rosea, forms a well-marked genus, distinguished not so much by the pink tint of its plumage (for that is found in other species) but by its small dove-like bill and wedge-shaped tail. It is an exceedingly scarce bird, and beyond having an Arctic habitat, little has yet been ascertained about it. More rare still is one of the species of Xema, X. furcatum, of which only two specimens, both believed to have come from the Galapagos, have been seen. Its smaller congener Sabine's gull, X. sabini, is more common, and has been found breeding both in Arctic America and in Siberia, and several examples, chiefly immature birds, have been obtained in the British islands. Both species of Xema are readily distinguished from all other gulls by their forked tails.

GULLY, JOHN (1783–1863), English sportsman and politician, was born at Wick, near Bath, on the 21st of August 1783, the son of an innkeeper. He came into prominence as a bowler in 1805 he was matched against Henry Pearce, the "Game Chicken," before the duke of Clarence (afterwards William IV.) and numerous other spectators, and after fighting sixty-four rounds, which occupied an hour and seventeen minutes, was beaten. In 1807 he twice fought Bob Gregson, the Lancashire giant, for two hundred guineas a side, winning on both occasions. As the landlord of the "Plough" tavern in Carey Street, London, he retired from the ring in 1808, and took to horse-racing. In 1827 he lost £40,000 by backing his horse "Bamborough," for which he had paid four thousand guineas) for the St Leger. In partnership with Robert Ridskale, in 1832, he made £15,000 by winning the Derby and St Leger with "St Giles" and "Margrave." In partnership with John Day he won the Two Thousand Guineas with "Ugly Buck" in 1834, and two years later he took the Derby and the Oaks with "Pyrrhus the First" and "Mendicant," in 1834 the Two Thousand Guineas with "Hermite," and in the same year, in partnership with Henry Padwick, the Derby with "Andover." Having bought Ackworth Park near Pontefract he was M.P. from December 1834 to July 1837. In 1862 he purchased the Wriggates Grange estate and collieries. Gully was twice married and had twelve children by each wife. He died at Durham on the 9th of March 1863. He appears to have been in no relation of the subsequent Speaker, Lord Selby.

GULPAIGN (Jerba'begàn of the Arab geographers), a district and city in Central Persia, situated N.W. of Isfahan and S.E. of Irák. Together with Khunisr it forms a small province, paying a yearly revenue of about $5,000. The city of Gulpaign is situated 87 m. N.W. of Isfahan, on the river Owan, 587 ft. in 33° 24' N. and 50° 20' E., and has a population of about 5,000. The district is fertile and produces much grain and some opium. Sometimes it is under the governor-general of the Isfahan province, at others it forms part of the province of Irák, and at times, as in 1906, is under a governor appointed from Teheran.

GUM (Fr. gomme, Lat. gommi, Gr. γομμυ, possibly a Coptic word; distinguishing "gum," the fleshy covering of the base of a tooth, in O. Eng. gôma, palate, cf. Ger. Gaumen, root of the mouth; the ultimate origin is probably the root gha, to open wide, seen in Gr. xai'ev, to gap, cf. "yawn"), the generic name given to a group of amorphous carbohydrates of the general formula (C₁₂H₂₀O₁₂), which exist in the juices of almost all plants, and also occur as exudations from stems, branches and fruits of plants. They are entirely soluble or soften in water, and form with it a thick glutinous liquid or mucilage. They yield mucic and oxalic acids when treated with nitric acid. In structure the gums are quite amorphous, being neither organized like starch nor crystallized like sugar. They are odourless and tasteless, and some yield clear aqueous solutions—the real gums, e.g. gum arabic, being insoluble and will not percolate filter paper, or the vegetable mucilages. The acacias and the Rosaceae yield their gums most abundantly when sickly and in an abnormal state, caused by a fulness of sap in the young tissues, whereby the new cells are softened and finally disorganized; the cavities thus formed fill with liquid, which exudes, dries and constitutes the gum.

Gum arabic may be taken as the type of the gums entirely soluble in water. Another variety, obtained from the Prosopsis dulcis, a leguminous plant, is called gum mesquite or mezquite; it comes from western Texas and Mexico, and is yellowish in colour, very brittle and quite soluble in water.

Gum arabic occurs in pieces of varying size, and some kinds are distinguished by the crude gangue or root of T. articulated (the purest variety) is 1.487, or, when dried at 100° C., 1.525. It is soluble in water to an indefinite extent; boiled with dilute sulphuric acid it is converted into the sugar galactose. Moderately strong nitric acid changes it into mucic acid and formic acid.

Under the influence of yeast it does not enter into the alcoholic fermentation, but M. P. E. Bertelot, by digesting with chalk and chabasite in solution a mixture of 100°. Its formula is (C₈H₁₂O₃)H₂O; and it forms compounds with nearly all bases which are easily soluble in water. Gummmic acid reddens litmus, its reagent st捧es about equal to carbonic acid. When solutions of gum arabic and gelatin are mixed, on standing or drying out, they form a gum like mass, which is insoluble in water.

The fierer varieties are used as an emollient and demulcent in medicine, and in the manufacture of confectionery; the commoner qualities are used as an adhesive paste, for giving lustre to crape, silk, &c., in cloth finishing to stiffen the fibres, and in calico-printing. For labels, &c., it is usual to mix sugar or glycerin with it to prevent it from cracking.

Gum senegal, a variety of gum arabic produced by Acacia senegal, which in profile is nearly round, of the size of a pigeon's egg, and of a reddish or yellow colour, and specific gravity 1.436. It gives with water a somewhat stronger mucilage than gum arabic, from which it is distinguished by its clear interior, fewer cracks and greater toughness. It is imported from the river Gambia, and from Senegal and Bathurst.

Chalalul gum, a variety brought from Santiago, Chile, resembles gum senegal. About 75% is soluble in water. Its solution is not thickened by borax, and is precipitated by neutral lead acetate; and dilute sulphuric acid converts it into d-glucose.

Astragalus, familiarly called gum dragon, exudes from the stem, the lower part especially, of various species of Astragalus, especially A. gummifer, and is collected on the Asia Minor, the chief port of shipment being Smyrna. Formerly only what exuded spontaneously was gathered; this was often of a brownish colour; but now the flow of the gum is aided by incisions cut near the root, and the product is the fine, white, flaky variety so much valued in commerce. The chief flow of gum takes place during the night, and hot and dry weather is the most favourable for its production.

In colour gum tragacanth is of a dull white; it occurs in hairy, flaky, wavy, thick, silky masses, having a wrinkled surface, and wavy lines on the surface. When dried at temperatures under 100° C., it loses about 14% of water, and is then easily powdered. Its specific gravity is 1.384. With water it swells by absorption, and
with even fifty times its weight of that liquid forms a thick mucilage. Part of it only is soluble in water, and the soluble gums gum tragacanth, being precipitated by alcohol and ammonium oxalate, but differs from it in giving a precipitate with neutral lead acetate and none with borax. The insoluble part of the gum is a calcium salt of bassorin (Ca2H6O6), which is devoid of taste and smell, forms a gelatinoid mass with water, but by continued boiling is rendered soluble.

Gum tragacanth is used in calico-printing as a thickener of colours and mordants; in medicine as a demulcent and vehicle for insoluble powders; and as an excipient in pills; and for setting and mending beetles and other insect specimens. It is medicinally superior to gum acacia, as it does not undergo acetic fermentation. The best pharmacopeial preparation is the *Mucilago Tragacanthae*. The compound powder is a useless preparation, as the starch it contains is very liable to fermentation.

Gum kuteera resembles in appearance gum tragacanth, for which the attempt has occasionally been made to substitute it. It is said to be the product of *Sterculia urens*, a plant of the natural order Sterculiaceae.

*Cherry tree gum* is an exudation from the trees of the genus *Prunus* and *Cornus*. It occurs in shiny reddish lumps, resembling the commoner kinds of gum arabic. With water, in which it is only partially soluble, it forms a thick mucilage. Sulphuric acid converts it into L-arabinose; and nitric acid oxidizes it to oxalic acid (without the intermediate formation of mucic acid as in the case of gum arabic).

*Gum of Bassora*, from Bassora or Bussorah in Asia, is sometimes imported into the London market under the name of the hoop-gum. It is insipid, crackles between the teeth, occurs in variable-sized pieces, is tough, of a yellowish-white colour, and opaque, and has properties similar to gum tragacanth. Its specific gravity is 1.36. It contains only 1% of soluble gum or arabin. Under the name of Caramania gum it is mixed with inferior kinds of gum tragacanth before exportation.

*Mucilage.*—Very many seeds, roots, &c., when infused in boiling water, yield mucilages which, for the most part, consist of bassorin. Linseed, quince seed and marshmallow root yield it in large quantity. In their reactions the different kinds of mucilage present different effects; e.g. quince seed yields only oxalic acid when treated with nitric acid, and with a solution of iodine in zinc iodide it gives, after some time, a beautiful red tint. Linseed does not give the latter reaction; by treatment with boiling nitric acid it yields mucic and oxalic acids.

*Gum Resins.*—This term is applied to the insipid, milky juices of certain plants, which consist of gum soluble in water, resin and essential oil, together with a small amount of mineral matter. They are generally opaque and solid, and often brittle. When finely powdered and rubbed down with water they form emulsions, the undissolved resin being suspended in the gum emulsion. They are employed as substitute for resin. Examples are: *Eucalyptus*, *Asafoetida*, *Buddleia, euphorbin, gamboge, myrrh, sagapana* and *scammony*.

GUßMEL, KARL WILHELM VON, BARON (1823-1898), German geologist, was born at Dannenfels, in the Palatinate of the Rhine, on the 11th of February 1823, and is known chiefly by his researches on the geology of Bavaria. He received a practical and scientific education in mining at Munich and Heidelberg, taking the degree of Ph.D. at Munich in 1862; and he was engaged for a time at the collery of St Inghert and as a surveyor in that district. In 1851, when the Geological Survey of Bavaria was instituted, Gußmel was appointed chief geologist; in 1863 he was made honorary professor of geognosy and surveying at the university of Munich, and in 1879, Oberberg director of the Bavarian mining department with which the Geological Survey was incorporated. His geological map of Bavaria was completed in 1878, and the official memoir descriptions of the detailed work, entitled *Geognostische Beschreibung des Königreiche Bayern* was issued in three parts (1861, 1868 and 1879). He subsequently published his *Geologie von Bayern* in 2 vols. (1884-1894), an elaborate treatise on geology, with special reference to the geology of Bavaria. In the course of his long and active career he engaged in much palaeontological work: he studied the fauna of the Tria, and in 1861 introduced the term Rhaetic for the uppermost division of that system; he supported at first the view of the organic nature of *Eosoon* (1866 and 1876), he devoted special attention to *Foraminifera*, and described those of the Eocene strata of the northern Alps (1866); he dealt also with *Receptaculites* (1875) which he regarded as a genus belonging to the *Foraminifera*. He died on the 18th of June 1898.

GUMBINNEN, a town of Germany, in the Prussian province of East Prussia, on the Pissa, an affluent of the Pregel, 22 m. by rail S.W. of Eydtkuhnen on the line to Königsberg. Pop. (1905), 14,194. The surrounding country is pleasant and fruitful, and the town has spacious and regular streets shaded by linden trees. It has a Roman Catholic and three Evangelical churches, a synagogue, a gymnasia, two public schools, a public library, a hospital and an inn. At the cemetery there is a statue of the king of Prussia Frederick William I., who in 1724 raised Gumbinnen to the rank of a town, and in 1732 brought to it a number of persons who had been driven from Salzburg by religious persecution. On the bridge over the Pissa a monument has been erected to the soldiers from the neighbourhood who fell in the Franco-German war of 1870-71. Iron founding and the manufacture of machinery, wool, cotton, and linen weaving, stocking-making, tanning, brewing and distilling are the principal industries. There are horse and cattle markets, and some trade in hops and linseed.

See J. Schneider, *Aus Gumbinnens Vergangenheit* (Gumbinnen, 1904).

GUMBO, or OKRA, termed also Okro, Ocho, Ketmia, Gumbo and Syrian mallow (Suns. *Tinidis*, Bengali *Dheras*, Pers. *Bamijah*, the *Bammia* of Prosper Alpinus; Fr. *Gombo*, or better *Gombo*, and *Ketmie comestible*), *Hibiscus esculentus*, a herbaceous hairy annual plant of the natural order *Malvaceae*, probably of African origin, and now naturalized or cultivated in all tropical countries. The leaves are cordate, and sometimes heart-shaped, and the flowers, yellow with a purple edge. The fruit or pod, the *Bendi-Kai* of the Europeans of southern India, is a tapering, 10-angled capsule, 4 to 10 in. in length, except in the dwarf varieties of the plant, and contains numerous oval dark-coloured seeds, hairy at the base. Three distinct varieties of the gombo (*Quinabo* and *Quinomogo*) in Brazil have been described by Pacheco. The unripe fruit is eaten either pickled or prepared like asparagus. It is also an ingredient in various dishes, e.g. the gombo of the Southern United States and the *calalou* of Jamaica; and on account of the large amount of iron it contains, it is extensively employed for making iron pots fresh and in the form of the prepared powder, for the thickening of broths and soups. For winter use it is salted or sliced and dried. The fruit is grown on a very large scale in the vicinity of Constantinople. It was one of the esculents of Egypt in the time of Abul-Abbas el-Nebati, who journeyed to Alexandria in 1216 (*Wüstenfeld, Gesch. d. arab. Artze*, p. 118, Gött., 1840), and is still cultivated by the Egyptians, who called it *Bammie*.

The seeds of the gombo are used as a substitute for coffee. From their demulcent and emollient properties, the leaves and immature fruit have long been in repute in the East for the preparation of poultices and fomentations. Alpinus (1592) mentions the employment of the decoction in Egypt in ophthalmia and in uterine and other complaints.

The musk okra (*Suns., Latikasturikd, cf. the Gr. καρωρ*; Bengali, *Lakiaksur*; Ger. *Bisamkornsirauch*; Fr. *Ketmie musquée*), *Hibiscus Abuelmochus* (*Abelmochus muscatus*), indigenous to India, and cultivated in most warm regions of the globe, is a suffruticous plant, bearing a conical 5-ridged pod about 3 in. in length, within which are numerous brown reniform seeds, smaller than those of *H. esculentus*. The seeds possess a musky odour, due to an oleo-resin present in the integument, and are known to perfumers under the name of *ambrette* as a substitute for musk. They are said to be used by the Arabs for scenting coffee. The seeds (in the Fantee language, *Incomats*) are used in Africa as beads; and powdered and steeped in rum they are valued in the West Indies as a remedy for snake-bites. The plant yields an excellent fibre, and, being rich in mucilage, is employed in Upper India for the clarifying of sugar. The best-perfumed okras are those cultivated in the Madras Presidency. See P. Alpinus, *De plantis Aegypti*, cap. xxviii, p. 38 (Venice, 1592); J. Sontheimer's *Abd Allah ibn Ahmad*, &c., i. 118 (Stuttgart, 1878).
GUMTI—GUN

Poppe, “Über die Aachenbestandteile der Samen von Acacia nilotica und Hibiscus esculentus in Ägypten,” Arch. der Pharm. ccxxv, p. 140 (1871); Drury, The Useful Plants of India, pp. 1, 2 (1871); U. C. Dutta, The Med. Mod. of the Hindus, pp. 123, 121 (1877); Lannecan, Hist. des drogues, i. 181–184 (1878); G. Watt, Dictionary of the Economic Products of India (1890).

GUMTI, a river of northern India. It rises in a depression in the Pilibhit district of the United Provinces, and after a sinuous but generally northerly course of 700 m. past Lucknow and Jaunpur joins the Ganges in Ghazipur district. At Jaunpur it joins the Chambal river, a 16th-century dynasty, and is navigable by vessels of 17 tons burden. There is also a small river of the same name in the Tippera district of eastern Bengal and Assam.

GUMULJINA, or Gumurdjina, a town of European Turkey, in the vilayet of Adrianople. Pop. (1905), about 3000, of whom three-fourths are Turks and the remainder Greeks, Jews or Armenians. Gumuljina is situated on the river Karaja-su, south of the eastern extremity of the Rhodope range of mountains and 40 m. inland from the Aegean Sea. It has a station on the railway between Salonica and Dédéagatch. The district produces wheat, maize, barley and tobacco; sericulture and viticulture are both practised on a limited scale. A cattle fair is held annually on Greek Palm Sunday. Copper and antimony are found in the neighbourhood.

GUMUS, or Gumz, Negroes of the Shangalla group of tribes, dwelling in the mountainous district of Fozogli on the Sudan-Abyssinian frontier. They live in independent groups, some being mountain-dwellers while others are settled on the banks of the Blue Nile. Gumz in the native tongue signifies “people,” and the sub-tribes have distinctive names. The Gumus are nature-worshippers, God and the sun being synonymous. On ceremonial occasions they carry parasols of honour (see SHANGALLA).

GUMUSH-KHANEH, the chief town of a sanjak of the same name in the Trebizond vilayet of Asiatic Turkey, situated on high ground (4400 ft.) in the valley of the Karsbût Su, about \( \frac{1}{4} \) m. to south of the Trebizond-Erzurum chaussée. The silver mines from which the place takes its name were noted in ancient times and are mentioned by Marco Polo. Pop. about 3000, chiefly Greeks, who are in the habit of emigrating to great distances to work in mines. They practically supply the whole lead- and silver-mining labour in Asiatic Turkey, and in consequence the Greek bishop of Gumush-Khaneh has under his jurisdiction all the communities engaged in this particular class of mines.

GUN, a general term for a weapon, tubular in form, from which a projectile is discharged by means of an explosive. When applied to artillery the word is confined to those pieces of ordnance which have a direct as opposed to a high-angle fire, in which case the terms “howitzer” and “mortar” are used (see Ordnance and Machine-Gun). “Gun” as applied to firearms which are carried in the hand and fired from the shoulder, the old “hand gun,” is now chiefly used of the sporting shot-gun, with which this article mainly deals; in military usage this type of weapon, whether rifle, carbine, &c., is known collectively as “small arms” (see Rifle and Pistols). The origin of the word, which in Mld. Eng. is gone or gunne, is obscure, but it has been suggested by Professor W. W. Skeat that it conceals a female name, Gunhildis or Gunhilda. The names, e.g. Mons Meg at Edinburgh Castle and Jane Grete (heavy Peg), known to readers of Carlyle’s Frederick the Great, will be familiar parallelisms. “Gunne” would be a shortened “pet name” of Gunhilde. The New English Dictionary finds support for the suggestion in the fact that in Old Norwegian gunne and hilde both mean “war,” and quotes an inventory of war material at Windsor Castle in 1330–1331, where it is mentioned “una magna balista de cornu quae vocatur Domina Gunilda.” Another suggestion for the origin of the word is that the word represents a shortened form, gone, of a supposed French mangonne, a mangonel, but the French word is mangeonae.

Firearms are said to have been first used in European warfare in the 14th century. The hand gun (see fig. 1) came into practical use in 1446 and was of very rude construction. It consisted of a simple iron or brass tube with a touch-hole at the top fixed in a straight stock of wood, the end of which passed under the right armpit when the “gone” was about to be fired. A similar weapon (see fig. 2) was also used by the horse-soldier, with a ring at the end of the stock, by which it was suspended by a cord round the neck; a forked rest, fitted by a ring to the saddlebow, served to steady the gun. This rest, when not in use, hung down in front of the rider, so that it was in the left hand. A match was made of cotton or hemp spun slack, and boiled in a strong solution of saltpetre or in the leaves of the herb called “Gumt,” which was then sold as an improvement in firearms took place in the first year of the reign of Henry VII., or at the close of Edward IV., by fixing a cock (Fr. serpenus) on the hand gun to hold the match, which was brought down to the priming by a trigger, whence the term matchlock. This weapon is still in use among the Chinese, Tatars, Turks, Persians and Turks. An improvement in the stock was also made during this period by forming it with a wide butt end to be placed against the right breast. Subsequently the stock was bent, a German invention, and the arm was called a backbutt or hagbut, and the smaller variety a demihagbut. The arquebus and backbutt were about a yard in length, including barrel and stock, and the demihagbut was about half the size and weight, the forerunner of the pistol. The arquebus was the standard infantry firearm in Europe from 1485 to 1558. In the battle of Pavia the introduction of the heavier and more powerful musket. It did not as a rule require a rest, as did the musket. The wheel-lock is an improvement on the matchlock, was invented in Nuremberg in 1517, was first used at the siege of Parma in 1521; and in continued in partial use there until the time of Charles II. This wheel-lock consisted of a fluted or grooved steel wheel which protruded into the priming pan, and was connected with a spring. The cock, also regulated by a spring, was fitted with a piece of iron pyrites. In order to discharge the gun the
lock was wound up by a key, the cock was let down on the
priming pan, the pyrites resting on the wheel; on the trigger
being pressed the wheel was released and rapidly revolved,
emitting sparks, which ignited the powder in the pan. The
complicated and expensive nature of this lock, with its liability
to injury, no doubt prevented its general adoption.

About 1540 the Spaniards constructed a larger and heavier
firearm (matchlock), carrying a ball of 10 to the pound, called
a musket. This weapon was introduced into England before
the middle of the 16th century, and soon came into general use
throughout Europe. The snaphance was invented about this
period in Germany, and from its comparative cheapness was
much used in England, France and Holland. It held a flint
instead of the pyrites of the wheel or firelock, which ignited
the powder in the pan by striking on a piece of furrowed steel, when
released by the trigger, and emitting sparks.

As a sporting weapon the gun may be said to date from the
invention of the wheel-lock in the beginning of the 16th century,
though firearms were used for sporting purposes in Italy, Spain,
Germany, and to some extent in France, in the 15th century.
Before that period the longbow in England and the crossbow on
the Continent were the usual weapons of the chase. In Great
Britain little use appears to have been made of firearms for game
shooting until the latter half of the 17th century, and the arms
then used for the purpose were entirely of foreign make.

The French gunmakers of St-Étienne claim for their town
that it is the oldest centre of the firearms industry. They do
not appear to have made more than the barrels of the finest
sporting arms, and these even were sometimes made in Paris.
The production of firearms by the artists of Paris reached its
zenith about the middle of the 17th century. The Italian,
German, Spanish and Russian gunsmiths also showed great
skill in the elegance and design of their firearms, the Spaniards
in particular being makers of fine barrels. The pistol (q.v.) is
understood to have been made for the first time about 1540 at
Pistoia in Italy. About 1635 the modern firelock or flint-lock
was invented, which only differed from the snaphance by the cover
of the pan forming part of the furrowed steel struck by the flint.
Originally the priming was put into the pan from a flask contain-
ing a fine-grained powder called serpentine powder. Later the
top of the cartridge was bitten off and the pan filled therefrom
before loading. The mechanism of the flint-lock muskets rendered
all this unnecessary, as, in loading, a portion of the charge passed
through the vent into the pan, where it was held by the cover or
hammer. The matchlock, as a military weapon, gradually gave
way to the firelock, which came into general use in the last half
of the 17th century, and was the weapon of Marlborough's and
Wellington's armies. This was the famous "Brown Bess" of the
British army. The highest development of the flint-lock is found
in the fowling-pieces of the end of the 18th and beginning of the
19th centuries, particularly those made by Joseph Manton, the
celebrated English gunsmith and inventor. The Napoleonic wars
afforded English gunmakers an opportunity, which they fully
utilized, of gaining the supremacy over their foreign competitors
in the gunmaking trade. English gunmakers reduced the weight,
improved the shooting powers, and perfected the lock mechanism
of the sporting gun, and increased the range and efficiency of the fire.

The transference of the gunmaking craft from the Continent
to England was also assisted by the tyranny of the foreign gunmaking gilds. In 1637 the
London gunmakers obtained their charter of incorporation. The important gunmaking
industry of Birmingham dates from 1603, and soon rivalled that of London. Double shot-
guns do not appear to have been generally used until the 19th century.
The first successful double guns were built with the barrels over and under, and
not side by side, and were invented about 1616 by one Guiseppe Bossi of
Rome. In 1784 double shot guns were described as a novelty. Joseph
Bossi patented the elevated rib which rested on the barrels.
The general success of the
double gun was eventually due to the light weight
which the better material and workmanship of the
best gunmakers made possible, and to the quickness
and certainty of ignition of the modern cartridge.
The objections to the flint-lock were that it did not
entirely preserve the priming from wet, and that
the flint sparks sometimes failed to ignite the charge.
In 1807 the Rev. Alexander
John Forsyth obtained a patent for priming with a
fulminating powder, made of chlorate of potash, sulphur and charcoal, which
exploded by concussion. This important improvement in firearms was not
recognized and adopted by the military authorities until more than thirty
years later. In the meantime it was gradually de-
developed, and the copper percussion cap invented,
by various gunmakers and private individuals.
Thomas Shaw of Phila-
delphia first used fulminate in a steel cap in 1814, which
he changed to a copper cap in 1816. It was not until
the introduction of the copper cap that the per-
cussion gun could be con-
sidered in every way superior to the flint. In
1834, in the reign of William
IV., Forsyth's invention was
tested at Woolwich by
firing 6000 rounds from six
flint-lock muskets, and a
similar number from six percussion muskets, in all weathers.
This trial established the percussion principle. The shooting was found to be more accurate, the recoil less, the charge of powder having been reduced from 6 to 4 1/2 drs., the rapidity of firing greater and the number of miss-fires much reduced, being as 1 to 26 nearly in favour of the percussion system. In consequence of this successful trial the military flint-lock in 1839 was altered to suit the percussion principle. This was easily accomplished by replacing the hammer and pan by a nipple with a hole through its centre to the vent or touch-hole, and by replacing the cock which held the flint by a smaller cock or hammer with a hollow to fit on the nipple when released by the trigger. On the nipple was placed the copper cap containing the detonating composition, now made of three parts of chlorate of potash, two of fulminate of mercury and one of powdered glass.

In 1840 the Austrian army was supplied with the percussion musket, and in 1842 a new model percussion musket with a block or back-sight for 150 yds. was issued to the British army, 11 lb 6 oz. in weight, 4 ft. 6 1/2 in. in length without bayonet, 6 ft. with bayonet and with a barrel 3 ft. 3 in. in length, firing a bullet of 14 1/2 to the lb with 4 1/2 drs. of powder. This musket was larger in bore than that of France, Belgium, Russia and Austria, and thus had the advantage of being able to fire their balls, while the English balls could not be fired from their barrels. But the greater weight and momentum of the English ball was counteracted by the excess of windage. This percussion musket of 1842, the latest development of the renowned Brown Bess, continued in use in the British army until partially superseded in 1851 by the Minié rifle, and altogether by the Enfield rifle...
in 1855. For further information as to the history and development of military, target and sporting rifles see Rif.

Illustrations are given of the growth of a German carbine of the 16th century, with double wheel-lock (fig. 8); a snaphance (fig. 9); several forms of the Brown Bess or flint-lock military musket (English, William III., fig. 10; George II., fig. 11; George III., fig. 12; French, fig. 13); and a number of percussion muskets, adopted by the British service in 1839 (fig. 14). Examples of non-European firearms are shown in figs. 6 and 7, representing a Moorish flint-lock and an Indian matchlock respectively. Figs. 15-18 represent various carbines, muskets, and blunderbusses, fig. 15 showing a small blunderbuss or musketoon of the early 18th century, fig. 16 a large blunderbuss of 1750, fig. 17 a flint-lock cavalry carbine of about 1785, and fig. 18 a percussion carbine of 1830. All these are drawn from arms in the museum of the Royal United Service Institution, London.

Modern Shot Guns.—The modern sporting breech-loaders may be said to have originated with the invention of the cartridge-case containing its own means of ignition. The breech-loading mechanism antedated the carbine by many years, the earliest breech-loading hand guns dating back to 1537. Another distinct type of breech-loader was invented in France about the middle of the 17th century. During the 17th and 18th centuries breech-loading revolvers were very numerous and of considerable size.

The original cartridge, a charge of powder and bullet in a paper envelope, dates from 1586. These were used with muzzle-loaders, the base of the cartridge being ripped or bitten off by the soldier before placing in the barrel. It was only when the detonating cap came into use that the paper cartridge answered well in breech-loaders. The modern breech-loader has resulted from a gradual series of improvements, and not from any one great invention. Its essential feature is the prevention of all escape of gas at the breech when the gun is fired by means of an expansive cartridge-case containing its own means of ignition. The earlier breech-loaders were not gas-tight, because the cartridge-cases were either consumable or the load was placed in a strong non-expansive breech-plug. The earliest efficient modern cartridge-case was the pin-fire, patented by Houiller, a Paris gunsmith, in 1847, with a thin weak shell which expanded by the force of the explosion, fitted perfectly in the barrel, and thus formed an efficient gas check. Probably no invention connected with firearms has wrought such changes in the principle of construction as those effected by the expansive cartridge-case.

This invention has completely revolutionised the art of gun-making, has been successfully applied to all descriptions of firearms, and has produced a new and important industry—that of cartridge manufacture.

About 1836, C. Lefauchez, a Paris gunsmith, improved the old Pyral system of breech-loading, but its breech action was a crude mechanism, with single grip worked by a bolster lever. The double grip for the barrels was the subsequent invention of a Birmingham gunmaker. The central-fire cartridge, practically as now in use, was introduced into England in 1861 by Daw. It is said to have been the invention of Pottet, of Paris, improved upon by Schneider, and gave rise to considerable litigation in respect of its patent rights. Daw, who controlled the English patents, was the only exhibitor of central-fire guns and cartridges at the International Exhibition of 1862. In his system the barrels work on a hinge joint, the bottom lever withdraws the holding-down bolt; the cartridge is of the modern type, the cap being detonated by a striker passing through the standing breech to the inner face. The cartridge-case is withdrawn by a sliding extractor fitted to the breech ends of the barrels. Daw was subsequently defeated in his control of the patents by Eley Bros., owing to the persistence of having been kept in force in France. The modern breech-loading gun has been gradually and steadily improved since 1860. Westley Richards adopted and improved Matthews' top-lever mechanism. About 1866 the rebounding lock was introduced, and improved in 1890. The treble wedge-fast mechanism for holding down the barrels was originated by W. W. Greener in 1865, and perfected in 1873. A very important improvement was the introduction of the hammerless gun, in which the mechanism for firing is placed entirely within the gun. This was made possible by the introduc-
barrel punt guns of 1½-in. bore, weighing 100 lb. While no conspicuous advance in improved gun-mechanism and invention has been made during the last few years, the materials and methods of manufacture, and the quality and exactitude of the gun-maker's work, have continued gradually and steadily to improve. English, and particularly London-made, guns are esteemed pre-eminently in the world. (H. S.-K.)

**GUNA**, a town and military station in Central India, in the state of Gwalior. Pop. (1901) 11,452. After the Mutiny, it became the headquarters of the Central India Horse, whose commanding officer acts as ex-officio assistant to the resident of Gwalior; and its trade has developed rapidly since the opening of a station on a branch of the Great Indian Peninsula railway in 1890.

**Guncotton**, an explosive substance produced by the action of strong nitric acid on cellulose at the ordinary temperature; chemically it is a nitrate of cellulose, or a mixture of nitrates, according to some authorities. The first step in the history of guncotton was made by T. J. Pelouze in 1838, who observed that when paper or cotton was immersed in cold concentrated nitric acid the materials, though not altered in physical appearance, became heavier, and after washing and drying were possessed of self-explosive properties. The time these products were thought to be related to the nitrated starch obtained a little previously by Henri Braconnot and called *xyleidin*; they are only related in so far as they are nitrates. C. F. Schönbein of Basel published his discovery of guncotton in 1846 (Phil. Mag. [3], 31, p. 7), and this was shortly after followed by investigations by R. R. Böttger of Frankfort and Otto and Knop, all of whom added to our knowledge of the subject, the last-named introducing the use of sulphuric acid along with nitric acid in the nitration-process.

The chemical composition and constitution of guncotton has been studied by a considerable number of chemists and many divergent views have been put forward on the subject. W. Crum was probably the first to recognize that some hydrogen atoms of the cellulose were replaced by nitro groups, and this view was supported more or less by other workers, especially Hadow, who appears to have distinctly recognized that at least three compounds were present, the most violently explosive of which constituted the main bulk of the product commonly obtained and known as guncotton. This particular product was insoluble in a mixture of ether and alcohol, and its composition could be expressed by the term tri-nitrocellulose. Other products were soluble in the ether-alcohol mixture: they were less highly nitrated, and constituted the so-called collodion guncotton.

The smallest empirical formula for cellulose (q.v.) may certainly be written \( \text{C}_6\text{H}_{10}\text{O}_5 \). How much of the hydrogen and oxygen are in the hydroxylic (OH) form cannot be absolutely stated, but from the study of the acetates at least three hydroxyl groups may be assumed. The oldest and perhaps most reasonable idea represents guncotton as cellulose trinitrate, but this has been much disputed, and various formulae, some based on cellulose as \( \text{C}_6\text{H}_{10}\text{O}_5 \), others on a still more complex molecule, have been proposed. The constitution of guncotton is a difficult matter to investigate, primarily on account of the very insoluble nature of the material itself, and also from the fact that comparatively slight variations in the concentration and temperature of the acids used produce considerable differences in the products. The nitrates are also very insoluble substances, all the so-called solvents merely converting them into jelly. No method has yet been devised by which the molecular weight can be ascertained.

The products of the action of nitric acid on cellulose are not nitro compounds in the sense that picric acid is, but are nitrates or nitric esters. Guncotton is made by immersing cleaned and dried cotton waste in a mixture of strong nitric and sulphuric acids. The relative amounts of the acids in the mixture and the time and the interval of treatment of the cotton varies somewhat in different works, but the underlying idea is the same, viz. employing such an excess of sulphuric over nitric that the latter will be rendered anhydrous or concentrated and maintained as such in solution in consequence. The sulphuric acid shall sufficiently strong to absorb and combine with the water produced during the actual formation of the guncotton. In the recent methods the cotton remains in contact with the acids for two to four hours at the ordinary air temperature (\( 15^\circ \text{C.} \)), in which time it is almost fully nitrated, the main portion, say 90\%, having a composition represented by the formula
\[
\text{C}_6\text{H}_{10}\text{O}_5(\text{NO}_3)_n,
\]
the remainder consisting of lower nitrated products, some oxidation products and traces of unchanged cellulose and cellulose sulphones. The acid is then slowly run out by an opening in the bottom of the pan, in which the operation is conducted, and water distributed carefully over its surface displaces it in the interstices of the cotton, which is finally subjected to a course of boiling and washing with water. This washing is a most important part of the process. On its thoroughness depends the removal of small quantities of products other than the nitrates, for instance, some sulphones and products from impurities contained in the original cellulose. Cellulose sulphones are one, and possibly the main, cause of instability in guncotton, and it is highly desirable that they should be completely hydrolysed and removed in the washing process. The idea is that any traces of acid not washed away by the washing process or produced later by a slow decomposition of the substance will be thereby neutralized and rendered harmless. Guncotton in an air-dry state, whether in the original form or after grinding to pulp and compressing, burns with very great rapidity but does not detonate unless confined.

Immediately after the discovery of guncotton Schönbein proposed its employment as a substitute for gunpowder, and General von Lenk carried out a lengthy and laborious series of experiments intending to adapt it especially for artillery use. All these and many subsequent attempts to utilize it, either loose or mechanically compressed in any way, signalised failed. However much compressed by mechanical means it is still a porous mass, and when it is confined as in a gun the flame and hot gases from the portion first ignited permeate the remainder, generally causing it actually to detonate, or to burn so rapidly that its action approaches detonation. The more closely it is confined the greater is the pressure set up by a small part of the charge burning, and the more completely will the explosion of the remaining mass be transmitted with its detonating effect. The idea is that any traces of acid not washed away by the washing process or produced later by a slow decomposition of the substance will be thereby neutralized and rendered harmless. Guncotton in an air-dry state, whether in the original form or after grinding to pulp and compressing, burns with very great rapidity but does not detonate unless confined.

When quite dry guncotton is easily detonated by a blow on an anvil or hard surface. If dry and warm it is much more sensitive to percussion or friction, and also becomes electrified by friction under those conditions. The amount of contained moisture exerts a considerable effect on its sensitiveness. With about 2\% of moisture it can still be detonated on an anvil, but the action is generally confined to the piece struck. As the quantity of contained water increases it becomes difficult or even impossible to detonate by an ordinary blow. Compressed dry guncotton is easily detonated by an initiative detonator such as mercuric fulminate. Guncotton containing more than 5\% of water is inflammable, may be compressed or worked without danger and is much more difficult to detonate by a fulminate detonator. The method of production of the mixed nitrocellulose described is very expensive, and the production of the mixed nitrocellulose is not made except on a large scale. The method of production of the mixed nitrocellulose described is very expensive, and the production of the mixed nitrocellulose is not made except on a large scale.

\[1\] The composition of the cellulose nitrates was reviewed by G. Lunge (Journ. Amer. Chem. Soc., 1901, 23, p. 527), who, assuming the formula \( \text{C}_6\text{H}_{10}\text{O}_5 \) to be the cellulose, and assuming that the cellulose is the only compound of the material, he expressed the cellulose by the formula \( \text{C}_6\text{H}_{10}\text{O}_5(\text{NO}_3)_n \), where \( n \) has the values 4, 5, 6, ... 12.

\[2\] This formula is retained mainly on account of its simplicity. It also expresses all that is necessary in this connexion.
detonator than water.

A small charge of dry guncotton will, however, ignite the wet material, and this peculiarity is made use of in the employment of guncotton for blasting purposes. A charge of compressed wet guncotton may be exploded, even under water, by the detonator, and the wet material is used in the dry mass form, which in turn can be started by a small fulminate detonator. The explosive wave from the dry guncotton primer is in fact better responded to by the wet compressed material than the dry; the charge is not exploded instantaneously, but at a rate comparable with that of the dry mass.

It is not necessary for the blocks of wet guncotton to be actually in contact if they be under water, and the peculiar explosive wave can also be conveyed along the surface of water. The reaction product of wet guncotton is a nearly saturated solution, and the peculiar composition of guncotton approaches that represented by $\text{CaH}_3\text{O}_7\text{N}_3\text{O}_8$; the more stable it is as regards storing at ordinary temperatures, and the higher the ignition temperature, the greater the content of guncotton after mixing with alcohol-ether until no more dissolves may require to be heated to 180-185°C before inflaming. Ordinary commercial guncottons, containing from 10 to 15% of lower nitrated products, will ignite by the detonator.

Assuming the above formula to represent guncotton, there is sufficient oxygen for internal combustion without any carbon being left. The gaseous products obtained by burning guncotton in a vacuum vessel contains steam, carbon monoxide, carbon dioxide, nitrogen, nitric oxide, and methane. When slowly heated in a vacuum vessel until ignition takes place, some nitrogen dioxide, NO₂, is evolved and dissolved in the rapidly-formed water, for some 70% of the gas is water. A considerable number of fatty acids, some bases, and glucose-like substances result. Under different pressures the relative amounts of the gases vary, but gaseous products in greatest quantity are carbon monoxide, steam and nitrogen are the main products, but nitric oxide never quite disappears.

Dilute mineral acids have little or no action on guncotton. Strong sulphuric acids, however, it decomposes the guncotton to the oxides of nitrogen, leaving a charred residue or a brown solution according to the quantity of acid. It sometimes fires on contact with strong sulphuric acid, especially when slightly warmed. The alkali hydroxides (e.g. sodium hydroxide) will in a solid state ignite on contact. Strong or weak solutions of these substances also decompose it, producing some alkali nitrate and nitrite, the cellulose merely being only partially restored, some portion undergoing oxidation. Ammonia is also active, but not quite in the same manner as the alkaline hydroxides. Guncotton heated in ammonia gas detonates at about 70°, and ammonium hydroxide solutions of all strengths having been tried, they did not cause the guncotton to detonate.

The alkali sulphhydrates reduce guncotton, or other nitratcelluloses, completely to cellulose. The production of the so-called “artificial silk” depends on this action.

A characteristic difference between guncotton and colloid cotton is the insolubility of the former in ether or alcohol or a mixture of these liquids. The so-called collodion cottons are nitratcelluloses, but of a lower degree of nitration (as a rule) than guncotton. They are sometimes spoken of as “lower” or “soluble” cottons or nitrates. The solubility in ether-alcohol may be owing to a lower degree of nitration, or to the temperature of the solution undergoing the process of nitration. If guncotton be correctly represented by the formula $\text{CaH}_{3}\text{O}_7\text{N}_3\text{O}_8$, it should contain a little more than 13% of nitrogen. Guncottons are examined for degree of nitration, and the result obtained in this way is confirmed by sulphuric acid in contact with mercury, and all the nitrogen is evolved as nitric oxide, NO, which is measured and the weight of its contained nitrogen calculated. Ordinary guncottons seldom contain more than 13% of nitrogen, and in most cases the amount does not exceed 12½%. Generally speaking, the lower the nitrogen content of a guncotton, as found by the nitrometer, the higher the percentage of matters soluble in a mixture of ether-alcohol. These soluble matters are usually considered as “lower” nitrates.

Guncottons are usually tested by the Abel heat test for stability (see Cordite). Another heat test, that of Will, consists in heating a weighed quantity of cotton in an iron crucible, heated to 120-130°C, passing the evolved gases over some red-hot copper, and finally collecting them over a solution of potassium hydroxide which retains the carbon dioxide and allows the nitric oxide arising from the guncotton decomposition to be measured. This is done at definite time intervals so that the rate of decomposition can be followed. The relative stability is then judged by the amount of nitrogen gas collected in a certain time. Several modifications of this and of the Abel heat test are also in use. (See Explosives.) (W. R. E. H.)

Gundulich, Ivan (1588-1638), known also as Giovanni Condola, Servian poet, was born at Ragusa on the 8th of January 1588. His father, Franco Gundulich, once the Ragusan envoy to Constantinople and councillor of the republic, gave him an excellent education. He studied the “humanities" with the Jesuit, Father Muzzi, and philosophy with Father Ricasoli. After that he studied Roman law and jurisprudence in general. He was member of the Lower Council and once served as the chief magistrate of the republic. He died on the 8th of December 1638. A born poet, he admired much the Italian poets of his time, from whom he received many translations into Servian. It is believed that he is the so translated Tasso's Gerusalemme Liberata. He is known to have written eighteen works, of which eleven were dramas, but of these only three have been fully preserved. Others having perished during the great earthquake and fire in 1667. Most of those dramas were translations from the Italian, and were played, seeming with great success, by the amateurs furnished by the noble families of Ragusa. But his greatest and justly celebrated work is an epic, entitled Osman, in twenty cantos.

It is the first political epic on the Eastern Question, glorifying the victory of the Poles over Turks and Tatars in the battle of Parnawa in 1514, and the exploits of the Polish nations, under the guidance of Vladislaus, the king of Poland, for the purpose of driving away the Turks from Europe. The fourteenth and fifteenth cantos are lost. It is generally believed that the Ragusan government suppressed them from consideration for the Sultan, the protector of the republic, those two cantos having been violently anti-Turkish.

Osman was printed for the first time in Ragusa in 1826, the two missing cantos being replaced by songs written by Pietro Sorgo (or Sorkochevich). From this edition the learned Italian, Francesco Appendini, made an Italian translation published in 1827. Since that time several other editions have been made. The best are contained in the edition of the South Slavonic Academy in Agram (1877) and the edition published in Semlin (1899) by Professor Yovan Boshkovich.

In the edition of 1844 (Agram) the last cantos, fourteen and fifteen, were printed for the first time. The Ionian poet, Mazhuranich (Mazhuranic). The complete works of Gundulich have been published in Agram, 1847, by V. Babukich and by the South Slavonic Academy of Agram in 1889.

Guncz'l, Joseph (1819-1889), Hungarian composer and conductor, was born on the 1st of December 1819, at Zasmbek, in Hungary. After starting life as a school-teacher, and learning the elements of music from Ofen, the school-master, he became first oboist at Graz, and, at twenty-five, bandmaster of the 4th regiment of Austrian artillery. His first composition, a Hungarian march, written in 1836, attracted some notice, and in 1843 he was able to establish an orchestra in Berlin. With this band he travelled far, even in (1849) to America. It is worth recording that Mendelssohn's complete Midsummer Night's Dream music is said to have been first played by Gungz'l's band.

In 1853 he became bandmaster to the 23rd Infantry Regiment at Brünn, but in 1864 he lived at Munich, and in 1876 at Frankfort, after (in 1873) having conducted with great success a series of promenade concerts at Covent Garden, London. From Frankfort Gung'l went to Weimar to live with his daughter, a well-known German opera singer and local prima donna. There he died, on the 31st of January 1889. Gung'l's dances number over 300, perhaps the most popular being the "Amoretten," "Hydropaten," "Casino," "Dreams on the Ocean," waltzes; "In Stiller Mitternacht" polka, and "Blue Violets" mazurka. His Hungarian march was transcribed by Liszt. His music is characterized by the same easy flowing melodies and well-marked rhythm that distinguish the dances of Strauss, to whom alone he can be ranked second in this kind of composition.

Gunner, or Master Gunner, in the navy, the warrant officer who has charge of the ordnance and ammunition, and of the training of the men at gun drill. His functions in this respect are of less relative importance than they were in former times, when specially trained corps of seamen gunners had not been formed.

Gunning, Peter (1614-1684), English divine, was born at Hoo, in Kent, and educated at the King's School, Canterbury, and Clare College, Cambridge, where he became a fellow in 1633. Having taken orders, he advocated the royalist cause from the pulpit with much eloquence. In 1644 he retired to Oxford, and held a chaplaincy at New College until the city surrendered to the parliamentary forces in 1646. Subsequently he was chaplain, first to the royalist Sir Robert Shirley of Eastington (1629-1656), and then at the Exeter House chapel. After the
Restoration in 1660 he returned to Clare College as master, and was appointed Lady Margaret professor of divinity. He also received the livings of Cottesmore, Rutlandshire, and Stoke Bruerne, Northamptonshire. In 1661 he became head of St John's College, Cambridge, and was elected Regius professor of divinity. He was consecrated bishop of Chichester in 1669, and was translated to the see of Ely in 1674–1675. Holding moderate views, he was twice called upon to take the oath of allegiance, first as bishop, and second as archbishop. In foreign affairs he remained an isolationist. On several occasions he attempted to mediate between parties of the extremes, represented by Puritanism and Roman Catholicism.

His works are chiefly reports of his disputations, such as that which appears in the Scisme Unmask't (Paris, 1568), in which the definition of a schism is discussed with two Romanist opponents.

**GUNNY,** a sort of cloth, the name of which is supposed to be derived from ganga or gania of Rumphius, or from gonia, a vernacular name of the Draba falvacea— a plant common in Madras. One of the first notices of the term itself is to be found in Knox's Cyclopaedia, in which he says: "The filaments at the bottom of the boll (coir from the coco-nut husk, Cocos nucifera) may be made into a coarse cloth called gunny, which is used for bags and similar purposes."

Warden, in The Linen Trade, says:

"A very large proportion of the jute grown in Bengal is made into cloth in the districts where it is cultivated, and this industry forms the most important among the numerous occupations of the east of Bengal. It pervades all classes, and penetrates into every household, almost every one, man, woman and child, being in some way engaged in it. Boatsmen, husbandmen, palankeen carriers, domestic servants, women, beggars and soldiers, being Hindu—two Mussalmans spin cotton in the very temple where the holy books are kept. Only—pass their leisure moments, distaff in hand, spinning gunny twist. It is spun by the takur and dhara, the former being a kind of wheel, which is turned upon the thigh or the sole of the foot, and the latter a reel, on which the thread, when sufficiently twisted, is wound up. Another kind of spinning machine, called a churghureen, is occasionally used. A bunch of the raw material is hung up in every farmer's house, or on the protruding stick of a thatched roof, and every one who has leisure forms with these spindles some coarse pack-thread, of which ropes are twisted for the use of the farm. The thread of so-called 'gunny' is the finest the hand can spin, a finer thread found in the world eyed, woven into a loom in nearly every house, very much of it is woven by the women of the lower class of people. It is especially the employment of the Hindu widow, as it enables her to earn her bread without being a burthen on her family.

The cloth thus made is of various qualities, such as clothing for the family (especially the women, a great proportion of whom on all the eastern frontier wear almost nothing else), coarse fabrics, bedding, rope and sugar bags, sacking, pack-sheets, &c. Much of it is woven in short lengths and very narrow widths, two or three of which are sometimes sewed into one piece before they are sold. That intended for ropes and sacks is kept from about 4 feet wide to 2 feet wide, and doubled. A considerable quantity of jute yarn is dyed and woven into cloth for various local purposes, and some of it is sold out of the district. The principal places where choote, or jute cloth, is exported are Calcutta, Chinsurah and Serampore, and, being within 200 miles around Dacca, and there both labour and land are remarkably cheap. The short, staple, common jute is generally consumed in the manufacture, the finer and longer stapled being reserved for the export trade. These causes enable gunny cloth and bags to be sold almost as cheaply as the raw material, which creates an immense demand for them in nearly every market of the world."

Such appeared to be the definition of gunny cloth at the time the above was written—between 1850 and 1860. Most of the Indian cloth for gunny bags is now made by power, and within about 20 m. of Calcutta. In many respects the term gunny cloth is misleading. The term is now applied even to the burlap when cut up, and there is no doubt that the original name was intended for cloth which was similar to what is now known as "cotton bagging." This particular type of cloth is still largely made in the hand loom, even in Dundee, this method of manufacture being considered, for certain reasons, more satisfactory than the power loom method (see Jute and Bagging).

**Gunpowder,** an explosive composed of saltpetre, charcoal and sulphur. Very few substances have had a greater effect on civilization than gunpowder. Its employment altered the whole art of war, and its influence gradually and indirectly pervaded and affected the whole fabric of society. Its discovery was probably due to a mixture of saltpetre, charcoal and sulphur, though the precise proportions are unknown. The effect on the arts of peace was but slight, and had but a limited range, which could not be compared to the modern extended employment of high explosives for blasting in mining and engineering work.

It is probably quite incorrect to speak of the discovery of gunpowder. From modern researches it seems more likely and more just to think of it as a thing that has developed, passing through many stages—mainly of improvement, but some undoubtedly retrograde. There really is not sufficient solid evidence on which to pin down its invention to one man. As Lieutenant-Colonel H. W. L. Hime (Gunpowder and Ammunition, 1904) says, the invention of gunpowder was impossible until the properties of nearly pure saltpetre had become known. The honour, however, has been associated with two names in particular, Berthold Schwartz, a German monk, and Friar Roger Bacon. Of the former Oscar Guttmann writes (Monumenta pulveris pyriti, 1904, p. 6): "Berthold Schwartz was generally considered to be the inventor of gunpowder, and only in England has Roger Bacon's claim been upheld, though there are English writers who have pleaded in favour of Schwartz. Most writers are agreed that Schwartz invented the first fire-arms, and as nothing was known of an inventor of gunpowder, it was perhaps considered justifiable to give Schwartz the credit thereof. There is some ambiguity as to when Schwartz lived. The year 1354 is sometimes mentioned as the date of his invention of powder, and this is also to be inferred from an inscription on the monument to him in Freiburg. But considering there can be no doubt as to the manufacture in England of gunpowder and cannon in 1344, that we have authentic information of guns in France in 1338 and in Florence in 1326, and that the Oxford MS. De officiis regum of 1325 gives an illustration of a gun, Berthold Schwartz must have lived long before 1354 to have been the inventor of gunpowder or guns." In Germany also there were powder-works at Augsburg in 1340, in Spandau in 1344, and Liegnitz in 1348.

Roger Bacon, in his De mirabili potestate artis et naturae (1247), makes the most important communication on the history of gunpowder. Reference is made to an explosive mixture as known before his time and employed for "diversion, producing a noise like thunder and flashes like lightning." In one passage Bacon speaks of saltpetre as a violent explosive, but there is no doubt that he knew it was not a self-explosive substance, but only so when mixed with other substances, as appears from the statement in De secretis operibus artis et naturae, printed at Hamburg in 1618, that "from saltpetre and other ingredients we are able to make a fire that shall burn at any distance we please." A great part of his three chapters, 10, 11, long appeared without meaning until the anagrammatic nature of the sentences was realized. The words of this anagram are (chap. 11): "Item ponderis totum 30 sed tamen solis petrae lurum vigo vir con uiri et sulphuris; et sic facies tonitrum et coruscaciam, si subs diem esse, uae aut secundum vitametum."—Hime, in his chapter on the origin of gunpowder, discusses these chapters at length, and gives, omitting the anagram, the translation: "Let the total weight of the ingredients be 30, however, of saltpetre... of sulphur; and with such a mixture you will produce a bright flash and a thundering noise, if you know the trick. You may find (by actual experiment) whether I am writing riddles to you or the plain truth." The anagram reads, according to Hime, "salis petrae r(ecipe) vii part(is), v nov(ellae) coruli, v et sulphuris." It was further associated with scholars (e.g., Vincenti tamen utrum loquere ad 350 to have been the inventor of gunpowder or guns.) In Germany also there were powder-works at Augsburg in 1340, in Spandau in 1344, and Liegnitz in 1348.
he employed his comparatively pure saltpetre instead of crude nitre. It has been suggested that Bacon derived his knowledge of these fiery mixtures from the MS. Liber ignitum, ascribed to Marcus Graecus, in the National Library in Paris (Duten's, Enquiry into Origin of Discoveries attributed to Moderns). Certainly this Marcus Graecus appears to have known of some incendiary composition containing the gunpowder ingredients, but it was not gunpowder. Hime seems to doubt the existence of any such person as Marcus Graecus, as he says: "The Liber ignitum was written from first to last in the period of literary forgeries and pseudographs... and we may reasonably conclude that Marcus Graecus is a name used as the imaginary Greek original, under which bear his name." Magnus in the De mirabilibus mundi repeats some of the receipts given in Marcus Graecus, and several other writers give receipts for Greek fire, rockets, &c. Dutens gives many passages in his work, above-named, from old authors in support of his view that a composition of the nature of gunpowder was not unknown to the ancients. Hime's elaborate arguments go to show that these compositions could only have been of the incendiary type and not real explosives. His arguments seem to hold good as regards mixtures of this kind but also the Arabs, Hindus and Chinese (see also Fireworks).

There seems no doubt that incendiary compositions, some perhaps containing nitre, mostly, however, simply combustible substances as sulphur, naphtha, resins, &c., were employed and projected both for defence and offence, but they were projected or blown by engines and not by themselves. It is quite conceivable that a real propelling explosive should have been known in the time of Alexander or much later, and not have immediately taken its proper place. In a chapter discussing this question of explosives amongst the Hindus, Hime says: "...the needlessness to enlarge the list of quotations: incendiaries pursued much the same course in Upper India as in Greece and Arabia..." No trustworthy evidence of an explosive in India is to be found until the 21st of April 1326, the day of the decisive battle of Panipat, in which Ibrahim, sultan of Delhi, was killed and his army routed by Baber the Mogul, who possessed both great and small fire-arms.

As regards also the crusader period (1097-1291), so strange and deadly an agent of destruction as gunpowder could not possibly have been employed in the field without the full knowledge of both parties. Yet no historian, Christian or Moslem, alludes to an explosive of any kind, while all of them carefully record the use of incendiaries. The employment of rockets and "wildfire" incendiary composition seems undoubtedly of very old date in India, but the names given to pieces of artillery under the Mogul conquer of Hindustan point to a European, or at least to a Turkish origin, and it is quite certain that Europeans were retained in the service of Akbar and Aurungzeb.

The composition of present day Chinese gunpowder is almost identical with that employed in Europe, so that in all probability the knowledge of it was obtained from Western sources.

In the writings of Bacon there is no mention of guns or the use of powder as a propellant, but merely as an explosive and destructive power. Owing perhaps to this obscurity hanging over the early history of gunpowder, its employment as a propelling agent has been ascribed to the Moors or Saracens. J. A. Conde (Historia de la dominacion de los Arabes en España) states that Ismall Ben Firaz, king of Granada, who in 1325 besieged Boza, had among his machines some that cast globes of fire; but there is not the least evidence that these were guns. The first trustworthy document relative to the use of gunpowder in Europe, a document still in existence, and bearing date February 11, 1326, gives authority to the council of twelve of Florence and others to appoint persons to superintend the manufacture of cannons of brass and iron balls, for the defence of the territory, &c., of the republic. John Barbour, arch-deacon of Aberdeen, writing in 1375, states that cannons (crakys of war) were employed in Edward III.'s invasion of Scotland in 1337. An indenture first published by Sir N. H. Nicolas in his History of the Royal Navy (London, 1840), and again by Lieutenant-Colonel H. Brackeney (Proc. R. A. Inst., 1853), stated to be 1338, contains references to small cannon as among the stores for the Tower. "I will powder the goopupde le quart plein." If authentic, this is possibly the first mention of gunpowder, as such in England, but some doubts have been thrown upon the day of this MS. From a contemporary document in the National Library in Paris it seems that in the same year (1338) there existed in the marine arsenal at Rouen an iron weapon called pot de fèn, for propelling bolts, together with some saltpetre and sulphur to make powder for the same. Preserved in the Record Office in London are trustworthy accounts from the year 1345 of the purchase of ingredients for gunpowder by the French navy, among which is "material to make Brest." In 1346 Edward III. appears to have ordered all available saltpetre and sulphur to be bought up for him. In the first year of Richard II. (1377) Thomas Norbury was ordered to buy, amongst other munitions, sulphur, saltpetre and coal, to be sent to the castle of Brest. In 1414 Henry V. ordered that no gunpowder should be taken out of the kingdom, without special licence, and in the same year ordered twenty pipes of willow charcoal and other articles for the use of the garrison.

The manufacture of gunpowder seems to have been carried on as a crown monopoly about the time of Elizabeth, and regulations respecting gunpowder and nitre were made about 1623 (James I.). Powder-mills were probably in existence at Waltham Abbey about the middle or towards the end of the 16th century.

Ingredients and their Action.—Roger Bacon in his anagram gives the first real recipe for gunpowder, viz. (according to Hime, ch. xii.) saltpetre 41-2, charcoal 29-4, sulphur 29-4. Dr John Arderne of Newark, who began to practise about 1350 and was later surgeon to Henry IV., gives a recipe (Sloane MSS. 325, 795), saltpetre 66-6, charcoal 57-7, sulphur 13-3, which are to be thoroughly mixed on a marble and then sifted through a cloth. This powder is nominally of the same composition as one given in a MS. of Marcus Graecus, but the saltpetre of this formula by Marcus Graecus was undoubtedly ammoniacal. At the difference of the two, and in the belief that Roger Bacon had not only refined and obtained pure nitre, but had appreciated the importance of thoroughly mixing the components of the powder. Most if not all the early powders were a loose mixture of the three ingredients, and the most important step in connexion with the development of gunpowder was undoubtedly the introduction of wet mixing or incorporating. Whenever this was done, the improvement in the product must have been immediately evident. In the damp or wetted state pressure could be applied with comparative safety during the mixing. The loose powder mixture came to be called serpentine; after wet mixing it was more or less granulated or formed into balls or cakes, which had been gradually introduced. It is mentioned in the Fire Boock of Conrad von Schongau (in 1420), and was used for hand-guns and long guns of the 15th century. It was also used for hand-guns or small arms in the 15th century, but cannon were not made strong enough to withstand its explosion for quite another century (Hume). According to the same writer, in the period 1250-1500, when serpentine only was used, one powder could differ from another in the proportions of the ingredients; in the modern period—say 1700-1899—the powders in use (in each state) differed only as a general rule in the size of the grain, while during the transition period—1450-1700—they generally differed both in composition and size of grain.

Corned or grained powder was adopted in France in 1525, and in 1540 the French utilized an observation that large-grained powder was the best for cannon, and restricted the manufacture to three sizes of grain or corn, possibly of the same composition. Early in the 18th century two or three sizes of grain and powder of one composition appear to have become common. The composition of English powder seems to have settled down to 75 nitre, 15 charcoal, and 10 sulphur, somewhere about the middle of the 18th century.

The compositions of these gunpowders used in different countries at different times is illustrated in the following table:

Charcoal 16-5 26-1 23-2 13-6 17 19
Sulphur 25 16-5 21-7 8-5 10 11

1 Brown or coco-powder for large charges in guns. The charcoal is not burnt black but roasted until brown, and is made from some variety of straw, not wood.

When reasonably pure, none of the ingredients of gunpowder absorbs any material quantity of moisture from the atmosphere, and the nitre only is a soluble substance. It seems extremely probable that a very long time must be employed in drying properly mixed dry, indeed sometimes kept separate and mixed just before being required; the consequence must have been, that with every care as to weighing out, the proportions of any given quantity would alter a little on charging. The sulphur, though considerably heavier than charcoal or charcoal, and would tend to separate out towards the bottom of the containing vessel if subjected to jolting or vibration. When pure there can only be one kind of saltpetre. Sulphur is considerably heavier than charcoal or charcoal, and would tend to separate out towards the bottom of the containing vessel if subjected to jolting or vibration.

Properties of Ingredients.—Charcoal is the chief combustible in powder. It must burn freely, leaving as little ash or residue as possible; it must be friable, and grind into a non-gritty powder. The sources from which this powder is made are dogwood (Rhhamnus frangula), willow (Salix alba), and alder (Betula alnus). Dogwood charcoal is the best, and especially valuable, as it can be obtained from which it is made contain carbon, hydrogen and oxygen, and, the two latter are never thoroughly expelled in charcoal-making. If they were, the resulting substance would be of no use for gunpowder, due to the 3% of moisture and oxygen which remain in charcoal suitable for gunpowder, a good deal of the heiness and violence of explosion of a gunpowder depends on the moisture in the charcoal as well as on the wood from which it is made.

Potassium nitrate is eminently suitable as an oxygen-provider, not being deliquescent. Nitrates are continually being produced in surface soils, &c., by the oxidation of nitrogenous substances. Nitric and nitrous acids are also produced by electric discharges through the atmosphere, and these are found eventually as nitrates in soils, &c. Nitre is soluble in water, and much more so in hot than in cold; the cryolite obtained from some of the black, and the crystalized and ground, and the powder sifted on a rotating reel or cylinder of fine mesh copper-wire gauze. The sifted powder is again stored for some time before use in closed iron vessels.

The mechanical action of rollers on the powder paste is a double one: not only by the force of pressure, but by pushing forwards and twisting sideways. The pasty mass is deflected so that it repeats the curvature of the roller and then the next by scrapers, set at an angle to the bed, which follow each wheel.

The thorough charge is wet and it is possible for it to be fired either by the heat developed by the roller friction, by sparks from foreign matters, as bits of wood or stone, or by the general heat of the box. The mills are provided with a draining apparatus so arranged that in case of one mill failing it and its neighbors stop current. In the mill itself, the powder is introduced into slightly above the mill. The product from the incorporation is termed "mill-cake." After this incorporation in the damp state the ingredients never completely set; the density of the powder is 1.2 to 1.4 and tend to put a great strain on the gun. Fouling is usually less with denser powders; and, as would be expected, such powders bear transport better and give less dust than light powders. Up to a certain pressure, hardness of the powder will not improve their ability to give a better shot, and will change have an effect on the rate of burning and therefore on pressure. Glazing or polishing powder grains, also exerts a slight retarding action on burning. Burning is greater with powders with a better powder moisture better. Excess of moisture in gunpowder has a marked effect in reducing the explosiveness. All powders are liable to absorb moisture, the quality and kind of charcoal being the main determinant in this respect; hard burnt black charcoal is least absorbent. The material employed in brown powders absorbs moisture somewhat readily. Powder kept in a very damp atmosphere, especially in brown powders, will absorb moisture and powder coming to the surface in solution and then crystallizing out. The pieces also break up owing to the formation of large crystals of nitre in the mass. After the pressing of the incorporated powder into a mass of 3,000 pounds, the powder is cut up into smaller sizes, separated from the remaining charcoal, and the resulting grains separated and sorted by sieving through sieves of determined sizes of mesh.

Shape.—Prisms or prismatic powder are made by breaking up the press-cake into a moderately fine state, whilst still moist; the moisture present causes the powder to swell, and it is generally employed consist of a thick plate of bronze in which are a number of hexagonal perforations. Accurately fitting plungers are so applied to these that one can enter at the top and the other at the bottom of the plate, and the inner surface of the plate the hexagonal hole is charged with the powder and the two plungers set in motion, thus compressing the powder between them. The upper plunger is withdrawn, and the lower one pushed upward to eject the prism of powder. The axial perforations in prism powders are made by small bronze rods which pass through the lower plunger and fit into corresponding holes in the upper one. If these prisms are made by a steadily applied pressure a density throughout of about 1.78 may be obtained. Further to regulate the rate of burning so as to generally be lower, with source of nitre is added, condensed, another form of machine was devised, the cap press, in which the pressure is applied very rapidly to the powder. It receives in fact one blow, which compresses the powder to the same dimensions, but the density of the outer layers of substance of the prism is much greater than in the interior.

The leading idea in connexion with all shaped powder grains, and with the very large sizes, was to regulate the rate of burning so as to prevent the gun being fired. A pressure in the gun as more space was provided in the chamber or tube by the movement of the shot towards the muzzle. In the perforated prismatic powder the powder is filled by the powder through the perforations; since in a charge the faces of the prisms fit pretty closely together, it was thought that this arrangement would prevent unburnt cores or pieces of powder from being blown into the larger spaces in the gun. It is generally impossible to take advantage of the slower production of gases and complete combustion of the powder. General T. J. Rodman first suggested and employed the perforated powder in the civil war 1860, the cake having nearly the diameter of the bore and a thickness of 1 to 2 in.
with perforations running parallel with the gun axis. The burning would then start from the comparatively small surfaces of the perforations, which would become larger as the powder buries away. Experiments borne out this theory perfectly. It was found that small prisms were more convenient to make than large disks, and as the prisms practically fit together into a disk the same result was obtained. This effect of mechanical density on rate of burning is good only up to a certain pressure, above which the gases are driven through the densest form of granular material. After granulating or pressing into shapes, all powders must be dried. This is done by heating in specially ventilated rooms heated by steam pipes. As a rule this drying is followed by the finishing or polishing process. Powders are finally blended, i.e. products from different batches or "makes" are mixed so that identical proof results are obtained.

Sizes and Shapes of Powders.—In fig. 1, a to k show the relative sizes and shapes of grain as formerly employed for military purposes except that the three largest powders, e-f-g and k are figured half-size to save space, whereas the remainder indicate the actual dimensions of the grains. a is for small-arms, all the others are for cannon of various sizes.

**Fig. 1.**

Proof of Powder.—In addition to chemical examination powder is passed through certain mechanical tests

1. For colour, glaze, texture and freedom from dust.
2. For proper incorporation.
3. For equal proportion of the grains.—The first is judged by eye, and grains of the size required are obtained by the use of sieves of different sizes.
4. Density.—The density is generally obtained in some form of mercury densimeter, the powder being weighed in air and then under mercury. In some forms of the instrument the air can be pumped out so that the weighing takes place in vacuo.
5. Moisture and absorption of moisture.—The moisture and hygroscopic test consists in weighing a sample, drying at 100° C, for a certain time, weighing again, &c., until constant. The dried weighed sample can then be exposed to an artificial atmosphere of known moisture and temperature, and the gain in weight per hour similarly ascertained by periodic weighings.
6. Firing proof.—The nature of this depends upon the purpose for which the powder is intended. For sporting powders it consists in the "pattern" given by the shot upon a target at a given distance or, if fired with a bullet, upon the "figure of merit," or mean radial deviation of a certain number of rounds; also upon the penetrative power. For military purposes the "muzzle" velocity produced by a powder is ascertained by a chronograph which measures the velocity of the bullet or other projectile, being at a known distance between two wire screens. By means of "crusher gauges" the exact pressure per square inch upon certain points in the interior of the bore can be found.

The chemical examination of gunpowder the points to be ascertained are, in addition to moisture, freedom from chlorides or sulphates, and correct proportion of nitre and sulphur to charcoal. (See Fired Powder and Chemical Testing.)

With a mixture of the complexity of gunpowder it is quite impossible to say beforehand what will be the relative amounts of products. The desired products are nitrogen and carbon dioxide as gases, and potassium and carbonates as solids. But the products of the mixture are not in any simple chemical proportion. Burning in contact with air under one atmosphere pressure, and burning in a closed or partially closed vessel under a variable pressure of atmospheres pressure, may produce quite different results. The pressure of a temperature always rises with increased pressure. Although the main function of the nitre is to give up oxygen and nitrogen, of the charcoal to produce carbon dioxide and most of the heat, and of the sulphur by vaporizing to accelerate the rate of burning, it is quite impossible to represent the actions taking place on explosion by any simple or single chemical equation. Roughly speaking, the gases from black powder burned in a closed vessel have a volume at 0° C, and 760 mm. pressure of about 280 times that of the original powder. The temperature produced under one atmospheric pressure above 2000° C, and under greater pressures considerably higher.

Experiments have been made by Benjamin Robins (1743), Charles Hutton (1778), Count Rumford (1797), Gay-Lussac (1823), R. Bunsen and L. (1861), Off (1857), T. J. Rodman (1863), and later many researches by Sir Andrew Noble and Sir F. A. Abel, and by H. Debus and others, all with the idea of getting at the principal mechanical or expansion. Debus (1882, vol. 213, 1891, vol. 265) discussed at great length the results of researches by Bunsen, Karolyi, Noble, and Abel, and others on the combustion of powder in closed vessels in such manner that all the products could be collected and examined and the pressures registered. A Waltham Abbey powder, according to an experiment by Noble and Abel, gave when fired in a closed vessel the following quantities of products calculated from one gram of powder:

<table>

From this, and other results, Debus concluded that a Waltham Abbey powder could be represented by the formula 16KNO3 + 22C + 8S = 5K2CO3 + 5K2S + 2K2S2 + 13CO2 + 4SO2 + 8N2 + 0.66S and that on combustion in a closed vessel the end results could be fairly expressed (rounding off fractions) by 16KNO3 + 21C + 8S = 5K2CO3 + 5K2S + 2K2S2 + 13CO2 + 4SO2 + 8N2. Some of the sulphur is lost, part combining with the metal of the apparatus and part with hydrogen in the charcoal. The military powders of most nations can be represented by the formula 16KNO3 + 24C + 8S, proportions which are reasonably near to a theoretical mixture, that is one giving most complete combustion, greatest gas volume and temperature. The combustion of powder consists of two processes: (i) oxidation, during which potassium carbonate and sodium carbonate are mainly produced; and (ii) a reduction process in which free carbon acts on the potassium sulphate and free sulphur on the potassium carbonate, producing potash sulphate and carbon mostly reduced to charcoal. Most powders contain more carbon and sulphur than necessary, hence the second stage. In this second stage heat is lost. The potassium sulphate is also the most objectionable constituent as regards fouling. The theory of a powder is given according to the shot, by multiplying the gas volume by the heat (in calories) produced during burning; Debus shows that a powder composed of 16KNO3 to 8C and 8S has a heat of 8475, and a composition 16KNO3 + 24C + 16S the greatest, when completely burned. The greatest capability with the lowest proportion of carbon and sulphur to nitre would be obtained from the mixture +10KNO3 + 22C + 8S. Some of the powders and even硝 lead were long sought for during the whole gunpowder period. In 1756 one was experimented with in France, but was abandoned owing to difficulties with loading. Modern smokeless powders are certainly less noisy than the black powders, mainly because of the absence of metallic salts which although they may be gaseous whilst in the gun are...
certainly ejected as solids or become solids at the moment of contact with air.

Brown Powders.—About the middle of the 16th century gun- and propulsion powders were much heavier and more dense than previously, and it was soon found that the ordinary black powders of the most dense form burnt much too rapidly, straining or bursting the pieces. Powders were introduced containing about 56% of sulphur, 10% of charcoal, and 34% of nitre, the charcoal made from slightly charred straw or similar material. This "black charcoal" contains a considerable amount of the hydrogen and oxygen of the original plant substance. The proportion of charcoal in these explosives is so arranged that the black powder is the same as for black. They, however, differ from black by burning very slowly, even under considerable pressure. This comparative slowness is caused by (1) the presence of a small amount of charcoal, and (2) the lower amount of charcoal, is practically very slightly altered cellulose material, which before it can burn completely must undergo a little further resolution or charring at a temperature considerably higher than that required to bring about the change in black powder. The anode and cathode, and (3) the lower content of sulphur. An increase of a few per cent in the sulphur of black powder accelerates its rate of burning, and it may become almost a blasting powder. A decrease in sulphur has the reverse effect. It is really the sulphur vapour that in the early period of combustion spreads the flame through the charge.

Many other powders have been made or proposed in which nitrates or chlorates of the alkalies or of barium, &c., are the oxygen providers and substances as sugar, starch, and many other organic compounds as the combustible elements. Some of these compositions have found employment for blasting or even as sporting powders, but in most cases the black smoke and smokeless nitrocellulose explosives have displaced them, and they have not been used for military purposes. The adoption by the French government of the comparatively smokeless nitrocellulose explosive of Paul Vielle in 1847 practically put an end to black powder in France. In 1860, the manufacture of smokeless powder was made in 1865 by Colonel E. Schultz (Ding. Pol. Journ. 174, p. 322; 175, p. 433) by nitrating wood meal and adding potassium and sulphur. It is from this similar composition to that of the C.E. sporting powder. F. Uchatius, in Austria, proposed a smokeless powder made from nitrated starch, but it was not adopted owing to its hygroscopic nature and also its tendency to detonate.

GUNPOWDER PLOT, the name given to a conspiracy for blowing up King James I. and the parliament on the 13th of November 1605. To understand clearly the nature and origin of the famous conspiracy, it is necessary to recall the political situation and the attitude of the Roman Catholics towards the government at the accession of James I. The Elizabethan administration had successfully defended its own existence and the Protestant faith against able and powerful antagonists, but this had not been accomplished without enforcing severe measures of repression and punishment upon those of the opposite faith. The beginning of the chapter6, however, marks the very moment when the operatic influence of the new reign. The right of James to the crown could be more readily acknowledged by the Romanists than that of Elizabeth: Pope Clement VIII. appeared willing to meet the king half-way. James himself was by nature favourable to the Roman Catholics and had treated the Roman Catholic lords in Scotland with great leniency, in spite of their constant plots and rebellions. Writing to Cecil before his accession he maintained, "I am so far from any intention of persecution as I protest to God I reverence their church as our mother church, although clogged with many infirmities and corruptions, besides that I did ever hold persecution as one of the innumerable notes of a false church." He declared to Northumberland, the kinsman and master of Thomas Percy, the conspirator, "as for the Catholics, I will neither persecute any that will be quiet and give but an outward obedience to the law, neither will I spare to advance any of them that will be of good service and worthily deserved." It is probable that these small but practical concessions would have satisfied the lay Roman Catholics and the secular priests, but they were very far from contenting the Jesuits, by whom the results of such leniency were especially feared: What rigour of persecution would not compass in so many years," wrote Henry Thibborne, the Jesuit, in 1598, "this liberty and lenity will effectuate in 20 days, to wit the dismissing of the seminaries, the disannouncing of men to come and others to return, the expulsion of the society and confusion as in Germany, extinction of zeal and favour, disannimation of princes from the hot pursuit of the enterprise."

We shall be left as a prey to the wolves that will besides drive our greatest patron [the king of Spain] to stoop to a peace which will be the utter ruin of our edifice, this many years in building." Unfortunately, about this time the Jesuits, who thus thrived on political intrigue, and who were deeply implicated in treasonable correspondence with Spain, had obtained a complete ascendancy over the secular priests, who were for obeying the civil government as far as possible and keeping free from politics. The time, therefore, as far as the Roman Catholics themselves were concerned, was not a propitious one for introducing the moderate concessions which alone James had promised: James, too, on his side, found that religious toleration, though clearly sound in principle, was difficult in practice. During the first few months of the reign all went well. In July 1603 the fines for recusancy were remitted. In January 1604 peacable Roman Catholics could live unmolested and "serve God according to their consciences without any danger." But James's expectations that the pope would prevent dangerous and seditious persons from entering the country were unfulfilled and the numbers of the Jesuits and the Roman Catholics greatly increased. Rumours of plots came to hand. Cecil, though like his master naturally in favour of toleration, with his experience gained in the reign of Elizabeth, was alarmed at the policy pursued and its results, and great anxiety was felt to know the plot, in the first period of the shared by the king. It was determined finally to return to the earlier policy of repression. On the 22nd of February 1604 a proclamation was issued banning priests; on the 28th of November 1604, recusancy fines were demanded from 13 wealthy persons, and on the 10th of February 1605 the penal laws were ordered to be executed. The plot, however, could not have been occasioned by these measures, for it had been already conceived in the mind of Robert Catesby. It was aimed at the repeal of the whole Elizabethan legislation against the Roman Catholics and perhaps derived some impetus from the leniency lately shown by the administration, afterwards gaining support from the opposite cause, the return of the government to the policy of repression.

It was in May 1603 that Catesby told Percy, in reply to the latter's declaration of his intention to kill the king, that he was "thinking of a more sure way." Subsequently, about the 1st of November 1603, Catesby sent a message to his cousin Robert Winter at Huddington, near Worcester, to come to London, which the latter refused. On the arrival of a second urgent summons shortly afterwards he obeyed, and was then at a house at Lambeth, probably in January 1604, initiated by Catesby together with John Wright into the plot to blow up the parliament house. Before putting this plan into execution, however,
it was decided to try a "quiet way"; and Winter was sent over to Flanders to obtain the good offices of Juan de Velasco, duke of Frias and constable of Castle, who had arrived there to conduct the negotiations for a peace between England and Spain, in order to obtain the repeal of the penal laws. Winter, having secured nothing but vain promises from the constable, returned to England about the end of April, bringing with him Guy Fawkes, a devoted Roman Catholic, a base spirit, and fit leader for undertaking perilous adventures. Subsequently the three and Thomas Percy, who joined the conspiracy in May, met in a house behind St Clement's and, having taken an oath of secrecy together, heard Mass and received the sacrament in an adjoining apartment from a priest stated by Fawkes to have been Father Gerard. Later several other persons were included in the plot, viz. Winter's brother Thomas, John Grant, Ambrose Rosewood, Robert Keyes, Sir Everard Digby, Francis Tresham, a cousin of Catesby and Thomas Bates Catesby's servant, all, with the exception of the last, being men of good family and all Roman Catholics. Father Greenway and Father Garnet, the Jesuits, were both cognisant of the plot (see Garnet, Henry). On the 24th of May 1604 a house was hired in Percy's name adjoining the House of Lords, from the cellar of which they proposed to work a mine. They began on the 11th of December 1604, and by about March had got half-way through the wall. They then discovered that a vault immediately under the House of Lords was available. This was at once hired by Percy, and 36 barrels of gunpowder, amounting to about 1 ton and 12 cwt, were brought in and concealed under coal and faggots. The preparations being completed in May the conspirators separated. Fawkes was despatched to Flanders, where he imparted the plot to Hugh Owen, a zealous Romanist intriguer. Sir Edmund Baynham was sent on a mission to Rome to be at hand when the news came to gain over the pope to the cause of the successful conspirators. An understanding was arrived at with several officers levied for the service of the archduke, that they should return at once to England when occasion arose of defending the Roman Catholic cause. A great hunting match was organized at Danbury in Warwickshire by Digby, to which large numbers of the Roman Catholic gentry were invited, who were to join the plot after the successful accomplishment of the explosion of the 5th of November, the day fixed for the opening of parliament, and get possession of the princess Elizabeth, then residing in the neighbourhood; while Percy was to seize the infant prince Charles and bring him on horseback to their meeting-place. Guy Fawkes himself was to take ship immediately for Flanders, spread the news on the continent and get supporters. The conspirators impugned that a terrorized and helpless monarchy had no other means of overruling the government, and readily agreed to all their demands. Hitherto the secret had been well kept and the preparations had been completed with extraordinary success and without a single drawback; but a very serious difficulty now confronted the conspirators as the time for action arrived, and disturbed their consciences. The feelings of ordinary humanity shrank from the destruction of so many persons guiltless of any offence. But in addition, among the peers to be assassinated were included many Roman Catholics and some lords nearly connected in kinship or friendship with the plot. Several appeals were made to Catesby to allow warning to be given to certain individuals were firmly rejected. 

On the 26th of October Lord Montague, a brother-in-law of Francis Tresham, who had formerly been closely connected with some of the other conspirators and had engaged in Romanist plots against the government, but who had given his support to the new king, unexpectedly ordered supper to be prepared at his house at Haxton, from which he had been absent for more than a year. While at supper about 6 o'clock an anonymous letter was brought by an unknown messenger which, having glanced at, he handed to Ward, a gentleman of his service and an intimate friend of Winter, the conspirator, to be read aloud. The celebrated letter ran as follows:-

"My lord, out of the love I bear to some of your friends, I have a care for your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift of your attendance of this Parliament, for God and man hath concurred to punish the wicked. Believe me in this this is not strictly of this advertisement, but retire yourself into your kingdom, where you may expect the event in safety, for though there be no appearance of any stir, yet I say they shall find you terrible in the Parliament, and yet they shall not see who hurts them. This counsel is not to be contemned, because it may do you good and can do you no harm, for the danger is past as soon as you have burnt the letter: and I trust it ill give you the means to make good use of it, to whose holy protection I commend you."

The authorship of the letter has never been disclosed or proved, but all evidence seems to point to Tresham, and to the probability that he had some days before warned Montague and agreed with him as to the best means of making known the plot and preventing its execution, and at the same time of giving the conspirators time to escape (see Tresham, Francis). Montague at once started for Whitehall, found Salisbury and other ministers about to sit down to supper, and showed the letter, whereupon it was decided to search the cellars under the House of Lords before the meeting of parliament, but not too soon, so that the plot might be ripe and be fully disclosed. Meanwhile Ward, on the 27th of October, as had evidently been intended, informed Winter that the plot was known, and on the 28th Winter informed Catesby and begged him to give up the whole project. Catesby, however, after some hesitation, finding from Fawkes that nothing had been touched in the cellar, and prevailed upon by Percy, determined to stand firm, hoping that the government had put no coppers in Montague's letter. Fawkes returned to the cellar to keep guard as before. On the 4th the king, having been shown the letter, ordered the earl of Suffolk, as lord chamberlain, to examine the buildings. He was accompanied by Montague. On arriving at the cellar, the door was opened to him by Fawkes. Seeing the enormous piles of faggots he asked the name of their owner, to which Fawkes replied that they belonged to Percy. His name immediately aroused suspicions, and accordingly it was ordered that a further search should be made by Thomas Knyvet, a Westminster constable who, coming with his men at night, discovered the gunpowder and arrested Fawkes on the threshold.

The opinion that the whole plot was the work of Salisbury, that he acted as an agent provocateur and lured on his victims to destruction, repeated by some contemporary and later writers and recently formulated and urged with great ability, has no solid foundation. Nor is it even probable that he was aware of its existence till he received Montague's letter. Even after its reception complete belief was not placed in the warning. A search was made only to make sure that nothing was wrong and not only by Montague's letter, while no attempt was made to seize the conspirators. The steps taken by Salisbury before the discovery of the gunpowder do not show the possession of any information of the plot or of the persons who were its chief agents outside Fawkes's first statement, and his knowledge is seen to develop according to the successive disclosures and confessions of the latter. Thus on the 7th of November he had no knowledge of the mine, and it is only after Fawkes's examination by torture on the 9th, when the names of the conspirators were drawn from him, that the government was able to classify them according to their degrees of guilt and even to extend the official inquiry was not conducted by Salisbury alone, but by several coroners, some of whom were Roman Catholics, and many rivals and secret enemies. To conceal his intrigue from all these would have been impossible, and that he should have put himself in their power to such an extent is highly improbable. Again, the plan agreed upon for disclosing the plot was especially designed to allow the conspirators to escape, and therefore scarcely a method which would have been arranged with Salisbury. Not one of the conspirators, even when all hope of saving life was gone, made any accusation against Salisbury or the government and all expressed contrition for their crime. Lastly Salisbury had no conceivable motive in concocting a plot of this description. His political power and position in the new reign had been already secured and by very different methods. He was now at the height of his influence, having been created Viscount Cranborne.
in August 1604 and earl of Salisbury in May 1605; and James had already, more than 16 months before the discovery of the plot, consented to return to the repressive measures against the Romanists. The success with which the conspirators concealed their plot from Salisbury’s spies is indeed astonishing, but is probably explained by its very audacity and by the absence of incriminating correspondence, the medium through which the minister chiefly obtained his knowledge of the plans of his enemies.

On the arrest of Fawkes the other conspirators, except Tresham, fled in parties by different ways, joining the two others in Warwickshire, as had been agreed in case the plot had been successful. Catesby, who with some others had covered the distance of 80 miles between London and his mother’s house at Ashley St. Leighs in eight hours, informed his friends in Warwickshire, who had been awaiting the issue of the plot, of its failure, but succeeded in persuading Sir Everard Digby, from an unscrupulous falsehood, to further implicate himself in his hopeless case by assuring him that both James and Salisbury were dead; and, according to Father Garnet, this was not the first time that Catesby had dropped hints into his ears. He pushed on the same day with his companions in the direction of Wales, where, it was hoped, they would be joined by bands of insurgents. They arrived at Huddington at 2 in the afternoon. On the morning of the 7th the band, numbering about 36 persons, confessed and heard Mass, and then rode away to Holbeche, 2 miles from Stourbridge, in Staffordshire, the house of Stephen Littleton, who had been present at the hunting at Danchurch (see DIGBY, EVERARD), where they arrived at 10 o’clock at night, having on their way broken into Lord Windsor’s house at Hewell Grange and taken all the armour they found there. Their case was now desperate. None had joined them: “Not one came to take our part,” said Sir Everard Digby, “though we had expected so many.” They were being followed by the sheriff and all the forces of the county. All spurned them from their doors when they applied for succour. One by one their followers fled from the house in which the last scene was to be played out. They now began to feel themselves abandoned not only by man but by God; for an explosion of some of their gunpowder, on the morning of the 8th, by which Catesby and some others were scorched, struck terror into their hearts as a judgment from heaven. The assurance of innocence and of a just cause which till now had alone supported them was taken away. The greatness of their crime, its true nature, now struck home to them, and the few moments which remained to them of life were spent in prayer and in repentance. The supreme hour had now arrived. About 11 o’clock the sheriff and his men came up and immediately began firing into the house. Catesby, Percy and the two Wrights were killed, Winter and Rookwood wounded and taken prisoners with the men who still adhered to them. In all eight of the conspirators, including the two Winters, Digby, Fawkes, Rookwood, Keyes and Bates, were executed, while Tresham died in the Tower. Of the priests involved, Garnet was tried and executed, while Greenway and Gerard succeeded in escaping.

So ended the strange and famous Gunpowder Plot. However atrocious its conception and its aims, it is impossible not to feel, together with horror for the deed, some pity and admiration for the guilty persons who took part in it. “Theirs was a crime which it would never have entered into the heart of any man to commit who was not raised above the lowness of the ordinary criminal.” They sinned not against the light but in the dark. They erred from ignorance, from a perverted moral sense, rather than from any mean or selfish motive, and exhibited extraordinary courage and self-sacrifice in the pursuit of what seemed to them the cause of God and of their country. Their punishment was terrible. Not only had they risked and lost all in the attempt and drawn upon themselves the frightful vengeance of the state, but they saw themselves the means of injuring irretrievably the cause for which they felt such devotion. Nothing could have been more disastrous to the cause of the Roman Catholics than their crime. The laws against them were immediately increased in severity, and the gradual advance towards religious toleration was put back for centuries. In addition a new, increased and long-enduring hostility was aroused in the country against the adherents of the old faith, not unnaturally in the circumstances, but unjust and undiscriminating, because while some of the Jesuits were no doubt implicated, the secular priests and Roman Catholic laity as a whole had taken no part in the conspiracy.

BIBLIOGRAPHY.—The recent controversy concerning the nature and date of the plot has already been referred to. A Gunpowder Plot? by John Gerard, S.J. (1897); What Gunpowder Plot? by S. R. Gardiner (a rejoinder) (1897); The Gunpowder Plot... in reply to Professor Gardiner, by John Gerard, S. J. (1897); Thomas Winter’s Confession... by John Gerard, S. J. (1897, with facsimiles of his writing) (1868); Eng. Hist. Rev. iii. 310 and xii. 791; Edinburgh Review clxxv. 183; Athenaeum 1891, 4th, 1895, 255; 1896, i. 23, ii. 352, 420; Academy, vol. 52 p. 84; The Nation, vol. 44, 1886, p. 218. Other controversy centres round the question of the authenticity of Thomas Winter’s confession, the MS. of which is at Hatfield, supported by Professor Gardiner, but denied by Father Gerard principally on account of the document having been signed “Winter” instead of “Wintour,” the latter apparently being the conspirator’s usual style of signature. The document was deposited by the 3rd Marquess of Salisbury for inspection at the Record Office, and was pronounced by two experts, one from the British Museum and another from the Record Office, to be undoubtedly genuine. The cause of the controversy is the plain following explanation: the bibliography of the contemporary controversy is given in the article on Henry Garnet in the Dictionary of National Biography and in The Gunpowder Plot ed. by Leonard Waugh (1892), remaining the principal authority on the subject; add to these Gardiner’s Hist. of England, i., where an excellent account is given; History of the English Catholics, by Father Ethelred Taunton (1901); Father Gerard’s Narrative in Condition of the Catholic; and Winter James I. (1872), and Father Greenway’s Narrative in Troubles of our Catholic Forefathers, 1st series (1872), interesting as contemporary accounts, but not to be taken as complete or infallible authorities, of the same nature being Historia Provinciarum Angliae Societatis Jesu, by Henry More, S.J. (1660), pp. 309 et seq.; also History of Great Britain, by John Speed (1611), pp. 539 et seq.; Archivo, 157, xii. 207, 209; Hallock’s Catholic Life (1890), iii. 119-135, or Somers Tracts (1809), ii. 97-117; M. A. Tierney’s ed. of Dodd’s Church History, vol. iv. (1841); Treason and Plot, by Martin Hume (1801); Collections and Queries, 7 ser. vi. 8 ser. iv. 408, 497, v. 55, xii. 195, 9 ser. vi. 118; Brit. Mus. 6178; State Trials, ii.; Calendar of State Pap. Dom. (1603-1610), and the official account, A True and Perfect Relation of the Whole Proceedings against the late most Barbarous Traitors (1660), a neither true nor complete narrative however, now superseded as an authority, reprinted as The Gunpowder Treasure, with additional matter by Thomas Barkow, bishop of Lincoln. A large number of letters and other State Papers and correspondence, of which the plot were collected in one volume in 1819, called the Gunpowder Plot Book; these are noted in their proper place in the printed volumes of State Papers, and are in the British Museum; other State Papers, for instance, Fawkw, Guy; Tresham, Francis; Montagle, William Parker, 4th Baron; Percy, Thomas; Catesby, Robert; Garnet, Henry; Digby, Sir Everard. (P. C. Y.)

GUN-ROOM, a ship cabin occupied by the officers below the rank of lieutenant, but who are not warrant officers of the class of the bosun, gunner or carpenter. In the wooden sailing ships it was on the lower deck, and was originally the quarters of the gunner.

GUNTER, EDMUND (1581-1626), English mathematician, of Welsh extraction, was born in Hertfordshire in 1581. He was educated at Westminster school, and in 1599 was elected a student of Christ Church, Oxford. He took orders, became a preacher in 1614, and in 1615 proceeded to the degree of bachelor of divinity. Mathematics, however, which had been his favourite study in youth, continued to engross his attention, and on the 6th of March 1616 he was appointed professor of astronomy in Emmanuel College, Lincoln’s Inn Fields, at the age of only 35, on the 10th of December 1626. With Gunter’s name are associated several useful inventions, descriptions of which are given in his treatises on the Sector, Cross-staff, Bow, Quadrant and other Instruments. He contrived his sector about the year 1606, and wrote a description of it in Latin, but it was more than sixteen years afterwards before he allowed the book to appear in English. In 1620 he published his Canon triangulorum (see LOGARITHMS). There is reason to believe that Gunter was the first to discover (in 1622 or 1623) that the magnetic needle does not retain the same declination in the same place at all times. By desire of
James I. he published in 1624 The Description and Use of His Majestie's Dials in Whitehall Garden, the only one of his works which has not been reprinted. He introduced the words cosine and cotangent, and he suggested to Henry Briggs, his friend and colleague, the use of the arithmetical complement (see Briggs's *Arithmetica Logarithmica*, cap. xv.). His practical inventions are briefly noticed below:

**Günther's Chain**, the chain in common use for surveying, is 22 yards long and is divided into 1000 links. It is also called the line of length and the line of measure. It is only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically.

**Günther's Quadrant**, an instrument made of wood, brass or other substance, containing a kind of stereographic projection of the sphere on the plane of the equinoctial, the eye being supposed to be placed in one of the poles, so that the tropic, ecliptic, and horizon form the arcs of circles, while the hour circles are other curves, drawn by means of several latitudes of the sun for some particular latitude every year. This instrument is used to find the hour of the day, the time of observation, and other conditions of the sphere or globe, and also to take the altitude of an object in degrees.

**Günther's Scale** (generally called by seamen the *Günther*) is a large planimeter useful in finding the area of a ship, and between 150 and 200 by 1700, with various lines of numbers. On one side are placed the natural lines (as the line of chords, the line of sines, tangents, rhumbs, &c.), and on the other side the corresponding artificial or logarithmic ones. Problems on the surface of the globe, trigonometry, &c., are solved with the aid of a pair of compasses.

**Günther, Johann Christian** (1695-1723), German poet, was born at Striegau in Lower Silesia on the 8th of April 1695. After attending the gymnasium at Schweidnitz, he was sent in 1715 by his father, a country doctor, to study medicine at Wittenberg; but he was idle and dissipated, had no taste for the profession chosen for him, and came to a complete rupture with his family. In 1717 he went to Leipzig, where he befriended by J. B. Mencke (1674-1732), who recognized his genius; and there he published a poem on the peace of Passarowitz (concluded between the German emperor and the Porte in 1718) which acquired him a reputation. A recommendation from Mencke to Frederick Augustus II. of Saxony, king of Poland, proved worse than useless, as Günther appeared at the audience drunk. From that time he led an unsettled and dissipated life, sinking ever deeper into the slough of misery, until he died at Jena on the 15th of March 1723, when only in his 28th year. Goethe pronounces Günther to have been a poet in the fullest sense of the term. His lyric poems as a whole give evidence of deep and lively sensibility, fine imagination, clever wit, and a true ear for music; and his sonnets are instances of his air correctness in many of his poems was observed by his own pupils, and many of his verses were reprinted.

Günther's collected poems were published in four volumes (Breslau, 1723-1732). They are also included in vol. vi. of Tittmann's *Deutsche Dichter des 17ten Jahrh.* (Leipzig, 1874), and vol. xxxviii. of Kürschner's *Deutsche Nationalliteratur* (1883). A pretended autobiography of Günther appeared at Schweidnitz in 1732, and a life of him by Siebrand at Leipzig in 1738. See Hoffmann von Fallersleben, *J. Ch. Günther* (Breslau, 1833); O. Roquette, *Leben und Dichten J. Ch. Günthers* (Breslau, 1860); M. Kalbeck, *Neue Beiträge zur Biographie des Dichters C. Günther* (Breslau, 1879).

**Günther of Schwazburg** (1304-1340), German king, was a descendant of the counts of Schwazburg and the younger son of Henry VII., count of Blankenburg. He distinguished himself as a soldier, and rendered good service to the emperor Louis IV., on whose death in 1347 he was offered the German throne, after it had been refused by Edward III., king of England. He was elected German king at Frankfort on the 30th of January 1349 by four of the electors, who were partisans of the house of Wittelsbach and opponents of Charles of Luxembourg, afterwards the emperor Charles IV. Charles, however, won over many of Günther's adherents, defeated him at Eltville, and Günther, who was now seriously ill, renounced his claims for the sum of 20,000 marks of silver. He died three weeks afterwards at Frankfort, and was buried in the cathedral of that city, where a statue was erected to his memory in 1352.

**Guntam, or Gonntran** (561-592), king of Burgundy, was one of the sons of Clotaire I. On the death of his father (561) he and his three brothers divided the Frankish realm between them, Guntram receiving as his share the counties of the Rhine and Rhone, together with Berry and the town of Orleans, which he made his capital. On the death of Charibert (567), he further obtained the *civitates* of Saints, Angoulême and Périgueux. During the civil war which broke out between the kings of Neustria and Austrasia, his policy was to try to maintain a state of equilibrium. After the assassination of Sigebert (575), he took the youthful Childerich II. under his protection, and, thanks to his assistance against the intrigues of the great lords, the latter was able to maintain his position in Austrasia. After the death of Childeper (584) he protected the young Clovis II. in the same way, and prevented Childebert from seizing his dominions. His course was rendered easier by the fact that his own sons had died; consequently, having an inheritance at his disposal, he was able to offer it to whichever of his nephews he wished. The danger to the Frankish realm caused by the expedition of Gundobald (585), and the anxiety which was caused him by the revolts of the great lords in Austrasia finally decided him in favour of Childerich. He adopted him as his son, and recognised him as his heir. The treaty of Andecourt (589); he also helped him to crush the great lords, especially Urric and Berthefrid, who were conquered in la Woëvre. From this time on he ceased to play a prominent part in the affairs of Austrasia. He died in 592, and Childebert received his inheritance without opposition. Gregory of Tours is very indulgent to Guntram, who showed himself on occasions generous towards the church; he almost always calls him "good king Guntram," and in his writings are to be found such phrases as "good king Guntram took as his servant a counsellor Veneranda" (iv. 23); but Guntram was really no better than the other kings of his age; he was cruel and licentious, putting his *cubiculierius* Condo to death, for instance, because he was suspected of having killed a bufalo in the Vosges. He was moreover coward, and went in such constant terror of assassination that he always surrounded himself with a regular bodyguard.

**Gunthar,** a town and district of British India, in the Madras presidencies. The town (pop. in 1901, 30,535) has a station on the Bellary-Byavada branch of the South Indian Railway. It is situated east of the Kondavid hills, and is very healthy. It appears to have been founded in the 18th century by the French. At the time of the cession of the Circars to the English in 1765, Gunthar was specially exempted during the life of Basalat Jang, whose personal jagir it was. In 1788 it came into British possession, the cession being finally confirmed in 1834. It has an important trade in cotton, with presses and ginning factories. There is a second-grade college supported by the American Mission. Until 1859, Gunthar was the headquarters of the district of the same name, and in 1859 a new District of Gunthar was constituted, covering territory which till then had been divided between Kistsna and Nellore. Area, 5733 sq. m. The population on this area in 1901 was 1,490,635. The district is bounded on the E. and N. by the river Kistsna; in the W. a considerable part of the boundary is formed by the Gundlakamma river. The greater part consists of a fertile plain irrigated by canals from the Kistsna, and producing cotton, rice and other crops.

**Gupta,** an empire and dynasty of northern India, which lasted from about A.D. 320 to 480. The dynasty was founded by Chandragupta I., who must not be confounded with his famous predecessor Chandragupta Maurya. He gave his name to the Gupta era, which continued in use for several centuries, dating
GURDA—GURKHA

from the 26th of February, A.D. 320. Chandragupta was succeeded by Samudragupta (c. A.D. 326-375), one of the greatest of Indian kings, who conquered nearly the whole of India, and whose alliances extended from the Oxus to Ceylon; but his name was at one time entirely lost to history, and has only been recovered of recent years from coins and inscriptions. His empire rivalled that of Asoka, extending from the Helo to the east of the Jumna and Chambal on the west, and from the foot of the Himalayas on the north to the Nerbudda on the south. His son Chandragupta II. (c. A.D. 375-413) was also known as Vikrāmāditya (γ.τ.), and seems to have been the original holder of the name. About 378 he conquered the Sakā headquarits of Sasrāsha (Kathīwar) and penetrated to the Arabian Sea. His administration is described in the work of Fa-hien, the earliest Chinese pilgrim, who visited India in A.D. 405-411. Pataliputra was the capital of the dynasty, but Ajodhya seems to have been sometimes used by both Samudragupta and Chandragupta II. as the headquarters of government. The Gupta dynasty appears to have fostered a revival of Brahmanism at the expense of Buddhism, and to have given an impetus to art and literature. The famous Kālāśāla branch of the mathematical Hindu Brahmans of that name, flourished under the patronage of the Guptas. The famous Lieder of the Middle Ages, however, were composed at the court of the Guptas in the 4th century.

GURA, EUGEN (1842-1906), German singer, was born near Saat in Bohemia, and educated at first for the career of a painter at Vienna and Munich; but later, developing a fine baritone voice, he took up singing and studied it at the Munich Conservatorium. In 1865 he made his début at the Munich opera, and in the following years he gained the highest reputation in Germany, being engaged principally at Leipzig till 1876 and then at Hamburg till 1883. He sang in 1876 in the Ring at Bayreuth, and was famous for his Wagnerian rôles; and his Hans Sachs in Meister-singer, as performed in London in 1882, was magnificent. In later years he showed the perfection of art in his music of German Lieder.

He died in Bavaria on the 26th of August 1906.

GURDASPUR, a town and district of British India, in the Lahore division of the Punjab. The town had a population in 1901 of 5764. It has a fort (now containing a Brahman monastery) which was famous for the siege it sustained in 1712 from the Moguls. The Sikh leader, Banda, was only reduced by starvation, when he and his men were tortured to death after capitulating. The district comprises an area of 1898 sq. m. It is bounded on the N. by the native states of Kashmir and Chamba, on the E. by Kangra district and the river Beas, on the S.W. by Amritsar district, and on the W. by Sialkot, and occupies the submontane portion of the Dari Doab, or tract between the Beas and the Ravi. An intrusive spur of the British dominions runs northward into the lower Himalayan ranges, to include the mountain sanatorium of Dalhousie, 7687 ft. above sea-level. This station, which has a large fluctuating population during the warmer months, crowns the most westerly shoulder of a magnificent snow-covered range, the Dalhodlahar, between which and the plain two minor ranges intervene. Below the hills stretches a picturesque and undulating plateau covered with abundant timber, made green by a copious rainfall, and watered by the streams of the Dari Doab, which, diverted by dams and embankments, now empty their waters into the Beas directly, in order that their channels may not interfere with the Dari Doab canal. The district contains several large jhils or swampy lakes, and is famous for its snipe-shooting. It is historically important in connexion with the rise of the Sikh confederacy. The whole of the Punjab was then distributed among the Sikh chiefs who triumphed over the imperial governors. In the course of a few years, however, the Harimurth Singh acquired all the territory which those chiefs had held. Pathankot and the neighbouring villages in the plain, together with the whole hill portion of the district, formed part of the area ceded by the Sikhs to the British after the first Sikh war in 1846. In 1862, after receiving one or two additions, the district was brought into its present shape. In 1901 the population was 940,334, showing a slight decrease, compared with an increase of 15% in the previous decade. A branch of the North-Western railway runs through the district. The largest town and chief commercial centre is Balta. There are important woolen mills at Dharlwal, and besides their products the district exports cotton, sugar. grain and oil-seeds.

GURGAON, a town and district of British India, in the Delhi division of the Punjab. The town (pop. in 1901, 4762) is the headquarters of the district, but is otherwise unimportant. The district has an area of 1854 sq. m. It is bounded on the N. by Rohtak, on the W. and S.W. by portions of the Alwar, Nàbha and Jind native states, on the E. by the Muttra district of the United Provinces, on the E. by the river Jumna and on the N.E. by Delhi. It comprises the southernmost corner of the Punjab province, stretching away from the level plain towards the hills of Rajputana. Two low rocky ranges enter its borders from the south and run northward in a bare and unshaded mass toward the plain country. East of the western ridge the valley is wide and open, extending to the banks of the Jumna. To the west lies the subdivision of Rewari, consisting of a sandy plain dotted with isolated hills. Numerous torrents carry off the drainage from the upland ranges, and the most important among them empty themselves at last into the Najagarh jhil. This swampy lake lies to the east of the civil station of Gurgaon, and stretches long arms into the neighbouring districts of Delhi and Rohtak. Salt is manufactured in wells at several villages. The mineral products are iron ore, copper ore, plumago and ochre.

In 1863 Gurgaon district passed into the hands of the British after Lord Lake's conquests. On the outbreak of the Mutiny in May 1857, the nawab of Farukhnagar, the principal feudatory of the district, rose in rebellion. The Meos and many Rajput families followed his example. A faithful native officer preserved the public buildings and records at Rewari from destruction but, with this exception, British authority became extinguished for a time throughout Gurgaon. After the fall of the rebel capital, a force marched into the district and either captured or dispersed the leaders of rebellion. The territory of the nawab was confiscated on account of his participation in the Mutiny. Civil administration was resumed under orders from the Punjab government, to which province the district was formally annexed on the final pacification of the country. The population in 1901 was 240,208, showing an increase of 11% in the decade. The largest town and chief trade centre is Rewari. The district is traversed by several lines of railway, and irrigation is provided by the Agra canal. The chief trade is in cereals, but hardware is also exported.

GURKHA (pronounced gorkha; from Sans. gān, 'a cow, and raks, 'to protect'), the ruling Hindu race in Nepal (q.v.). The Gurkhas, or Gorkhalis, claim descent from the rajahs of Chitor in Rajputana. When driven out of their own country by the Mahomedan invasion, they took refuge in the hill districts about Kumaon, whence they gradually invaded the country to the eastward as far as Chamba. Noakhote and ultimately to the valley of Nepal and even Siklim. They were stopped by the English in an attempt to push south, and the treaty of Segauli,
which ended the Gurkha War of 1814, definitely limited their territorial growth. The Gurkhas of the present day remain Hindus by religion, but show in their appearance a strong admixture of Mongolian blood. They make splendid infantry soldiers, and by agreement with their government about 20,000 have been recruited for the Gurkha regiments of the Indian army. As a rule they are bold, enduring, faithful, frank, independent and self-reliant. They despise other Orientals, but admire and Fraternize with Europeans, whose tastes in sport and war they share. They strongly resemble the Japanese, but are of a sturdier build. Their national weapon is the kuki, a heavy curved knife, which they use for every possible purpose.

See Capt. Elin Vansittart, Notes on the Gurkhas (1898); and P. D. Bonarjee, The Fighting Races of India (1896).

GURNALL, WILLIAM (1617-1679), English author, was born in 1617 at King's Lynn, Norfolk. He was educated at the free grammar school of his native town, and in 1631 was nominated to the Lynn scholarship in Emmanuel College, Cambridge, where he graduated B.A. in 1635 and M.A. in 1639. He was made rector of Lavenham in Suffolk in 1644; and before he received that appointment he seems to have officiated, perhaps as curate, at Sudbury. At the Restoration he signed the declaration required by the Act of Uniformity, and on this account he was the subject of a libellous attack, published in 1663, entitled Covenant- Renouncers Desperate Apostates. He died on the 12th of October 1679. Gurnall is known by his Christain in Complete Armour, published in three volumes, dated 1655, 1658 and 1662. It consists of a series of sermons on the latter portion of the 6th chapter of Ephesians, and is described as "a magazine from whence the Christian is furnished with spiritual arms for the battle, helped on with his armour, and taught the use of his weapon; together with the happy issue of the whole war." The work is more practical than theological; and its quaint fancy, graphic and pointed style, and its fervent religious tone render it still popular with some readers.

See also An Inquiry into the Life of the Rev. W. Gurnall, by H. M'Keon (1830), and a biographical introduction by Bishop Ryie to the Christian in Complete Armour (1865).

GURNARD (Trigla), a genus of fishes forming a group of the family of "mailed cheeks" (Trigiidae), and easily recognized by three detached finger-like appendages in front of the pectoral fins, and by their large, angular, bony head, the sides of which are protected by strong, hard, and rough bones. The pectoral appendages are provided with strong nerves, and serve not only as organs of locomotion when the fish moves on the bottom, but also as organs of touch, by which it detects small animals on which it feeds. Gurnards are coast-fishes, generally distributed over the tropical and temperate areas; of the forty species known six occur on the coast of Great Britain, viz. the red gurnard (T. pinni), the streaked gurnard (T. lineata), the sapphire gurnard (T. hirundo), the grey gurnard (T. gurnardus), the piper (T. lyra) and the long-finned gurnard (T. obscura or T. lucerna). Although never found very far from the coast, gurnards descend to depths of several hundred fathoms; and as they are bottom-fish they are caught chiefly by means of the trawl. Not rarely, however, they may be seen floating on the surface of the water, with their broad, finely coloured pectoral fins spread out like fans. In very young fishes, which abound in certain localities on the coast in the months of August and September, the pectorals are comparatively much longer than in the adult, extending to the end of the body; they are beautifully coloured and kept expanded, the little fishes looking like butterflies. When caught and taken out of the water, gurnards emit a grunting noise, which is produced by the vibrations of a diaphragm situated transversely across the cavity of the bladder and perforated in the centre. This grunting noise gave rise to the name "gur- nard," which is probably an adaptation or variation of the Fr. grenier, grumbler, cf. the Fr. grondin, gurnard, from gronder, and Ger. Knurrfisch. Their flesh is very white, firm and wholesome.

GURNEY, the name of a philanthropic English family of bankers and merchants, direct descendants of Hugh de Gournay, lord of Gournay, one of the Normand noblemen who accompanied William the Conqueror to England. Large grants of land were made to Hugh de Gournay in Norfolk and Suffolk, and Norwich has since that time been the headquarters of the family, the majority of whom were Quakers. Here in 1770 the brothers John and Henry Gurney founded a banking-house, the business passing in 1779 to Henry's son, Bartlett Gurney. On the death of Bartlett Gurney in 1813, the bank became in the hands of John, of whom John Gurney (1759-1809) was the most remarkable. One of his daughters was Elizabeth Fry; another married Sir Thomas Powell Buxton. Of his sons one was Joseph Gurney (1788-1847), a well-known philanthropist of the day; another, Samuel Gurney (1786-1856) assumed on his father's death the control of the Norwich bank. Samuel Gurney also took over about the same time the control of the London bill-broking business of Richardson, Overend, & Company, in which he was already a partner. This business had been founded in 1806 by Thomas Richardson, clerk to a London bill-discounter, and John Overend, chief clerk in the bank of Smith, Payne & Company at Nottingham, the Gurneys supplying the capital. At that time bill-discounting was carried on in a spasmodic fashion by the ordinary merchant in addition to his regular business, but Richardson considered that there was room for a London house which should devote itself entirely to the trade in bills. This, at that time, novel idea proved an instant success. The title of the firm was subsequently changed to Overend, Gurney & Company, and for forty years it was the greatest discounting-house in the world. During the financial crisis of 1847, Overend, Gurney & Company were able to make short loans to many other bankers. The house indeed became known as "the bankers' banker," and secured many of the previous clients of the Bank of England. Samuel Gurney died in 1856. He was a man of very charitable disposition, and during the latter years of his life charitable and philanthropic undertakings almost monopolized his attention. In 1865 the business of Overend, Gurney & Company, which had come under less competent control, was converted into a joint stock company, but in 1866 the firm suspended payment with liabilities amounting to eleven millions sterling.

GURNEY, EDMUND (1847-1888), English psychologist, was born at Hershaw, near Walton-on-Thames, on the 23rd of March 1847. He was educated at Blackheath and at Trinity College, Cambridge, where he took a high place in the classical triposes and obtained a fellowship. His work for the schools was done, says his friend F. W. H. Myers, "in the intervals of his practice on the piano." Dissatisfied with his own executive skill as a musician, he wrote The Power of Sound (1880), an essay on the philosophy of music. He then studied medicine with no intention of practising, but devoted himself to physiology, chemistry and physiology. In 1880 he passed the second M.B. Cambridge examination in the science of the healing profession. These studies, and his great logical powers and patience in the investigation of evidence, he devoted to that outlying field of psychology which is called "Psychical Research." He asked whether, as universal tradition declares, there is an unexplored region of human faculty transcending the normal limitations of sensible knowledge. That there is such a region it was part of the system of Hegel, Berkeley, and the subject had been metaphysically treated by Hartmann, Schopenhauer, Du Frei, Hamilton and others, as the philosophy.
GURWOOD—GUSTAVUS I. ERIKSSON

733

of the Unconscious or Subconscious. But Gurney’s purpose was to approach the subject by observation and experiment, especially in the hypnotic field, whereas vague and ill-attested anecdotes which had been his subject matter would have been a waste of time.

The tendency of his mind was to investigate whatever facts may give a colour to the ancient belief in the persistence of the conscious human personality after the death of the body. Like Joseph Glanvill’s, the natural bent of Gurney’s mind was sceptical. Both thought the current and traditional reports of supernormal occurrences suggestive and worth investigating by the ordinary methods of scientific observation, and inquisition into evidence at first hand. But the method of Gurney was, of course, much more strict than that of the author of Saggiocismus Triumphatus, and it included hypnotic and other experiments unknown to Glanvill. Gurney began at what he later saw was the wrong end by studying, with Myers, the “seances” of professes spiritualistic mediums.

Such experiments, as far as possible, were repeated by others, and the results were examined by both Gurney and Myers in a collection (Podmore, Myers and Gurney), and in Gurney’s remarkable essay, Hallucinations. The chief consequence was to furnish evidence for the process called “telepathy,” involving the provisional hypothesis that one human mind can affect another through no recognized channel of sense. The fact was supposed to be established by the experiments chronicled in the Proceedings of the Society for Psychical Research, and it was argued that similar experiences occurred spontaneously, as, for example, in the many recorded instances of “deathbed wraths” among civilized and savage races. (Tylor, Primitifte Culture, i. chaps. 21, 22, 34, 43, 1874; Gerald Massey, Religion, pp. 120-124, 1898.) The dying man is supposed to convey the hallucination of his presence as one living person experimentally conveys his thought to another, by “thought transference.” Gurney’s hypnotic experiments, marked by great exactness, patience and ingenuity, were undertaken in 1857-1888. Their tendency was, in Myers’s words, “to prove—so far as any one operator’s experience in this protein subject can be held to prove anything—that there is sometimes, in the induction of hypnotic phenomena, some agency at work which is not, or can not be, animal nervous or psychic, but (as sudden) nor suggestion conveyed by any ordinary channel to the subject’s mind.” These results, if accepted, of course corroborate the idea of telepathy. (See Gurney, “Hypnotism and Telepathy,” Proceedings S.P.R. vol. iv.) Experiments by MM. Gibert, Janet, Richet, Héricourt and others are cited as tending in the same direction. Other experiments dealt with “the relation of the memory in the hypnotic state to the memory in another hypnotic state, and of both to the normal or waking memory.” The result of Gurney’s labours, cut short by his early death, was to raise and strengthen the presumption that there exists an unexplored region of human faculty which ought not to be neglected by science as if the belief in it were a mere survival of savages superstition. Rather, it appears to have furnished the experiences which, misinterpreted, are expressed in traditional beliefs. That Gurney was cedulous and easily imposed upon those who knew him, and knew his penetrating humour, cannot admit; nor is the theory likely to be maintained by those whom bias does not prevent from studying with care his writings. In controversy he delighted in replying with easy courtesy to attacks exchanged in the pages of the London Times. His character is akin to a ghost or the human soul seems to have been adopted in various philoso-phers to inspire.” In discussion of themes unpopular and obscure Gurney displayed the highest tact, patience, good temper, humour and acuteness. There never was a more disinterested student. In addition to his work on music and his psychological writings, he was the author of Tertium Quid (1857), a collection of essays, on the whole a protest against one-sided ideas and methods of discussion. He died at Brighton on 23rd June 1888, from the effects of an overdose of narcotic medicine.

GURWOOD, JOHN (1700-1845), British soldier, born in 1845 in his career in a merchant’s office, but soon obtained an ensigncy in the 2nd (1808). With his regiment he served in the “Light Division” of Wellington’s army throughout the earlier Peni-sular campaign, and at Ciudad Rodrigo (10th Jan. 1812) he led one of the forlorn hopes and was severely wounded. For his gallant conduct on this occasion Wellington presented Gurwood with the sword of the French governor of Ciudad Rodrigo. A little later, transferring to the 9th Light Dragoons, he was made brigade-major to the Guards’ cavalry which had just arrived in Ireland. In 1809 he was a brevet-colonel. To this work is a monument of industrious skill, and earned it’s author a Civil List Pension of £200. But overwork and the effects of his wounds had broken his health, and he committed suicide on Christmas day 1845.

GUSLA, or GUSEL, an ancient stringed instrument still in use among the Slavonic races. The modern Servian gusla is a kind of tambur (see Pandura), consisting of a round, concave body covered with a parchment soundboard; there is but one horse-hair string, and the peg for tuning it is inserted in oriental fashion in the back of the head. The gusla is played with a primitive bow. The gusle of the Serbs, Croats and Servia and Croatia use it to accompany their chants. C. G. Anton1 mentions an instrument of that name in the shape of a half-moon strung with eighteen strings in use among the Tatars. Prosper Merimeé2 has taken the gusla as the title for a book of Servian poems, which are supposed to have been collected by him among the peasants, but which are thought to have been inspired by the Viaggio in Dalmazia of Alberto Fortis.

Among the Russians, the gusli is an instrument of a different type, a kind of psaltery having five or more strings stretched across a flat, shallow sound-chest in the shape of a wing. In the gusli the strings, of graduated length, are attached to little nails or pins at one end, and at the other they are wound over a rod having screw attachments for increasing and slackening the tension. There is no bridge to determine the vibrating length of the strings. The body of the instrument is shaped roughly like the tail of the grand piano, following the line of the strings; the longest being at the left of the instrument. Matthew Guthrie gives an illustration of the gusli.3

GUSTAVUS I. ERIKSSON (1456-1560), king of Sweden, was born at his mother’s estate at Lindholm on Ascension Day 1456. He came of a family which had shone conspicuously in 14th-century politics, though it generally took the anti-national side. His father, Erik Johansson of Rydboholm, “a merry and jocose gentleman,” but, like all the Swedish Vasaas, liable to sudden fierce tempers, was one of the Senators who voted for the deposition of Archbishop Trolle, at the riksdag of 1517 (see Sweden, History), for which act of patriotism he lost his head. Gustavus’s mother, Cecilia Månssäter, was closely connected by marriage with the great Sture family. Gustavus’s youthful experiences impressed him with a life-long distrust of everything Danish. In his eighteenth year he was sent to the court of his cousin Sten Sture. At the battle of Brännkyrka, when Sture

defeated Christian II. of Denmark, the young Gustavus bore the governor's standard, and in the same year (1518) he was delivered with five other noble youths as a hostage to King Christian, who treacherously carried him prisoner to Denmark. He was detained for twelve months in the island fortress of Kalø, on the east coast of Jutland, but contrived to escape to Lübeck in September 1519. There he found an asylum till the 20th of May 1520, when hechartered a ship to Kalmar, one of the few Swedish fortresses which held out against Christian II.

It was while hunting near Lake Mälaren that the news of the Stockholm massacre reached him. It was brought to him by a peasant fresh from the capital, who told him, at the same time, that a price had been set upon his head. In his extremity, Gustavus saw only one way of deliverance, an appeal for help to the sturdy yeomen of the dales. How the dalesmen set Gustavus on the throne and how he and they finally drove the Danes out of Sweden (1521-1523) is elsewhere recorded (see Sweden: History). But his worst troubles only began after his coronation on the 6th of June 1523.

The financial position of the crown was the most important of all the problems demanding solution, for upon that everything else depended. By releasing his country from the tyranny of the crown, Gustavus had made the free independent development of Sweden a possibility. It was for him to realize that possibility. First of all, order had to be evolved from the chaos in which Sweden had been plunged by the disruption of the Union; and the shortest, perhaps the only, way thereto was to restore the royal authority, which had been in abeyance during ninety years. But an effective reforming monarchy must stand upon a sound financial basis; and the usual revenues of the crown, always inadequate, were so diminished that they did not cover even the daily expenses of government. New taxes could only be imposed with extreme caution, while the country was still bleeding from the wounds of a long war. And men were wanted even more than money. The lack of capable, trustworthy administrators in Sweden was grievous. The whole burden of government weighed exclusively on the shoulders of the new king, a young man of seven and twenty. Half his time was taken up in travelling from one end of the kingdom to the other, and doing purely clerical work for want of competent assistance. We can form some idea of his difficulties when we learn that, in 1533, he could not send an ambassador to Lübeck because not a single man in his council, except himself, knew German. It was this lack of native talent which compelled Gustavus frequently to employ the services of foreign adventurers like Berent von Mehlen, John von Hoja, Konrad von Pyhy and others.

It was not the least of Gustavus's many anxieties that he had constantly to be on the watch lest a formidable democratic rival should encroach on his prerogative. That rival was the Swedish peasantry. He succeeded in putting down the four formidable rebellions which convulsed the realm from 1525 to 1542, but the consequent strain upon his resources was very damaging, and more than once he was on the point of abdicating and emigrating, out of sheer weariness. Moreover he was in constant fear of the Danes. Necessity compelled him indeed (1534-1536) to take part in Grevns feje (Counts' War) (see Denmark, History), as the ally of Christian III., but his exaggerated distrust of the Danes was invincible. "We advise and exhort you," he wrote to the governor of Kalmar, "to put no hope or trust in the Danes, or in their sweet scribbling, inasmuch as they mean nothing at all by it except how best they may deceive and betray us Swedes." Such instructions were not calculated to promote confidence between Swedish and Danish negotiators. A fresh cause of dispute was generated in 1548, when Christian III.'s daughter was wedded to Duke Augustus of Saxony. On that occasion, apparently by way of protest against the decree of the diet of Vesterås (15th of January 1544), declaring the Swedish crown hereditary in Gustavus's family, the Danish king caused to be quartered on his daughter's shield not only the three Imperial lions and the Norwegian lion with the axe of St Olaf, but also the three crowns of Gustavus, which was much perturbed by the innovation, and warned all his border officials to be watchful and prepare for the worst.

In 1557 he even wrote to the Danish king protesting against the placing of "the three crowns" in the royal Danish seal beneath the arms of Denmark. Christian III. replied that "the three crowns" signified not Sweden in especial, but the three Scandinavian kingdoms, and that their insertion in the Danish shield was only a reminiscence of the union of Kalmar. But Gustavus was not satisfied, and this was the beginning of "the three crowns" dispute which did so much damage to both kingdoms.

The events which led to the rupture of Gustavus with the Holy See he was forth in these very places (see Sweden: History). Here it need only be added that it was a very political thing, as Gustavus, personally, had no strong dogmatic leanings either way. He did not unnaturally express his amazement when that very juvenile reformer Olavus Petri confidently informed him that the pope was antichrist. He consulted the older and graver Laurentius Andreas, who told him how "Doctor Martinus had clipped the wings of the pope, the cardinals and the big bishops," which could not fail to be pleasing intelligence to a monarch who was never an admirer of episcopacy, while the rich revenues of the church, accumulated in the course of centuries, were a tempting object to the impecunious ruler of an impoverished people. Subsequently, when the Protestant hierarchy was forcibly established in Sweden, matters were much complicated by the absolutist tendencies of Gustavus. The incessant labour, the constant anxiety, which were the daily portion of Gustavus Vasa during the seven and thirty years of his reign, told at last even upon his magnificent constitution. In the spring of 1560, conscious of an ominous decline of his powers, Gustavus summoned his last diet, to give an account of his stewardship. On the 10th of June 1560 the assembly met at Stockholm. Ten days later, supported by his sons, Gustavus greeted the estates in the great hall of the palace, when he took a retrospect of his reign, reminding them of the misery of the kingdom during the union and its deliverance from "that unkind tyrant, King Christian." Four days later the diet passed a resolution confirming the hereditary right of Gustavus's son, Prince Eric, to the throne. The old king's last anxieties were now over and he could die in peace. He expired on the 29th of September 1560.

Gustavus was thrice married. His first wife, Catherine, daughter of Magnus I., duke of Saxe-Lauenberg, bore him in 1533 his eldest son Eric. This union was neither long nor happy, but the blame for its infelicity is generally attributed to the lady, whose abnormal character was reflected and accentuated in her unhappy son. Much more fortunate was Gustavus's second marriage, a year after the death of his first consort, with his own countrywoman, Margaret Lejonhufvud, who bore him five sons and five daughters, of whom three sons, John, Magnus and Charles, and one daughter, Cecilia, survived their childhood. Queen Margaret died in 1557; and a twelvemonth later Gustavus wedded her niece, Catharine Stenbock, a handsome girl of sixteen, who survived him more than sixty years.

Gustavus's outward appearance in the prime of life is thus described by a contemporary: "He was of the middle height, with a round head, light yellow hair, a fine long beard, sharp eyes, a ruddy countenance... and a body as fitly and well proportioned as any painter could have painted it. He was of a sanguine-choleric temperament, and when unnerved and vexed a bright and cheerful gentleman, easy to get on with, and however many people happened to be in the same room with him, he was never at a loss for an answer to every one of them. Learned he was not, but he had naturally bright and clear understanding, an unusually good memory, and a marvellous capacity for taking pains. He was also very devout, and his morals were irreproachable. On the other hand, Gustavus had his full share of the family failings of irritability and suspiciousness, the latter quality becoming almost morbid under the pressure of adverse circumstances. His energy too not infrequently degenerated into violence, and when crossed he was apt to be tyrannical.

The Reformation in Sweden (New York, 1883); Sveriges Historia (Stockholm, 1877-1881); J. Weiding, Schwedische Geschichte im Zeitalter der Reformation (Gotha, 1882).

GUSTAVUS II. ADOLPHUS (1594-1632), king of Sweden, the eldest son of Charles IX. and of Christina, daughter of Adolphus, duke of Holstein-Gottorp, was born at Stockholm castle on the 9th of December 1594. From the first he was carefully nurtured to be the future prop of Protestantism by his austere parents. Gustavus was well grounded in the classics, and his linguistic accomplishments were extraordinary. He may be said to have grown up with two mother-tongues, Swedish and Latin. He became a veritable master of French, Dutch, and Italian, and he learned subsequently to express himself in Spanish, Russian, and Polish. But his practical father took care that he should grow up a prince, not a pedant. So early as his ninth year he was introduced to public life; at thirteen he received petitions and conversed officially with the foreign ministers; at fifteen he administered his duchy of Westmanland and opened the Örebro diet with a speech from the throne; indeed from 1610 he may be regarded as his father's co-regent. In all martial and chivalrous accomplishments he was already an adept; and when, a year later, he succeeded to the supreme power, his superior ability was as uncontested as it was incontestable.

The first act of the young king was to terminate the fratricidal struggle with Denmark by the peace of Knäred (28th of January 1613). Simultaneously, another war, also an heritage from Charles IX., had been proceeding in the far distant regions round lakes Ilmen, Peipus and Ladoga, with Great Novgorod as its centre. It was not, however, like the Danish War, a national danger; but a political speculation meant to be remunerative and compensatory, and was concluded very advantageously for Sweden by the peace of Stolbova on the 37th of February 1617 (see SWEDEN: History). By this peace Gustavus succeeded in excluding Muscovy from the Baltic. "I hope to God," he declared to the Stockholm diet in 1617, when he announced the conclusion of peace, "that the Russians will feel it a bit difficult to skip over that little brook." The war with Poland which Gustavus resumed in 1621 was a much more difficult affair. It began with an attack upon Riga as the first step towards conquering Livonia. Riga was invested on the 13th of August and surrendered on the 15th of September; on the 3rd of October Miltau was occupied; but so great were the ravages of the Swedes during the campaign, that the Swedish army had to be reinforced by no fewer than 10,000 men. A truce was thereupon concluded and hostilities were suspended till the summer of 1625, in the course of which Gustavus took Kokenhusen and invaded Lithuania. In January 1626 he attacked the Poles at Walhof and scattered the whole of their army after slaying a fifth part of it. This victory, remarkable besides as Gustavus's first pitched battle, completed the conquest of Livonia. As, however, it became every year more difficult to support an army in the Divna district, Gustavus now resolved to transfer the war to the Prussian provinces of Poland with a view to securing the control of the Vistula, as he had already secured the control of the Dvina. At the end of 1626, the Swedish fleet, with 14,000 men on board, anchored in front of the chain of sand-dunes which separates the Frische-Haff from the Baltic. Pillau, the only Baltic port then accessible to ships of war, was at once occupied, and Königsberg shortly afterwards was scared into an unconditional neutrality. July was passed in conquering the bishopric of Ermland. The surrender of Ellbing and Marienburg placed Gustavus in possession of the fertile and easily defensible delta of the Vistula, which he treated, as a permanent conquest, making Axel Oxenstjerna its first governor-general. Communications between Danzig and the sea were cut off by the erection of the first of Gustavus's famous entrenched camps at Dirschau. From the end of August 1626 the city was blockaded, and in the meantime Polish irregulars, under the capable Stanislaus Koniecpolski, began to harass the Swedes. But the object of the campaign, a convenient basis of operations, was won; and in October the king departed to Sweden to get reinforcements. He returned in May 1627 with 7000 men, which raised his forces to 14,000, against which Koniecpolski could only oppose 9000. But his superior strategy frustrated all the efforts of the Swedish king, who in the course of the year was twice dangerously wounded and so disabled that he could never wear armour again. Gustavus had made extensive preparations for the ensuing campaign and took the field with 32,000 men. But once again, though far outnumbered, and unsupported by his own government, the Polish grand-hetman proved more than a match for Gustavus, who, on the 10th of September, broke up his camp and returned to Prussia; the whole autumn campaign had proved a failure and cost him 5000 men. During the ensuing campaign of 1629 Gustavus had to contend against the combined forces of the Polish king, the Catholic archbishop of Cologne, and the Hanseatic towns, but the Polish commander now showed the Swedes what he could do with adequate forces. At Stuthm, on the 29th of June, he defeated Gustavus, who lost most of his artillery and narrowly escaped capture. The result of the campaign was the conclusion of the six years' truce of Almattk, which was very advantageous to Sweden.

And now Gustavus turned his attention to Germany. The motives which induced the Swedish king to intervene directly in the Thirty Years' War, and to interest himself in his correspondence with Oxenstjerna. Here he says, planning to compel the emperor to acquire the Baltic ports and proceed to build up a sea-power dangerous to Scandinavia. For the same reason, the king rejected the chancellor's alternative of waging a simply defensive war against the emperor by means of the fleet, with Stralsund as his base. He was convinced by the experience of Christian IV. of Denmark that the enemies' harbours could be wrested from them only by a successful offensive war on land; and, while quite alive to the risks of such an enterprise in the face of two large armies, Tilly's and Wallenstein's, each of them larger than his own, he argued that the vast extent of territory and the numerous garrisons which the enemy was obliged to maintain, more than neutralized his numerical superiority.

Merely to blockade all the German ports with the Swedish fleet was equally impossible. The Swedish fleet was too weak for that; it would be safer to take and fortify the pick of them. In Germany itself, if he once got the upper hand, he would not find himself without resources. It is no enthusiastic crusader, but an anxious and farseeing if somewhat speculative statesman who thus opens his mind to us. No doubt religious considerations were uppermost in his soul. He had the common sympathy for his fellow-Protestants in Germany; he regarded them as God's peculiar people, himself as their divinely appointed deliverer. But his first duty was to Sweden; and, naturally and rightly, he viewed the whole business from a predominantly Swedish point of view. Luthersans and Calvinists were to be delivered from a "soul-crushing tyranny"; but they were to be delivered by a foreign if friendly power; and that power claimed as her reward the hegemony of Protestant Europe and all the political privileges belonging to that exalted position.

On the 10th of May 1630 Gustavus solemnly took leave of the estates of the realm assembled at Stockholm. He appeared before them holding in his arms his only child and heiress, the little princess Christina, then in her fourth year, and tenderly committed her to the care of his loyal and devoted people. Then he solemnly took the estates to witness, as he stood there "in the sight of the Almighty," that he had begun hostilities "out of no lust for war, as many will certainly devise and imagine," but in self-defence and to deliver his fellow-Christians from oppression. On the 7th of June 1630 the Swedish fleet set sail, and two days after midsummer night the Swedes made landfall at Peenemünde. Gustavus's plan was to take possession of the mouths of the Oder Half, and, resting upon Stralsund in the west and Prussia in the east, penetrate into Germany. In those days rivers were what railways now are, the great military routes; and Gustavus's German war was a war waged along river lines. The opening campaign was to be fought along the line of the Oder. Stettin, the capital of Pomerania, and the key of the Oder line, was occupied and converted into a first-class fortress. He then proceeded to clear Pomerania of the piebald imperial host composed of every nationality under
GUSTAVUS III.

heaven, and officered by Italians, Irishmen, Czechs, Croats, Danes, Spaniards and Walloons. Gustavus's army has often been described by German historians as an army of foreign invaders; in reality it was far more truly Teutonic than the official defenders of Germany at that period. Gustavus's political difficulties (see Sweden: History) chain him to his camp for the remainder of the year. But the dismissal of Wallenstein and the declaration in Gustavus's favour of Magdeburg, the greatest city in the Lower Saxon Circle, and strategically the strongest fortress of North Germany, encouraged him to advance boldly. But first, honour as well as expediency moved him to attempt to relieve Magdeburg, now closely invested by the imperialists, especially as his hands had now been considerably strengthened by a definite alliance with France (treaty of Bärwalde, 13th of January 1631). Magdeburg, therefore, became the focus of the whole campaign of 1632; but the obstructive timidity of the electors of Brandenburg and Saxony threw insuperable obstacles in his way, and, on the very day when John George I. of Saxony closed his gates against Gustavus the most populous and prosperous city in North Germany became a heap of smoking ruins (20th of May). Gustavus, still too weak to meet the foe, entrenched himself at Werben, at the confluence of the Havel and Elbe. Only on the 12th of September did the elector of Saxony, alarmed for the safety of his own states, now invaded by the emperor, place himself absolutely at the disposal of Gustavus; and, five days later, at the head of the combined Swedish-Saxon army, though the Swedes did all the fighting, Gustavus routed Tilly at the famous battle of Breitenfeld, north of Leipzig.

The question now was: In what way should Gustavus utilize his advantage? Should he invade the Austrian crown lands, and dictate peace to Ferdinand II. at the gates of Vienna? Or should he pursue Tilly westwards and crush the league at its own hearth and home? Oxenstierna was the first alternative, but Wallenstein opposed it. His policy had been greatly blamed. More than one modern historian has argued that if Gustavus had done in 1631 what Napoleon did in 1803 and 1809, there would have been a fifteen instead of a thirty years' war. But it should be borne in mind that, in the days of Gustavus, Vienna was by no means so essential to the existence of the Habsburg monarchy as it was in the days of Napoleon; and even Gustavus could not allow so dangerous an opponent as Tilly time to recover himself. Accordingly, he set out for the Rhine, taking Marienberg and Frankfort on his way, and on the 20th of December entered Mainz, where he remained till the beginning of the winter of 1631–1632. At the beginning of 1632, in order to bring about the general peace he so earnestly desired, he proposed to take the field with an overwhelming numerical majority. The signal for Gustavus to break up from the Rhine was the sudden advance of Tilly from behind the Danube. Gustavus pursued Tilly into Bavaria, forced the passage of the Danube at Donauworth and the passage of the Lech, in the face of Tilly's strongly entrenched camp at Rain, and pursued the flying foe to the fortress of Ingolstadt where Tilly died of his wounds a fortnight later. Gustavus then liberated and garrisoned the long-pressed Protestant cities of Augsburg and Ulm, and in May occupied Munich. The same week Wallenstein chased John George from Prague and manoeuvred the Saxons out of Bohemia. Then, armed as he was with plenipotentiary power, he offered the elector of Saxony peace on his own terms. Gustavus suddenly saw himself exposed to extreme peril. If Tilly had made John George such an offer as Wallenstein was now empowered to make, the elector would never have become Gustavus's ally; would Tilly take Gustavus's ally now? Hastily quitting his quarters in Upper Silesia, Gustavus hastened towards Nuremberg on his way to Saxony, but finding that Wallenstein and Maximilian of Bavaria had united their forces, he abandoned the attempt to reach Saxony, and both armies confronted each other at Nuremberg which furnished Gustavus with a point of support of the first order. He quickly converted the town into an entrenched and fortified camp. Wallenstein followed the king's example, and entrenched himself on the western bank of the Regnitz in a camp twelve English miles in circumference. His object was to pin Gustavus fast to Nuremberg and cut off his retreat northwards. Throughout July and August the two armies faced each other immovably. On the 24th of August, after an unsuccessful attempt to storm Alte Veste, the key of Wallenstein's position, the Swedes dispersed.

Towards the end of October, Wallenstein, after devastating Saxony, was preparing to go into winter quarters at Lützen, when the king surprised him as he was crossing the Rippach (1st of November) and a rearguard action favourable to the Swedes ensued. Indeed, but for nightfall, Wallenstein's scattered forces might have been routed. During the night, however, Wallenstein re-collected his host for a decisive action, and at daybreak on the 6th of November, while an autumn mist still lay over the field, the battle began. It was obviously Gustavus's plan to drive Wallenstein away from the Leipzig road, north of which he had posted himself, and thus, in case of success, to isolate, and subsequently, with the aid of the Saxons in the Elbe fortresses, annihilate him. The king, on the Swedish right wing, succeeded in driving the enemy from the trenches and capturing his cannon. What happened after that is mere conjecture, for a thick mist now obscured the autumn sun, and the battle became a colossal mêlée the details of which are indistinguishable. It was in the midst of that awful obscurity that Gustavus met his death—how or where is not absolutely certain; but it would seem that he lost his way in the darkness while leading the Småland horse to the assistance of his infantry, and was despatched as he lay severely wounded on the ground by a hostile horseman.

By his wife, Marie Eleonora, a sister of the elector of Brandenburg, whom he married in 1620, Gustavus Adolphus had one daughter, Christina, who succeeded him on the throne of Sweden. See Sveriges Historia (Stockholm, 1877, 81), vol. iv.; A. Oxenstierna, Skrifter och Breersedel (Stockholm, 1860, etc.); G. Björken, Karl Gustaf I och II (Stockholm, 1890); R. N. Bain, Scanodynamia (Cambridge, 1905); C. R. L. Fletcher, Gustavus Adolphus (London, 1892); J. L. Stevens, History of Gustavus Adolphus (London, 1888); C. J. Bluemel, Gustav Adolf, König von Schweden (Eisleben, 1894); A. Rydoffs, De diplomatiska förbindelserna mellan Sverige och England 1624–1630 (Upsala, 1890).

Gustavus III. (1746–1792), king of Sweden, was the eldest son of Adolphus Frederick, king of Sweden, and Louisa Ulrica of Prussia, sister of Frederick the Great, and was born on the 24th of January 1746. Gustavus was educated under the care of two governments which were among the most enlightened of their time. He owed more perhaps to the poet and historian Olof von Dalin. The interference of the state with his education, when he was a child, was, however, doubly harmful, as his parents taught him to despise the preceptors imposed upon him by the diet, and the atmosphere of intrigue and duplicity in which he grew up made him precociously experienced in the art of dissimulation. But even his most hostile teachers were amazed by the brilliance of his natural gifts, and, while still a boy, he possessed that charm of manner which was to make him so fascinating and so dangerous in later life, coupled with the strong dramatic instinct which won for him his honourable place in Swedish literature. On the whole, Gustavus cannot be said to have been well educated, but he read very widely; there was scarce a French author of his day with whose works he was not intimately acquainted; while his enthusiasm for the new French ideas of enlightenment was as sincere as, if more critical than, his mother's. On the 4th of November 1766, Gustavus married Sophia Magdalena, daughter of Frederick V. of Denmark. The match was welcomed by all, excepting only Gustavus, who was, indeed, one of the most unhappy men of his time, but still more to the mischievous interference of the jealous queen-mother.

Gustavus first intervened actively in politics in 1768, at the time of his father's interregnum, when he compelled the dominant Cap faction to summon an extraordinary diet from which he hoped for the reform of the constitution in a monarchical direction. But the victorious Hats refused to redeem the pledges which they had given before the elections. 'That we should have lost the
constitutional battle does not distress us so much," wrote Gustavus, in the bitterness of his heart; "but what does dismay me is to see my poor nation so sunk in corruption as to place its own felicity in absolute anarchy." From the 4th of February to the 25th of March 1771, Gustavus was at Paris, where he carried both the court and the city by storm. The poets and the philosophers paid him enthusiastic homage, and all the distinguished women of the day testified to his superlative merits. With many of them he maintained a lifelong correspondence. But his visit to the French capital was no mere pleasure trip; it was also a political mission. Confidential agents from the Swedish court had already prepared the way for him, and the duc de Choiseul, weary of Swedish anarchy, had resolved to discuss with him the best method of bringing about a revolution in Sweden. Before he departed, the French government undertook to pay the outstanding subsidies to Sweden unconditionally, at the rate of one and a half million livres annually, and the comte de Vergennes, one of the great names of French diplomacy, was transferred from Constantinople to Stockholm. On his way home Gustavus paid a short visit to his uncle, Frederick the Great, at Potsdam. Frederick bluntly informed his nephew that, in concert with Russia and Denmark, he had guaranteed the integrity of the existing Swedish constitution, and significantly advised the young monarch to play the part of mediator and abstain from violence.

On his return to Sweden Gustavus made a sincere and earnest attempt to mediate between the Hats and Caps who were ruining the country between them (see Sweden: History). On the 21st of June 1771 he opened his first parliament in a speech which awakened strange and deep emotions in all who heard it. It was the first time for more than a century that a Swedish king had addressed a Swedish diet from the throne in its native tongue. The orator laid especial stress on the necessity of the sacrifice of all party animosities to the common weal, and volunteered, as "the first citizen of a free people," to be the mediator between the contending factions. A composition committee was actually formed, but it proved illusory from the first, the patriotism of neither of the factions being equal to the purest act of self-denial. The subsequent attempts of the dominant Caps still further to limit the prerogative, and reduce Gustavus to the condition of a roiistant, induced him at last to consider the possibility of a revolution. Of its necessity there could be no doubt. Under the sway of the Cap faction, Sweden, already the vassal, could not fail to become the prey of Russia. She was on the point of being absorbed in that northern system, the invention of the Russian vice-chancellor, Count Nikita Panin, which that patient statesman had made it the object of his life to realize. Only a swift and sudden coup d'etat could save the independence of a country isolated from the rest of Europe by a hostile league. At this juncture Gustavus was approached by Jakob Magnus Sprengtporten, a Finnish nobleman of determined character, who had incurred the enmity of the Caps, with the project of a revolution. He undertook to seize the fortress of Sveaborg by a coup de main, and, Finland once secured, Sprengtporten proposed to embark for Sweden, meet the king and his friends near Stockholm, and surprise the capital by a night attack, and then, by the use of bayonet, to accept a new constitution from the untrammed king. The plotters were at this juncture reinforced by an ex-refugee from Scania (Skåne), Johan Kristoffer Toll, also a victim of Cap oppression. Toll proposed that a second revolt should break out in the province of Scania, to confuse the government still more, and undertook personally to secure the southern fortress of Kristianstad. After some debate, it was finally arranged that, a few days after the Finnish revolt had begun, Kristianstad should openly declare against the government. Prince Charles, the eldest of the king's brothers, was thereupon hastily to mobilize the garrisons of all the southern fortresses, for the ostensible purpose of crushing the revolt at Kristianstad; but on arriving before the fortress he was to make common cause with the rebels, and march upon the capital from the south, while Sprengtporten attacked it simultaneously from the east. On the 6th of August 1772 Toll succeeded, by sheer bluff, in winning the fortress of Kristianstad. On the 16th Sprengtporten succeeded in surprising Sveaborg. But contrary winds prevented him from crossing to Stockholm, and in the meanwhile events had occurred which made his presence there unnecessary.

On the 25th of August, the Cap leader, Ture Rudbeck, arrived at Stockholm with the news of the insurrection in the south, and Gustavus found himself isolated in the midst of enemies. Sprengtporten lay weather-bound in Finland, Toll was five hundred miles away, the Hat leaders were in hiding. Gustavus thereupon resolved to strike the decisive blow without waiting for the arrival of Sprengtporten. He acted with military promptitude. On the evening of the 18th all the officers whom he thought he could trust received secret instructions to assemble in the great square facing the arsenal on the following morning. At ten o'clock on the 19th Gustavus mounted his horse and rode straight to the arsenal. On the way his adherents joined him in little groups, as if by accident, so that by the time he reached his destination he had about two hundred officers in his suite. After parade he reconducted them to the guard-room of the palace and unfolded his plans to them. He then dictated a new oath of allegiance, and every one signed it without hesitation. It absolved them from their allegiance to the estates, and bound them solely to obey their lawful king, Gustavus III. Meanwhile the senate and the governor-general, Rudbeck, had been arrested and the Senate secured. Then Gustavus mounted the stalls and everywhere received by enthusiastic crowds, who hailed him as a deliverer. On the evening of the 20th heralds perambulated the streets proclaiming that the estates were to meet in the Rikssal on the following day; every deputy absenting himself would be regarded as the enemy of his country and his king. On the 21st, a few moments after the estates had assembled, the king in full regalia appeared, and taking his seat on the throne, delivered that famous philippic, one of the masterpieces of Swedish oratory, in which he reproached the estates for their unpatriotic venality and tyranny in the past. A new constitution was rejected by the estates and accepted by them unanimously. The diet was then dissolved.

Gustavus was inspired by a burning enthusiasm for the greatness and welfare of Sweden, and worked in the same reformatory direction as the other contemporary sovereigns of the "age of enlightenment." He took an active part in every department of business, but relied far more on extra-official counsellors of his own choosing than upon the senate. The effort to remedy the frightful corruption which had been fostered by the Hats and Caps engaged a considerable share of his time and he even found it necessary to put the whole of a supreme court of justice (Göta Hofsätt) on its trial. Measures were also taken to reform the administration and the whole course of judicial procedure, and torture as an instrument of legal investigation was abolished. In 1774 an ordinance providing for the liberty of the press was even issued. The national defences were at the same time developed on a "Great Power" scale, and the navy was so enlarged as to become one of the most formidable in Europe. The dilapidated finances were set in good order by the "currency realization ordinance" of 1777. Gustavus also introduced new nationalistic and economic principles. In 1775 free trade in corn was promoted and a number of oppressive export-tolls were abolished. The poor law was also amended, absolute religious liberty was proclaimed, and he even succeeded in inventing and popularizing a national costume which was in general use from 1778 till his death. His one great economic blunder was the attempt to make the sale of spirits a government monopoly, which was an obvious infringement upon the privileges of the estates. His foreign policy, on the other hand, was at first both wise and wary. Thus, when the king of Prussia, Frederick II, invited Gustavus to Stockholm on the 3rd of September 1778, he could give a brilliant account of his six years' stewardship. Never was a parliament more obsequious or a king more gracious. "There was no room for a single No during the whole session." Yet, short as the session was, it was quite long enough to open the eyes of the deputies to the fact that their political supremacy had
departed. They had changed places with the king. He was now indeed their sovereign lord; and, for all his gentleness, the jealousy with which he guarded, the vigour with which he enforced the prerogative, plainly showed that he meant to remain so. Even the few who were patriotic enough to acquiesce in the change by no means resented it (Sveriees historia av Gustafus IV, 1798). The diet of 1786 was mutinous. The consequence was that nearly all the royal propositions were either rejected outright or so modified that Gustavus himself withdrew them.

The diet of 1786 marks a turning-point in Gustavus's history. Henceforth we observe a determination on his part to rule without a parliament; a passage, cautious and gradual, yet unflinching, from semi-constitutionalism to semi-absolutism. His opportunity came in 1788, when the political complications arising out of the Turkish war were, in the midst of the fullness of life, the sovereigns of Europe beheaded, either of their flesh and 7000 men. A month later, on the 14th of August 1790, peace was signed between Russia and Sweden at Värilä. Only eight months before, Catherine had hautly declared that "the odious and revolting aggression" of the king of Sweden would be "forgiven" only if he "testified his repentance" by agreeing to a peace granting a general and unlimited amnesty to all his rebels, and consenting to a guarantee by the Swedish diet ("as it would be impudent to confide in his good faith alone") for the observance of peace in the future. The peace of Värilä saved Sweden from any such fate. In the spring of 1792 Gustavus took the bold but by no means imprudent step of concluding an eight years' defensive alliance with the empire, whereby he was to supply her new addition to his annual subsidies amounting to 300,000 roubles.

Gustavus now aimed at forming a league of princes against the Jacobins, and every other consideration was subordinated thereto. His profound knowledge of popular assemblies enabled him, alone among contemporary sovereigns, accurately to gauge from the first the scope and bearing of the French Revolution. But he was hampered by poverty and the jealousy of the other European Powers, and, after showing once more his unprivalled mastery over masses of men at the brief Gefle diet (22nd of January-24th of February 1792), he fell a victim to a widespread aristocratic conspiracy. Shot in the back by Anckerström at a midnight masquerade at the Stockholm opera-house, on the 16th of March 1792, he expired on the 29th.

Although he may be charged with many foibles and extravagances, Gustavus III. was indisputably one of the greatest sovereigns of the 18th century. Unfortunately his genius had not full scope; his opportunity came too late. Gustavus was, moreover, a most distinguished author. He may be said to have created the Swedish theatre, and some of the best acting dramas in the literature are by his hand. His historical essays, notably the famous anonymous eulogy on Torstenson crowned by the Academy, are full of feeling and exquisite in style,—his letters to his friends are delightful. Every branch of literature and art interested him, every poet and artist of his day found in him a most liberal and sympathetic protector.

GUSTAVUS IV. (1778-1837), king of Sweden, the son of Gustavus III. and Queen Sophia Magdalena, was born at Stockholm on the 1st of November 1778. Carefully educated under the direction of Nils von Rosenstein, he grew up serious and conscientious. In August 1796 his uncle the regent Charles, duke of Sudderland, visited Petersburg for the purpose of arranging a marriage between the young king and Catherine (Uppsala, 1785), the daughter of the grand-duchesse Alexandra. The betrothal was actually fixed for the 22nd of September, when the whole arrangement foundered on the obstinate refusal of Gustavus to allow his destined bride liberty of worship according to the rites of the Greek Orthodox Church—a rebuff which undoubtedly accelerated the death of the Russian empress. Nobody seems to have even suspected at the time that serious mental derangement lay at the root of Gustavus's abnormal piety. On the contrary, violence had many who prematurely congratulated themselves on the fact that Sweden had now no disturbing genius, but an economical, God-fearing, commonplace monarch to deal with.

Gustavus's prompt dismissal of the generally detested Gustaf Reuterholm added still further to his popularity. On the 31st of October 1797 Gustavus married Frederica Dorothea, daughter of Charles Frederick, grand-duke of Baden, a marriage which might have led to a war with Russia but for the fanatical hatred of the French republic shared by the emperor Paul and Gustavus IV., which served as a bond of union between them. Indeed the king's honor of Jacobins was morbid in its intensity, and for the first time in his life he adopted all the maxims of the revolution and postponed his coronation for some years, so as to avoid calling together a diet; but the disorder of the finances, caused partly by the continental war and partly by the almost total failure of the crops in 1798 and 1799, compelled him to summon the estates to Norrköping in March 1800, and on the 3rd of April Gustavus was crowned. The notable change which now took place in Sweden's foreign policy and its fatal consequences to the country are elsewhere set forth (see Sweden, History). By the end of 1806 it was obvious to every thinking Swede that the king was insane, and violence had alienated his most faithful supporters, while his obstinate incompetence paralysed the national efforts. To remove a madman by force was the one remaining expedient; and this was successfully accomplished by a conspiracy of officers of the western army, headed by Adlersparre, the Anckarvars, and Adlerscreuzt, who marched rapidly from Skåne to Stockholm. On the 13th of March 1807 some of the conspirators broke into the royal apartments in the palace unannounced, seized the king, and conducted him to the château de Gripsholm; Duke Charles was easily persuaded to accept the leadership of a provisional government, which he held for the same day, and a diet, hastily summoned, solemnly approved of the revolution. On the 29th of March Gustavus, in order to save the crown for his son, voluntarily abdicated; but on the 10th of May the estates, dominated by the army, declared that not merely Gustavus but his whole family had forfeited the throne. On the 5th of June the duke regent was proclaimed king under the title of Charles XIII., after accepting the new liberal constitution, which was ratified by the diet the same day. In December Gustavus and his family were transported to Germany. Gustavus now assumed the title of Duke of Gottorp, but subsequently called himself Colonel Gustafsson, under which pseudonym he wrote most of his works. He led, separated from his family, an erratic life for some years; was divorced from his consort in 1812; and finally settled at St Gall in Switzerland in great loneliness and indigence. He died on the 7th of February 1837, and, at the suggestion of King Oscar II., his body was brought to Sweden and interred in the Riddarholmskyrka. From him descend both the Baden and the Oldenburg princely houses on the female side.

GUSTAVUS V. (1838—), king of Sweden, son of Oscar II., king of Sweden and Norway, and Queen Sophia Wilhelmina, was
GUSTAVUS ADOLPHUS UNION - GUTENBERG

born at Drottningholm on the 16th of June 1598. He entered the army, and was, like his father, a great traveller. As crown prince he held the title of duke of Wärmland. He married in 1882 Victoria (b. 1862), daughter of Frederick William Louis, grand duke of Baden, and of Louise, princess of Prussia. The duchess of Baden was the granddaughter of Sophia, princess of Sweden, and the marriage of the crown prince thus effected a union between the Bernadotte dynasty and the ancient Swedish royal house of Vasa. During the absence or illness of his father Gustavus repeatedly acted as regent, and was therefore thoroughly versed in public affairs when he succeeded to the Swedish throne on the 8th of December 1607, the crown of Norway having been separated from that of Sweden in 1905. He took as his motto “With the people for the Fatherland.”

The crown prince, Oscar Frederick William Gustavus Adolphus, duke of Scania (b. 1882), married in 1905 Princess Margaret of Connaught (b. 1882), niece of King Edward VII. A son was born to them at Stockholm on the 2nd of April 1906, and another son in the following year. The king’s two younger sons were William, duke of Siedermania (b. 1884), and Eric, duke of Westphalia (b. 1886).

GUSTAVUS ADOLPHUS UNION (GUSTAV-ADOLPH-STIFTUNG, GUSTAV-ADOLPH-VEREIN, EVANGELISCHER VEREIN DER GUSTAV-ADOLPH-STIFTUNG), a society formed of members of the Evangelical Protestant churches of Germany, which has for its object the aid of feeble sister churches, especially in Roman Catholic countries. The project of forming such a society was first broached in connection with the bicentennial celebration of the battle of Lützen on the 6th of November 1833; a proposal to collect funds for a monument to Gustavus Adolphus having been agreed to, it was suggested by Superintendent Grossmann that the best memorial to the great champion of Protestantism would be the formation of a union for propagating his idea. For some years the society was limited in its area and its operations, being practically confined to Leipzig and Dresden, but at the Reformation festival in 1841 it received a new impulse through the energy and eloquence of Karl Zimmermann (1803–1877), court preacher at Darmstadt, and in 1843 a general meeting was held at Frankfort-on-the-Main, where no fewer than twenty-nine branch associations belonging to all parts of Germany except Bavaria and Austria were represented. The want of a positive creed tended to make many of the stricter Protestant churchmen doubt the usefulness of the union, and the stricter Lutherans have always held aloof from it. On the other hand, its negative attitude in relation to Roman Catholicism secured for it the sympathy of the masses.

At a general convention held in Berlin in September 1846 a keen dispute arose about the admission of the Königsberg delegate, Julius Rupp (1809–1884), who in 1845 had been deprived for publicly repudiating the Athanasian Creed and became one of the founders of the “Free Congregations”; and at one time it seemed likely that the society would be completely broken up. Amid the political revolutions of the year 1848 the whole movement fell into stagnation; but in 1849 another general convention (the seventh), held at Breslau, showed that, although the society had lost both in membership and income, it was still possessed of considerable vitality. From that date the Gustav-Adolf-Verein has been more definitely “evangelical” in its tone than formerly; and under the direction of Karl Zimmermann it greatly increased both in numbers and in wealth. It has built over 2000 churches and assisted with some two million pounds over 3000 different communities. Apart from its influence in maintaining Protestantism in hostile areas, there can be no doubt that the union has had a great effect in helping the various Protestant churches of Germany to realize the number and importance of their common interests.

See K. Zimmermann, Geschichte des Gustav-Adolf-Vereins (Darmstadt, 1877).

GÜSTROW, a town of Germany, in the grand duchy of Mecklenburg-Schwerin, on the Nebel and the railway from Lübeck to Stettin, 20 m. S. of Rostock. Pop. (1857), 10,923; (1909) 17,163. The principal buildings are the castle, erected in the middle of the 16th century and now used as a workhouse; the cathedral, dating from the 13th century and restored in 1868, containing many fine monuments and possessing a square tower 100 ft. high; the Pfarrkirche, with fine altar-paintings; the town hall (Rathaus), dating from the 16th century; the music hall, and the theatre. Among the educational establishments are the ducal gymnasium, which possesses a library of 15,000 volumes, a modern and a commercial school. The town is one of the most prosperous in the duchy, and has machine works, foundries, tanneries, sawmills, breweries, distilleries, and manufactories of tobacco, glue, candles and soap. There is also a considerable trade in cattle, and an annual cattle show and horse races are held.

Güstrow, capital of the Mecklenburg duchy of that name, or of the Wend district, was a place of some importance as early as the 12th century, and in 1219 it became the residence of Henry Borwin II., prince of Mecklenburg, from whom it received the Swedish throne. From 1316 to 1436 the town was the residence of the princes of the Wends, and from 1556 to 1605 of the dukes of Mecklenburg-Güstrow. In 1628 it was occupied by the imperial troops, and Wallenstein resided in it during part of the year 1629 and 1630.

GUTENBERG, JOHANN (c. 1398–1468), German printer, is supposed to have been born c. 1398–1400 at Mainz of well-to-do parents, his father being Friele zum Gensfleisch and his mother Elsge Wyrich (or, from her birthplace, zu Gutenberg, the name he adopted). He is assumed to be mentioned under the name of "Ghenchen" in a copy of a document of 1430, and again in a document of c. 1427–1428, but it is not stated where he then resided. On January 16, 1430, his mother arranged with the city of Mainz about an annuity belonging to him; but when, in the same year, some families who had been expelled a few years before were permitted to return to Mainz, Gutenberg appears not to have availed himself of the privilege, as he is described in the act of reconciliation (dated March 28) as "not being in Mainz."

It is therefore assumed that the family had taken refuge in Strasburg, where Gutenberg was residing later. There he is said to have been in 1434, and to have seized and imprisoned the town clerk of Mainz for a debt due to him by the corporation of that city, releasing him, however, at the representations of the mayor and councillors of Strasburg, and relinquishing at the same time all claims to the money (510 Rheindish guilders = about 240 Marks). Between 1434 and 1440, however...

It is difficult to know which of the Gutenberg documents can be trusted and which not. Schorbach, in his recent biography of Gutenberg, accepts and describes 27 of them (Festschrift, 1900, p. 163 sqq.), 17 of which are from his own colophons. Under ordinary circumstances history might be based on them. But it is certain that some so-called Gutenberg documents, not included in the above 27, are forgeries. Fr. J. Bodmann (1754–1820), for many years his predecessor and librarian, forged at least two; one (dated July 20, 1459) he even provided with four forged seals; the other (dated Strasburg, March 24, 1442) purported to be an autograph letter of Gutenberg to a fictitious sister of his named Bertha. Of these two documents the French and German texts were published about 1800–1802; the forger lived for twenty years afterwards but never undeceived the public. Bodmann forged the Gutenberg literature with other fabrications. In fact Bodmann had trained himself for counterfeiting MSS. and documents; he openly boasted of his abilities in this respect, and used them, sometimes to amuse his friends who were searching for original documents for him and providing him with copies of other documents, and sometimes for his own ends (as in the case of the "Wencker" and the "St Thomas's" of Strasbourg). For instance, of the above document of 1454 no original has ever come to light; while the draft of the letter of the invigilation, altered by Bodmann in the registry of contracts, and to have been found about 1740 by Wencker, has also disappeared with the register itself. The document (now only preserved from a copy made much later) in the draft is upheld as genuine by Schorbach, who favours an invention of printing at Strasbourg, but Bockenheimer, though supporting Gutenberg and Mainz, declares it to be a fiction (Gutenberg-Fei, Mainz, 1900, pp. 24–33). Again, suspicions are justified.
GUTENBERG

represent him as having been engaged there in some experiments requiring money, with Andreas Dritzehn, a fellow-citizen, who became not only security for him but his partner to carry out Gutenberg's plan for polishing stones and the manufacture of looking-glasses, for which a lucrative sale was expected at the approaching pilgrimage of 1440 (subsequently postponed, according to the documents, although there is no evidence for this postponement) to Aix-la-Chapelle. Money was lent for this purpose by two other friends. In 1438 another partnership was arranged between Gutenberg, Andreas Dritzehn, and Andreas and Hans Heilmann, and that this had in view the art of printing has been inferred from the word "drucken" used by one of the witnesses in the law proceedings which soon followed. An action was brought, after the death of Dritzehn, by his two brothers to force Gutenberg to accept them as partners in their brother's place, but the decision was in favour of the latter. In 1447 Gutenberg became surety to the St Thomas Chapter at Strassburg for Johann Karle, who borrowed 500 guilders (about £60) from the chapter, and on November 17, 1442, he himself borrowed 800 livres through Martin Brechter (or Brecher) from the City Library of Strassburg, whether it was on the 12th or 13th of November (1442) when he paid a tax at Strassburg to the 17th of October 1448 nothing certain is known. But on the latter date we find him at Mainz, borrowing 150 gold guilders of his kinsman, Arnold Gelthus, against an annual interest of 7½ gold guilders. We do not know whether the interest on this debt ever has been paid, but the debt itself appears never to have been paid off, as the contract of this loan was renewed (vidimus) on August 23, 1505, for other parties. It is supposed that soon afterwards Gutenberg must have been able to show some convincing results of his work, for it appears that about 1450 Johann Fust (9½) advanced him 800 guilders to promote it, on no security except that of "tools" still to be made. Fust seems also to have undertaken to advance him 300 guilders a year for expenses, wages, house-rent, parchment, paper, ink, &c., but he does not appear to have ever done so. If at any time they disagreed, Gutenberg was to return the 800 guilders, and the "tools" were to cease to be security. It is not known to what purpose Gutenberg devoted the money advanced to him. In the minutes of the law-suit of 1455 he himself says that he had to make his "tools" with it. But he is presumed to have begun a large folio Latin Bible, and to have printed during its progress some smaller books1 and likewise the Letter of Indulgence (granted on the 12th of April 1451 by Pope Nicholas V. in aid of John II., king of Cyprus, against the Turks), of 31 lines, having the earliest printed date 1454, of which several copies are preserved in various European libraries. A copy of the 1455 issue of this same Indulgence is in the Rylands Library at Manchester (from the Althorp Library).

It is not known whether any books were printed while this partnership between Gutenberg and Fust lasted. Trithemius (Ann. Histriae. ii. 421) says they first printed, from wooden blocks, a vocabulary called Catholicon, which cannot have been the Catholicon of Johannes de Janu, a folio of 748 pages in two columns of 66 lines each, printed in 1460, but was perhaps a small glossary now lost.2 The Latin Bible of 42 lines, a folio of 1282 printed pages, in two columns with spaces left for illuminated initials (so called because each column contains 42 lines, and also known as the Mazarin Bible, because the first copy described was found in the library of Cardinal Mazarin), was finished before the 15th of August 1455;3 German bibliographers now claim this Bible for Gutenberg, but, according to bibliographical rules, it must be ascribed to Peter Schöffner, perhaps in partnership with Fust. It is in smaller type than the Bible of 36 lines, which latter is called either (a) the Bamberg Bible, because nearly all the known copies were found in the neighbourhood of Bamberg, or (b) Schöffner's Bible, because its printing is ascribed to Albrecht Fister of Bamberg, who used the same type for several small German books, the chief of which is Boner's Edistein (1461, 410, 58 leaves, with 85 woodcuts, a book of fables in German rhyme). Some bibliographers believe this 56-line Bible to have been begun, if not entirely printed, by Gutenberg during his partnership with Fust, as its type occurs in the 31-line Letters of Indulgences of 1454, was used for the 27-line Donatus (of 1451), and, finally, when found in Fister's possession in 1461, appears to be old and worn, except the additional letters k, v, z required for German, which are clear and sharp like the types used in the Bible. Again, others profess to prove (Dziatzko, Gutenberg's früheste Druckerproben) that Bβ was a reprint of 1452.

Gutenberg's work, whatever it may have been, was not a commercial success, and in 1452 Fust had to come forward with another 800 guilders to prevent a collapse. But some time before November 1455 the latter demanded repayment of his advances (see the Helmsperger Notarial Document of November 6, 1455, in Dziatzko's Beiträge zur Gutenbergfrage, Berlin, 1889), and took legal proceedings against Gutenberg. We do not know the end of these proceedings, but if Gutenberg had prepared any printing materials it would seem that he was compelled to yield up the whole of them to Fust; that the latter removed them to his own house at Mainz, and there, with the assistance of Peter Schöffner, issued various books until the sack of the city in 1462 by Adolphus II. caused a suspension of printing for three years, to be resumed again in 1465.

We have no information as to Gutenberg's activity, and very little of his whereabouts, after his separation from Fust. In a document dated June 21, 1457, he appears as witness on behalf of one of his relatives, which shows that he was then still at Mainz. Entries in the registers of the St Thomas Church at Strassburg may also serve to show that in the summer of 1457 Gutenberg on the 17th of November 1442 (see above) had borrowed from the chapter of that church was regularly paid till the 11th of November 1457, either by himself or by his successors.

---

1 Ulric Zell states, in the Cologne Chronicle of 1499, that Gutenberg and Fust printed a Bible in large type like that used in missals. It has been said that this description applies to the 42-line Bible, as its type is as large as that of most missals printed before 1500, and that the size now called missal type (double pica) was not used until the 16th century. The Bible was true of the smaller missals printed before 1500, some of which are in even smaller type than the 42-line Bible. But many of the large folio missals, as that printed at Mainz by Peter Schöffner in 1486, and a Carthusian missal printed at Spire by Peter Drach about 1490, and the Dominican missal printed by Andrea de Torresani at Venice in 1496, are in as large type as the 56-line Bible. Peter Schöffner (1452-1502) of Geisa, who was a printer between Mainz and Mannheim, who was a copist in Paris in 1449, and whom Fust called his servant (Jarnstus), is said by Trithemius to have discovered an easier way of founding characters, whereby the outlines of the books of the Bible were filled in with a thin punch. Schöffner, in the colophon of the Psalter of 1457, a work which some suppose to have been planned and partly printed by Gutenberg, claims only the mode of printing rubrics and coloured capitals - a process which was common enough by 1457.

2 The Leipzig copy of this Bible (which formerly belonged to Herr Klemm of Dresden) has at the end the MS. year 1543 in old Arabic numerals. But certain circumstances connected with this date make it look very suspicious.
surety, Martin Brechter. But the payment due on the latter date appears to have been delayed, as an entry in the register of that year shows that the chapter had incurred expenses in taking steps to have both Gutenberg and Brechter arrested. This time the difficulties seem to have been removed, but on and after the 11th of November 1458 Gutenberg and Brechter remained in default. The chapter made various efforts, all recorded in their registers, to get their money, but in vain. Every year they recorded the arrears with the expenses to which they were put in their efforts to arrest the defaulters, till at last in 1474 (six years after Gutenberg's death) their names are no longer mentioned.

Meantime Gutenberg appears to have been printing, as we learn from a document dated February 26, 1468, that a synod of Mainz, Dr Conrad Homery (who had formerly been in the service of the elector Count Diether of Ysenburg), had at one time supplied him, not with money, but with some formes, types, tools, implements and other things belonging to printing, which Gutenberg had left after his death, and which had, and still, belonged to him (Homery): this material had come into the hands of Adolf, the bishop of Mainz, who handed it over to the city authorities, the latter undertaking to use it in no other town but Mainz, nor to sell it to any person except a citizen of Mainz, even if a stranger should offer him a higher price for the things. This material has never yet been identified, so that we do not know what types Gutenberg may have had at his disposal; they could hardly have included the types of the Catholicon of 1460, as is suggested, this work being probably executed by Heinrich Bechtermünz (d. 1467), who also owned some formes of the Eltville, or perhaps by Peter Schäffer, who, about 1470, advertised the book as his property (see K. Burger, Buchhändler-Anzeigen). It is uncertain whether Gutenberg remained in Mainz or removed to the neighbouring town of Eltville, where he may have been engaged for a while with the brothers Bechtermünz, who printed there for some time with the types of the 1460 Catholicon.

On the 17th of January 1465 he accepted the post of salaried courtier from the archbishop Adolf, and in this capacity received annually a suit of livery together with a fixed allowance of corn and wine. Gutenberg seems to have died at Mainz in the beginning of 1468, and was, according to tradition, buried in the Franciscan church in that city. His relative Arnold Geltbus erected a monument to his memory near his supposed grave, and forty years afterwards Ivo Wittig set up a memorial tablet at the legal college at Mainz. No books bearing the name of Gutenberg as printer are known, nor is any genuine portrait of him known, those appearing upon medals, statues or engravings plates being all fictitious.

In 1898 the firm of L. Rosenthal, at Munich, acquired a Mistale or Kalendar, in which Ott Hupp, in two treatises published in 1898 and 1902, asserts to have been printed by Gutenberg about 1450, seven years before the 1457 Psalter. Various German bibliographers, however, think that it could not have been printed before 1480, and, judging from the facsimiles published by Hupp, this date seems to be approximately correct.

On the 24th of June 1900 the five-hundredth anniversary of Gutenberg's birth was celebrated in several German cities, notably in Mainz and Leipzig, and most of the recent literature on the invention of printing dates from that time. So far as the author is aware, the earliest presentation of an Astronomical Kalendar was done by the librarian of Wiesbaden, Dr G. Zeidler (Die älteste Gutenbergzeit, Mainz, 1902), apparently printed in the 36-line Bible type, and as the position of the sun, moon and other planets described in this document suits the years 1420, 1448 and 1467, he ascribes the printing of this Kalendar to the year 1447. A fragment of a poem in German, entitled Welterth, said to be printed in the 36-line Bible type, appears to have come into the possession of Herr Eduard Beck at Mainz in 1892, and was presented by him in 1903 to the Gutenberg Museum in that city. Zeidler published a facsimile of it in 1904 (for the Gutenberg Gesellschaft), with a description, in which he places it before the 1447 Kalendar.
GUTHRIE—GUTS-MUTHS

pamphlet elicited a beautiful and sympathetic letter from Lord Jeffrey. A Ragged School was opened on the Castle Hill, which has been the parent of many similar institutions elsewhere, though Guthrie's relation to the movement is best described as that of an apostle rather than a founder. He insisted on bringing up nearly all the boys, and his influence made his schools proselytizing as well as educational institutions. This interference with religious liberty led to some controversy; and ultimately those who differed from Guthrie founded the United Industrial School, giving combined secular and separate religious instruction. In April 1847, the degree of D.D. was conferred on Guthrie by the university of Edinburgh; and in 1850 William Hanna (1808–1882), the biographer and son-in-law of Thomas Chalmers, was inducted as his colleague in Free St John's Church.

In 1850 Guthrie published A Plea on behalf of Drunkards and against Drunkenness, which was followed by The Gospel in Eschelid (1855); The City: its Sins and Sorrows (1857); Christ and the Inheritance of the Saints (1858); Seculitude and Harvest of Ragged Schools (1860), consisting of his three Pleas for Ragged Schools. These works had an enormous sale, and portions of them were translated into French and Dutch. His advocacy of temperance had much to do with securing the passing of the Forbes Mackenzie Act, which secured Sunday closing and shorter hours of sale for Scotland. Mr. Gladstone specially quoted him in support of the right. With Bill (1851–1852) he was moderator of the Free Church General Assembly; but he seldom took a prominent part in the business of the church courts. His remarkable oratorical talents, rich humour, genuine pathos and inimitable power of story-telling, enabled him to do good service to the total abstinence movement. He was one of the vice-presidents of the Evangelical Alliance. In 1864, his health being seriously impaired, he resigned public work as pastor of Free St John's (May 17), although his nominal connexion with the congregation ceased only with his death. Guthrie had occasionally contributed papers to Good Words, and, about the time of his retirement from the ministry, he became first editor of the Sunday Magazine, himself contributing several series of papers which were afterwards published separately. In 1865 he was presented with £5,000 as a mark of appreciation from the public. His closing years were spent mostly in retirement; and after an illness of several months' duration he died at St Leonards-on-Sea on the 24th of February 1873.

In addition to the books mentioned above he published a number of books which had a remarkable circulation in England and America, such as Speaking to the Heart (1852); The Way of Life (1862); A Man and the Gospel (1865); The Angel's Song (1865); The Parables (1866); Our Father's Business (1867); Out of Harness (1867); Early Piety (1869); Studies from the Old Testament (1866–1870); Sundays Abroad (1871).

GUTHRIE, THOMAS ANSTY (1856–1926), known by the pseudonym of F. Anstey, English novelist, was born in Kensington, London, on the 8th of August 1856. He was educated at King's College, London, and at Trinity Hall, Cambridge, and was called to the bar in 1880. But the popular success of his story Vice-Versa (1882) with its tosey-turvy substitution of a father for his schoolboy son, at once made his reputation as a humorist of an original type. He published in 1883 a serious novel, The Giant's Robe; but, in spite of its discovery, he succeeded (and again in 1890 with The Portrait) that it was not as a serious novelist but as a humorist that the public insisted on regarding him. As such his reputation was further confirmed by The Black Fodder (1883), A Father's Tale (1885) and several other works. He became an important member of the staff of Punch, in which his "Voces populi" and his humorous parodies of a reciter's stock-piece ("Burglar Bill," &c.) represent his best work. In 1901 his successful farce The Man from Blanleley, based on a story which originally appeared in Punch, was first produced at the Prince of Wales's Theatre, in London.

GUTHRIE, the capital of Oklahoma, U.S.A., and the county-seat of Logan county, extending on both sides of Cottontwood creek, and lying one mile south of the Cimarron river. Pop. (1890) 3,533, (1900) 10,006, (1907) 11,652 (287 negroes); (1910) 11,654. It is served by the Atchison, Topeka & Santa Fe, the Chicago, Rock Island & Pacific, the Missouri, Kansas & Texas, the Fort Smith & Western, and the St Louis, El Reno & Western railways. The city is situated near the mouth of the Cimarron about 90 miles above the mouth of the Arkansas, on an alluvial plain devoted largely to stock-raising and the cultivation of Indian corn, wheat, cotton and various fruits, particularly pecans. Guthrie is one of the headquarters of the Federal courts in the state, the other being Muskogee. The principal public buildings at Guthrie are the state Capitol, the Federal building, the City hall, the Carnegie library, the Methodist hospital and a large Masonic temple. Among the schools are St Joseph's Academy and a state school for the deaf and dumb. Guthrie has a considerable trade with the surrounding country and has cotton gins, a cotton compress, and foundries and machine shops; among its manufactures are cotton-seed oil, cotton goods, flour, cereals, lumber, cigars, brooms and furniture. The total value of the factory product in 1905 was $1,200,662. The municipality owns and operates the waterworks. The city was founded in 1889, when Oklahoma was opened for settlement; and in 1890 it was made the capital of the Territory, and in 1907 when Oklahoma was made a state, it became the state capital.

GUTHRUNG (Guthrinc, d. 980), king of East Anglia, first appearing in the English Annales in the year 875, when he is mentioned as one of three Danish kings who went with the host to Cambridge. He was probably engaged in the campaigns of the next three years, and after Alfred's victory at Edington in 878, Guthrum met the king at Aller in Sommersetshire and was baptized there under the name of Æthelstan. He stayed there for twelve years and was greatly honoured by his godfather Alfred. In 890 Guthrum-Æthelstan died: he is then spoken of as "se norberna cyning" (probably) "the Norwegian king," referring to the ultimate origin of his family, and we are told that he was the first (Scandinavian) to settle East Anglia. Guthrum is perhaps to be identified with Gormr (=Guthrum) hinn heimska or hinn riki of the Scandinavian sagas, the fosterfather of Hórfáknar, the father of Gorm the Old. There is a treaty known as the peace of Alfred and Guthrum.

GUTSCHMID, ALFRED, BARON VON (1835–1887), German historian and Orientalist, was born on the 1st of July at Lossow (Dresden). After holding chairs at Kiel (1866), Königsberg (1873), and Jena (1876), he was finally appointed professor of history at Tübingen, where he died on the 2nd of March 1887. He devoted himself to the study of Eastern language and history in its pre-Greek and Hellenistic periods and contributed largely to the literature of the subject.

Works.—Über die Fragmenta des Pompeius Trogus (supplementary vol. of Jahrbücher für klass. Phil., 1887); Die makedonischen Anagnosie (1864); Beiträge zur Gesch. des alten Orient (Leipzig, 1883); Neue Beiträge zur Gesch. des alt. Or., vol. 1. Die Asyriozykloide in Deutschland (Leipzig, 1876); Die Glaubwürdigkeit der armenischen Gesch. des Mose von Khoren (1877); Untersuchungen über die syrische Epoche des eusebischen Canones (1886); Untersuch. über die Gesch. des Königreichs Osraeine (1887); Gesch. Iran. (Alexander the Great to the fall of the Arsacidae) (Tübingen, 1887). He wrote on Persia and Phoenicia in the 9th edition of the Encyc. Brit. A collection of his minor works was published by F. Rühl at Leipzig (1889–1894, 5 vols.), with complete list of his writings. See article by Rühl in Allgemeine deutsche Biographie, xlii. (1904).

GUTS-MUTHS, JOHANN CHRISTOPH FRIEDRICH (1759–1839), German teacher and the principal founder of the German school system of gymnastics, was born at Quedlinburg on the 9th of August 1759. He was thenceforward attached to the Gymnasium and at Halle University; and in 1785 he went to Schепфenthal, where he taught geography and gymnastics. His method of teaching gymnastics was expounded by him in various handbooks; and it was chiefly through them that gymnastics very soon came to occupy such an important position in the school system of Germany. He also did much to introduce a better method of instruction in geography. He died on the 21st of May 1839.
GUTTA—GUTTA PERCHA

His principal works are Gymnastik für die Jugend (1793); Spieße zur Übung und Erhöhung des Körpers und Geistes für die Jugend (1796); Turnerbuch (1798); Handbuch der Geographie (1810); and a number of books constituting a Bibliothek für Pädagogik, Schwulsten und die gesammte pädagogische Literatur Deutschlands. He also contributed to the Vollständiges Hausinventar neuesten Erdebeschreibung, and was a supporter of Deutsches Land and deutsches Volck, the first part, Deutsches Land, being written by him.

GUTTA (Latin for “drop”), an architectural term given to the small frusta of conical or cylindrical form carved below the triglyph and under the regula of the entablature of the Doric Order. They are sometimes known as “trunnels,” a corruption of “tree-nail,” and resemble the wooden pins which in framed timber work or in joinery are employed to fasten together the pieces of wood; these are supposed to be derived from the original timber construction of the Doric temple, in which the pins, driven through the regula, secured the latter to the taenia, and, according to C. Chipiez and F. A. Choisy, passed through the taenia to hold the triglyphs in place. In the earliest examples of the Doric Order at Corinth and Selinus, the guttae are completely isolated from the architrave, and in Temple C at Selinus the guttae are 3 or 4 in. in front of it, so that to enable the pin to be driven in more easily. In later examples they are partly attached to the architrave. Similar guttae are carved under the mutules of the Doric cornice, representing the pins driven through the mutules to secure the rafters. In the temples at Bassae, Paestum and Selinus, instances have been found where the guttae had the plasticity and sunk into the holes cut in the sofit of the mutules and the regula. Their constant employment in the Doric temples suggests that, although originally of constructive origin, they were subsequently employed as decorative features.

GUTTA PERCHA, the name applied to the evaporated milky fluid or latex furnished by several trees chiefly found in the islands of the Malay Archipelago. The name is derived from two Malay words, getah meaning gum, and percha being the name of the tree—probably a Bassao—from which the gum was (erroneously) supposed to be obtained.

Botanical Origin and Distribution.—The actual tree is known to the Malays as taban, and the product as getah taban. The best gutta percha of Malaya is chiefly derived from two trees, and is known as getah taban merah (red) or getah taban sutra (silky). The trees in question, which belong to the natural order Sapotaceae, have now been definitely identified, the first as Dickopis gutta (Bentham and Hooker), otherwise Isonandra gutta (Hooker) or Palaquium gutta (Burck), and the second as Dickopis oblongifolia (Burck). Allied trees of the same genus and of the same natural order give similar results, some of them may be mentioned species of Payena (getah suondie).

Gutta percha trees often attain a height of 70 to 100 ft. and the trunk has a diameter of from 2 to 3 ft. They are stated to be mature when about thirty years old. The leaves of Dickopis, which are obovate-lanceolate, with a distinct pointed apex, occur in clusters at the end of the branches, and are bright green and smooth on the upper surface but on the lower surface are yellowish-brown and covered with silvery hairs. The leaves are usually about 6 in. long and about 2 in. wide at the centre. The branches are large and flexible, and the seeds are contained in an ovoid berry about 1 in. long.

The geographical distribution of the gutta percha tree is almost entirely confined to the Malay Peninsula and its immediate neighbourhood. It includes a region within 6 degrees north and south of the equator and 93°-110° longitude, where the temperature ranges from 66° to 90° F. and the atmosphere is exceedingly moist. The trees may be grown from seeds or from cuttings. Some planting has taken place in Malaya, but little has so far been done to acclimatize the plant in other regions. Recent information seems to point to the possibility of growing the tree in Ceylon and on the west coast of Africa.

Preparation of Gutta Percha.—The gutta is furnished by the greyish milky fluid known as the latex, which is chiefly secreted in cylindrical vessels or cells situated in the cortex, that is, between the bark and the wood (or cambium). Latex also occurs in the leaves of the tree to the extent of about 6% of the dried leaves, and this may be removed from the powdered leaves by the use of appropriate solvents, but the process is not practicable commercially. The latex flows slowly where an incision is made through the bark, but not nearly so freely, even in the rainy season, as the incision made with the knife. The Malays usually fell the tree in order to collect the latex, which is done by chopping off the branches and removing circles of the bark, forming cylindrical channels about an inch wide at various points about a foot apart down the trunk. The latex exudes and fills these channels, from which it is removed and converted into gutta by boiling in open vessels over wood fires. The work is usually carried on in the wet season when the latex is more fluid and more abundant. Sometimes when the latex is thick water is added to it before boiling.

The best results are said to be obtained from mature trees about thirty years old, which furnish about 2 to 3 lb. of gutta. Older trees do not appear to yield larger amounts of gutta, whilst younger trees are said to furnish less and of inferior quality. The trees have been so extensively felled for the gutta that there has been a great diminution in the total number during recent years, which has not been compensated for by the new plantations which have been established.

Uses of Gutta Percha.—The Chinese and Malayas appear to have been acquainted with the characteristic property of gutta percha of retaining its malleability in warm water and of regaining its hardness when cold, for it is said that they had it in this state for the construction of ships, and for insulated electric wires. It has also been used for the manufacture of medical and surgical instruments. Other minor uses are in dentistry and as a means of taking impressions of medals, &c. It has also found application in the preparation of covering for cable and telegraph wires, which led to the discovery of its important applications in this connexion and to a considerable commercial demand for the substance.

The value of gutta percha depends chiefly on its quality, that is its richness in true gutta and freedom from resin and other impurities which interfere with its physical characters, and especially its insulating property to conduct electricity. The chief use of gutta percha is now for electrical purpouses. Other minor uses are in dentistry and as a means of taking impressions of medals, &c. It has also found application in the preparation of covering for cable and telegraph wires, which led to the discovery of its important applications in this connexion and to a considerable commercial demand for the substance.

Commercial Production.—The amount of gutta percha exported through Singapore from British and Dutch possessions in the East is subject to considerable fluctuation, depending chiefly on the demand for cable and telegraph construction. In 1886 the total export from Singapore was 40,161 cwt., of which Great Britain took 31,666 cwt.; in 1896 the export was 51,982 cwt. of which 29,722 cwt. came to Great Britain; while in 1905, 42,088 cwt. were exported (19,517 cwt. to Great Britain). It has to be remembered that the official returns include not only
gutta percha of various grades of quality but also other inferior products sold under the name of gutta percha, some of which are referred to below under the head of substitutes. The value of gutta percha cannot therefore be correctly gauged from the value of the imports. In the ten years 1896-1906 the best qualities of gutta percha fetched from 4s. to about 7s. per lb. Gutta percha, however, is used for few and special purposes and there is no free market, the price being chiefly a matter of arrangement between the chief producers and consumers.

Characters and Properties.—Gutta percha appears in commerce in the form of blocks or cakes of a dirty grey appearance exhibiting a reddish tinge, and just soft enough to be indented by the nail. It is subject to considerable adulteration, various materials, such as coco-nut oil, being added by the Malays in the preparation. The solid, which is fibrous in texture, hard and inelastic but not brittle at ordinary temperature, becomes plastic when immersed in hot water or exposed to a temperature of about 65°–66°C. in the case of gutta of the first quality, the temperature of softening being dependent on the quality of the gutta employed. In this condition it can be drawn out into threads, but is still inelastic. On cooling again the gutta resumes its hardness without becoming brittle. In this respect gutta percha differs from india-rubber or caoutchouc, which does not become plastic and unlike gutta percha is elastic. This property of softening on heating and solidifying when cooled again is one of the principal original properties of the latter, to be worked into various forms, rolled into sheets or drawn into ropes. The specific gravity of the best gutta percha lies between 0·96 and 1·0. It is not attacked by most liquids, although some remove resins constituent; the best solvents are oils of turpentine, coal-tar oil, carbon bisulphide and chloroform, and light petroleum when hot. Gutta percha is not affected by alkaline solutions or by dilute acids. Strong sulphuric acid chars it when warm, and nitric acid effects complete oxidation. When exposed to air and light, gutta percha rapidly deteriorates, oxygen being absorbed, producing a brittle resinous material.

Chemical Composition.—Chemically, gutta percha is not a single substance but a mixture of several constituents. As the proportions of these constituents in the crude material are not constant, the properties of gutta percha are subject to variation. For electrical purposes it should have a high insulating power and dielectric strength and a low inductive capacity; the possession of these properties is influenced by the resinsous constituents present. The chief constituent of the crude gutta material is the pure gutta, a hydrocarbon of the empirical formula CaH₄. It is therefore isomeric with the hydrocarbon of caoutchouc and with that of oil of turpentine. Accompanying this are two oxygenated resinous constituents—albene Ca₁₀H₁₄O and fluid Ca₁₀H₁₃O—which can be separated from the pure gutta by the use of solvents. Pure gutta is not dissolved by ether and light petroleum in the cold, whereas the resinsous constituents are removed by these solvents. Gutta percha exhibits in an enhanced degree the valuable properties of gutta percha, and the commercial value of the raw material is frequently determined by the proportion of true gutta present. The higher the proportion of this the more valuable is the material, and for all purposes, it is used in commerce. The following are the results of analyses of gutta percha from trees of the genus Dichophis or Palaquium:—

The hydrocarbon of gutta percha, gutta, is closely related in chemical composition to that of caoutchouc, both being distilled at the same temperature both are resolved into a mixture of two simpler hydrocarbons, isoprene (C₄H₈) and caoutchouche or dipentene (C₅H₆), and the latter by further heating can be resolved into isoprene, a hydrocarbon of kerosene which has been produced synthetically and spontaneously reverts to caoutchouc. The precise relationship of isoprene to gutta has not been ascertained, but recently Hareviss has further elucidated the connection between gutta and caoutchouc by showing that under the action of ozone both break up into laevulinc aldehyde and hydrogen peroxide, but differ in the proportions of these products they furnish. The two materials must therefore be regarded as related and possibly derived from a common constitution. Like caoutchouc, gutta percha is able to combine with sulphur, and this vulcanized product has found some commercial application.

Manufacture of Gutta Percha.—Among the earliest patents taken out for the manufacture of gutta percha were those of Charles Hancock, the first of which is dated 1843. The next of a series of patents taken out for the raw gutta percha is cleaned by mechanical whilst in the plastic state. The chopped or sliced material is washed by mechanical means in hot water and forced through a sieve or strainer of fine wire gauze to remove dirt. It is then kneaded or "masticated" by machinery to remove the enclosed water, and is finally transferred whilst still hot and plastic to a machine known as a "pitcher" which is a sort of pulley wheel. Sometimes chemical treatment of the crude gutta percha is resorted to for the purpose of removing the resinosous constituents by the introduction of light petroleum. "Substitutes for Gutta Percha."—For artificial and truly substituting natural and artificial substitutes for gutta percha have been employed. The similar products furnished by other plants than those which yield gutta percha are among the most important of these substitutes, of which the material known as "balata" or "Surinam gutta percha," is the most valuable. This is derived from a tree, Mimusops balata (spotted tree), belonging to the same natural order as gutta percha trees, via. a tree of the Elaeocarpaceae family, the principal of which is rest a piece of 8 to 100 ft., or more, which occurs in the West Indies, in South America, and is especially abundant in Dutch and British Guiana. The fibrous material is obtained by tapping the bark between the cortex between the bark and wood of the tree. As the latex flows, the tree is tapped by making incisions in the same fashion as in India-rubber trees, and the balata is obtained by evaporating the milky fluid. Crude balata values are in commerce, and the balata is obtained by evaporating the milky fluid. Various artificial substitutes for gutta percha have been invented chiefly for use as insulating materials. These often consist of mixtures of bitumen with linseed and other oils, resins, &c., in some cases incorporated with inferior grades of gutta percha.

GUTTER (O. Fr. goutiere, mod. goutièr, from Lat. guta, drop), in architecture, a horizontal channel or trough contrived to carry away the water from a flat or sloping roof to its discharge down a vertical pipe or through a spout or gargoyle; more specifically, but loosely, the similar channel or trough in street, below the pavement. In Greek and Roman temples the cymatium of the cornice is the gutter, and the water was discharged through the mouths of lions, whose heads were carved on the same. Sometimes the cymatium was not carried along the flanks of a temple, in which case the rain fell off the lower edge of the roof tiles. In medieval work the gutter rested partly on the top of the wall and partly on corbel tables, and the water was discharged through gargoyles. Sometimes, however, a parapet or pierced balustrade was carried on the cornice just enclosing the gutter. In buildings of a more ordinary class the parapet is only a continuation of the wall below, and the gutter is set back and carried in a trough resting on the lower end of the roof timbers. The safest course is to have an eaves gutter which projects more or less in front of the wall and is secured to and carried by the rafters of the roof. In Renaissance architecture generally the pierced balustrade of the Gothic and transition work was replaced by a balustrade with vertical balusters. In France a compromise was effected, whereby instead of the horizontal coping of the ordinary gutters, richly carved cresting was employed, of which the earliest example is in the first court of the Louvre by Pierre Lesbac. This exists throughout the French Renaissance, and it is one of its chief characteristic features.
GÜTZLAF—GUY OF WARWICK

Menzel, who invited him to Stuttgart to assist in the editorship of the _Literaturblatt_. At the same time he continued his university studies at Jena, Heidelberg and Munich. In 1833 he published anonymously at Hamburg _Briefe eines Narren an eine Närrin_, and in 1833 appeared at Stuttgart _Maha-Guru, Geschichte eines Gottes_, a fantastic and satirical romance. In 1835 he went to Frankfort, where he founded the _Deutsche Revue_. In the same year appeared _Wally, die Zweiçon_, from the publication of which may be said to date the school of writers who, from their opposition to the literary, social and religious traditions of romanticism, received the name of "Young Germany." The work was directed specially against the Young Germany of the Prussian university introduction and the belief that Germany was incapable of producing a national literature of any quality. However, interest it might have attracted from its own merits was enhanced by the action of the German federal diet, which condemned Gutzkow to three months' imprisonment, decreed the suppression of all he had written or might yet write, and prohibited him from exercising the functions of editor within the German confederation. During his term of imprisonment at Mannheim, Gutzkow employed himself in the composition of his treatise Zur Philosophie der Geschichte (1836). On obtaining his freedom he returned to Frankfort, whence he went to Berlin. Here he inaugurated a new era of his literary activity by bringing out his tragedy _Richard Savage_ (1839), which immediately made the round of all the German theatres. Of his numerous other plays the majority are now neglected; but a few have obtained an established place in the repertory of the German theatre—especially the comedies _Zo£ und Schwert_ (1844), _Das Urbild des Tartüefe_ (1847), _Der Königstunent_ (1849) and the blank verse tragedy, _Uriel Acosta_ (1847). In 1847 Gutzkow went to Dresden, where he succeeded Tieck as literary adviser to the court theatre. Meanwhile he had not neglected the novel. _Seraphine_ (1838) was followed by _Blasendow und seine Söhne_, a satire on the educational theories of the time. Between 1850 and 1852 appeared _Die Ritter vom Geiste_, which may be regarded as the starting-point for the modern German social novel. _Der Zauberer von Rom_ is a powerful story of Roman Catholic life in southern Germany. The success of _Die Ritter vom Geiste_ suggested to Gutzkow the establishment of a journal on the model of Dicken's _Household Words_, entitled _Unterhaltsamen am häuslichen Herd_, which first appeared in 1852 and was continued till 1862. In 1864 he had an accident, and his productions show hereafter decided traces of failing powers. To this period belong the historical novels _Hohenschwangau_ (1868) and _Fritz Ellrodt_ (1872), _Lebensbilder_ (1870–1872), consisting of autobiographical sketches, and _Die Söhne Pestaloizis_ (1870), the plot of which is founded on the story of Kaspar Hauser. On account of a return of his nervous malady, Gutzkow in 1873 made a journey to Italy, and on his return took up his residence in the country near Heidelberg, whence he removed to Frankfort-on-Main, dying there on the 16th of December 1878. With the exception of one or two of his comedies, Gutzkow's writings have fallen into neglect. But he exerted a powerful influence on the opinions of modern Germany; and his works will always be of interest as the mirror in which the intellectual and social struggles of his time are best reflected.

An edition of Gutzkow's collected works appeared at Jena (1873–1876, new ed., 1879). E. Wolff has published critical editions of Gutzkow's _Meisterdramen_ (1892) and _Wally die Zweierfon_ (1895). His more important novels have been frequently reprinted. For Gutzkow's life see his various autobiographical writings such as _Aus der Knabenheit_ (1852), _Rückblische auf mein Leben_ (1870), &c. For an estimate of his life and work see _J. Pröbels, Das junge Deutsch- land_ (1893), also _H. H. Krämer, Über die Dramen Gutzkows_ (1898) and _Gutzkow-Funde_ (1901).

GÜTZLAF, KARL FRIEDRICH AUGUST (1803–1831), German missionary to China, was born at Pirzitz in Pomerania on the 8th of July 1803. When still apprenticed to a saddler in Stettin, he made known his missionary inclinations to the king of Prussia, through whom he went to the Pädagogium at Halle, and afterwards to the mission institute of Jäncke in Berlin. In 1826, under the auspices of the Netherlands Missionary Society, he went to Java, where he was able to learn Chinese. Leaving the society in 1828, he went to Singapore, and in August of the same year removed to Bangkok, where he translated the Bible into Siamese. In 1829 he married an English lady, who aided him in the preparation of a dictionary of Cochin Chinese, but she died in August 1831 before its completion. Shortly after her death he sailed to Macao in China, where, and subsequently at Hong Kong, he worked at a translation of the Bible into Chinese, published a Chinese monthly magazine, and wrote in Chinese various books on subjects of useful knowledge. In 1834 he published at London a _Journal of Three Voyages along the Coast of China_ in 1831, 1832 and 1833. He was appointed in 1835 joint Chinese secretary to the English commission, and during the years 1840-42 the negotiations connected with the peace that followed were rendered valuable service by his knowledge of the country and people. The Chinese authorities refusing to permit foreigners to penetrate into the interior, Gützlaff in 1844 founded an institute for training native missionaries, which was so successful that during the first four years as many as forty-eight Chinese were sent out from it to work among their fellow-countrymen. He died at Hong Kong on the 6th of August 1851.

Gützlaff also wrote of _Sketch of Chinese History, Ancient and Modern_ (London, 1834), and a similar work published in German at Stuttgart in 1847; _China Opened_ (1838); and the _Life of Tao-Kwang_ (1854; German edition published at Leipzig in 1857). A valuable collection of his Chinese writings is contained in the library at Munich.

GUY OF WARWICK, English hero of romance. Guy, son of Siward or Seguar of Wallingford, by his prowess in foreign wars wins in marriage Felice (the Phyllis of the well-known ballad), daughter and heiress of Roal, earl of Warwick. Soon after his marriage he is seized with remorse for the violence of his past life, and, by way of penance, leaves his wife and fortune to make a pilgrimage to the Holy Land. After years of absence he returns in time to deliver Winchester for King Ethelstan from the invading northern kings, Anelaph (Anlaf or Olaf) and Gonelaph, by slaying in single fight their champion the giant Colbrand. Local tradition fixes the duel at Hyde Mead near Winchester. Making his way to Warwick he becomes one of his wife's bedmen, and presently retires to a hermitage in Arden, only revealing his identity at the approach of death. The versions of the Middle English romance of Guy which we possess are adaptations from the French, and are cast in the form of a _romance_. In the _Tristan du Merlin_, or _Tristan of Guy's Wars_ in Lombardy, Germany and Constantinople, and embellished with fights with dragons and surprising feats of arms. The kernel of the tradition evidently lies in the fight with Colbrand, which represents, or at least is symbolic of an historical fact. The religious side of the legend finds parallels in the stories of St Eustachius and St Alexius; and makes it probable that the Guy-legend, as we have it, has passed through monastic hands. Tradition seems to be at fault in putting Guy's adventures under Ethelstan. The Anlaf of the story is probably Olaf Tryggvason, who, with Sweyn of Denmark, harried the southern counties of England in 993 and pitched his winter quarters in Southampton. Winchester was saved, however, not by the valour of an English champion, but by the payment of money. This Olaf was not unnaturally confused with Anlaf Cuanar or Havelok (q.v.).

The name Guy (perhaps a Norman form of A.S. wi^g = war) may be fairly connected with the family of Wigod, lord of Wallingford under Edward the Confessor, and a Friolica, who belongs to the 12th century and was perhaps the Norman poet's patron. This name occurs in the pedigree of the Ardans, descended from Thurkill of Warwick and his son Siward. Guy's Cliffe, near Warwick, where in the 14th century Richard de Beauchamp, earl of Warwick, erected a chantry, with a statue of the hero, does not correspond with the site of the hermitage as described in the

1 Some writers have supposed that the fight with Colbrand symbolizes the victory of Brunanburh. Anelaph and Gonelaph would then represent the cousins Anlaf Sihtrisol and Anlaf Godfreyson (see Havelok).

2 See the English legends in C. Horstmann, _Allgemeine Legenden. Neue Folge_ (Heilbronn, 1881).
romance. The bulk of the legend is obviously fiction, even though it may be vaguely connected with the family history of the Ardens and the Wallingford family, but it was accepted as authentic fact in the chronicle of Pierre de Langtoft (Peter of Langtoft) written at the end of the 13th century. The adventures of Reymbrun, son of Guy, and his tutor Heraud of Arden, who had also educated Guy, have much in common with his father’s history, and form an interpolation sometimes treated as a separate romance even in the present time. It has been given Guy the Brun in the Guide of Tours (I. 800), and Alcuin’s advice to the count is transferred to the English hero in the Speculum Gy de Wyarewe (c. 1327), edited for the Early English Text Society by G. L. Morrill, 1898.

The French romance (Brit. Mus. Harl. MS. 3775) has not been printed, but is described by Emile Littre in Histo. litt. de la France (xvii. 441-851, 1852). A French prose version was printed in Paris, 1525, and subsequently (see G. Brunet, Manuel du libr prove, s. v. “Guy de Varriane”); the English metrical romance exists in four versions, dating from the early 14th century; the text was edited by J. Zupitza (1875-1876) for the E.E.T.S. from Cambridge University Libr. Paper MS. Fc. 2, 38, and again (3 pts. 1883-1801, extra series, Nos. 42, 49, 59), from the Ashmole and Cains College MS. 104, the text of the last is shown by the numerous versions in English: Guy of Warwick, translated from the Latin of Girardus Cornubianus (8. 1350) into English verse by John Lydgate between 1342 and 1468; Guy of Warwick, a poem (written in 1617 and published posthumously in 1635) by A. P. North (Edin. Mus.) contains a sonnet by John Milton, father of the poet: The Famous Historie of Earl of Warwick (c. 1607), by Samuel Rowlands; The Book of the Est and Victorious Prince Guy of Warkhege (William Copley, 1606); late); other editions by J. Cawood and C. Bates; chaps- books and ballads of the 17th and 18th centuries: The Tragic History, Admireable Acheivements and Curious Events of Guy, Earl of Warwick, a tragedy (1661) which may possibly be identical with a play on the subject written by John Day and Thomas Dekker, and entered at Stationers’ Hall on the 15th of January 1618/19; three verse fragments are printed by Hales and Furnivall in their edition of the Percy Folio MS. vol. ii. of an early French MS. is described by J. A. Herbert (An Early MS. of Guy de Warwick, London, 1905). See also M. Weyrauch Die mittelengl. Fassungen des Sagan von Guy (2 pts. Breslau, 1899 and 1901); J. Zupitza in Sitzungsber. d. phil.-hist. Kl. d. kgl. Acad. d. Wiss. (vol. lxiv., Vienna, 1874), and Zur Literaturgeschichte des Guy von Warwick (Vienna, 1873); a learned discussion of the whole subject by H. L. Ward, Catalogue of Romances (I. 471-501, 1883); and an article by S. L. Lee in the Dictionary of National Biography.

GUY, THOMAS (1644-1724), founder of Guy’s Hospital, London, was the son of a lighterman and coal-dealer at South- wark. After serving an apprenticeship of eight years with a bookseller, he in 1668 began business on his own account. He dealt largely in novels, which he had for many years been printing and extemporaneously printed in London. These he at first imported from Holland, but subsequently obtained from the University of Oxford the privilege of printing. Thus, and by an extremely thrifty mode of life, and more particularly by investment in government securities, the subscription of these into the South Sea Company, and the subsequent sale of his stock in 1720, he became master of an immense fortune. He died unmarried on the 17th of December 1724. In 1707 he built three wards of St Thomas’s Hospital, which institution he otherwise successively supported; and at his death he endowed Guy’s Hospital, leaving for its endowment £219,490; he also endowed Christ’s Hospital with £400 a year, and in 1678 endowed almshouses at Tamworth, his mother’s birthplace, which was represented by him in parliament from 1665 to 1707. The residue of his estate, which went to distant relatives, amounted to about £30,000.

See A True Copy of the Last Will and Testament of Thomas Guy, Esq. (London, 1724), and of the Hospital of London, 1726, 1738, 1772); Nichols, Literary Anecdotes, iii. 599 (1812); Charles Knight, Shadows of the Old BookSELLERS, pp. 3-23 (1866); and A Biographical History of Guy’s Hospital, by S. Wilkes and G. T. Brown (London, 1903).

GUYON, JEANNE MARIE BOUVIER DE LA MOTHE (1648-1717), French quietist writer, was born at Montargis, where her family were persons of consequence, on the 13th of April 1648. If her somewhat hysterical autobiography may be trusted she was much neglected in her youth; most of her time was spent as a boarder in various convent schools. Here she went through all the religious experiences common to neurotic young women; these were turned in a definitely mystical direction by the duchesse de Béthune, daughter of the disgraced minister, Fouquet, who spent some years at Montargis after her father’s fall. In 1664 Jeanne Marie was married to a rich invalid of the name of Guyon, many years her senior, who died in 1671, leaving his widow with three small children and a considerable fortune. All through her unhappy married life the mystical attraction had grown steadily in violence; it now attached itself to a certain Father Lacombe, a Barnabite monk of weak character and unstable intellect. In 1681 she left her family and joined him; for five years the two rambled about together in Savoy and the south-east of France, spreading their mystical ideas. At last they excited the suspicion of the authorities; in 1686 Lacombe was recalled to Paris, put under surveillance, and finally sent to the Bastille in the autumn of 1687. He was presently transferred to the castle of Lourdes, where he developed softening of the brain and died in 1715. Meanwhile Madame Guyon had been arrested in January 1688, and been shut up in a convent as a suspected heretic. Thence she was delivered in the following year by her old friend, the duchesse de Béthune, who had returned from exile to become a power in the devout court-circle presided over by Madame de Maintenon. Before long Madame Guyon herself was introduced into this pious assemblage. Its members were far from critical; they were very ready to believe and to take on these, Madame Guyon’s bitterest critics hear witness to her charm of manner, her imposing appearance, and the force and eloquence with which she explained her mystical ideas. So much was Madame de Maintenon impressed, that she often invited Madame Guyon to give lectures at her girls’ school of St Cyr. But by far the greatest of her conquests was Fénéon, now a rising young director of consciences, much in favour with aristocratic ladies. Dissatisfied with the formalism of average Catholic piety, he was already thinking out a mystical theory of his own; and between 1665 and 1693 he corresponded regularly. Fénéon’s interest in Madame Guyon’s bitterest critics hear witness to her charm of manner, her imposing appearance, and the force and eloquence with which she explained her mystical ideas. been several times translated into English. See also the literature of the article on QUIETISM; and H. Delacroix, Études sur le mysticisme (Paris, 1908). (St. C.)

GUYON, RICHARD DEBAUFE (1803-1850), British soldier, general in the Hungarian revolutionary army and Turkish pasha, was born at Walcot, near Bath, in 1803. After receiving a military education in England and in Austria he entered the Hungarian regulars in 1823, in which he served until after his marriage with a daughter of Baron Spleny, a general officer in the imperial service. At the outbreak of the Hungarian War in 1848, he re-entered active service as an officer of the Hungarian Honvédé, and he won great distinction in the action of Sukoro (September 29, 1848) and the battle of Schwechat (October 30). He added to his reputation as a leader in various actions in the winter of 1848-1849, and after the battle of Kopolna was made a general officer. He served in important and sometimes independent commands to the end of the war, after which he escaped to Turkey. In 1852 he entered the service of the sultan. He was made a pasha and lieutenant-general without being required to change his faith, and rendered distinguished service in the campaign against the Russians in Asia Minor (1854-55). General Guyon died of choler at Scutari on the 12th of October 1856.

GUYOT, ARNOLD HENRY (1807-1884), Swiss-American geologist and geographer, was born at Boudevilliers, near Neuchâtel. His father, a member of a family of barons, studied at the college of Neuchâtel and in Germany, where he began a lifelong friendship with Louis Agassiz. He was professor of history and physical geography at the short-lived Neuchâtel “Academy” from 1839 to 1848, when he removed, at Agassiz’s instance, to the United States, settling in Cambridge, Massachusetts. For several years he was a lecturer for the Massachusetts State Board of Education, and he was professor of geology and physical geography at Princeton from 1854 until his death there on the 8th of February 1884. He ranked high as a geologist and meteorologist. As early as 1835, he undertook, at Agassiz’s suggestion, the study of glaciers, and was the first to announce, in a paper submitted to the Geological Society of France, certain important observations relating to glacial motion and structure. Among other things he noted the more rapid flow of the centre than of the sides, and the more rapid flow of the top than of the bottom of glaciers; described the laminated or “ribbed” structure of the glacial ice, and ascribed the movement of glaciers to a gradual molecular displacement rather than to a sliding of the ice mass as held by de Saussure. He subsequently collected important data concerning erratic bodies, studied meteorological phenomena, and was connected with the establishement of the United States Weather Bureau, and his Meteorological and Physical Tables (1852, revised ed. 1884) were long standard. His graded series of text-books and wall-maps were important aids in the extension and popularization of geological study in America. In addition to text-books, his principal publications were: Earth and Man, Lectures on Comparative Physical Geography in its Relation to the History of Mankind (translated by Professor C. C. Felton, 1849); A Memoir of Louis Agassiz (1853); and Croizic et d’acclimatation de la Légion de Modern Science (1854).

GUYOT, YVES (1843-19__), French politician and economist, was born at Dinant on the 6th of September 1843. Educated at Rennes, he took up the profession of journalism, coming to Paris in 1867. He was for a short period editor-in-chief of L’Indépendant du midi of Nîmes, but joined the staff of La Rápœt on its foundation, and worked subsequently on other journals. He took an active part in municipal life, and waged a keen campaign against the presence of police, for which he suffered six months’ imprisonment. He entered the chamber of deputies in 1883 as representative of the first arrondissement of Paris and was rapporteur général of the budget of 1888. He became minister of public works under the premiership of P. E. Tirard in 1889, retaining his portfolio in the cabinet of C. L. de Freycinet until 1892. Although of strong liberal views, he lost his seat in the election of 1893 owing to his militant attitude against socialism. An uncompromising free-trader, he published La Comédie protectionniste (1903; Eng. trans. The Comedy of Protection); La Science économique (1st ed. 1881; 3rd ed. 1907); La Poésie (1889); La Tyrannie socialiste (1913); and was translated into English, Le Conflit du travail et leur solution (1903); La Démocratie individualiste (1907).

GUYON DE MORVEAU, LEON BERNARD, BARON (1737-1816), French chemist, was born on the 4th of January 1737, at Dijon, where his father was professor of civil law at the university. As a boy he showed remarkable aptitude for practical mechanics, but on leaving school he studied law in the university of Dijon, and in his twenty-fourth year became advocate-general in the parlement of Dijon. This office he held till 1782. Devoting his leisure to the study of chemistry, he published his Diggessions academiques, in which he set forth his views on phlogiston, crystallization, &c., and two years later he established in his native town courses of lectures on materia medica, mineralogy and chemistry. An essay on chemical nomenclature, which he published in the Journal de physique for May 1782, was ultimately developed with the aid of A. L. Lavoisier, C. L. Berthollet and A. F. Fourcroy, into the Méthode d’une nomenclature chimique, published in 1787, the principles of which were widely adopted by chemists throughout Europe. Constantly in communication with the leaders of the French school, he became a convert to the anti-philosophic doctrine of Keil, and he published his reasons in the first volume of the section “Chymie, Pharmacie et Métallurgie” of the Encyclopédie méthodique (1786), the chemical articles in which were written by him, as well as some of those in the second volume (1792). In 1794 he was appointed to superintend the construction of balloons for military purposes, being known as the author of some aeronautical experiments carried out at Dijon some ten years previously. In 1791 he became a member of the Legislative Assembly, and in the following year of the National Convention, to which he was re-elected in 1795, but he retired from political life in 1797. In 1798 he acted as provisional director of the Polytechnic School, in the foundation of which he took an active part, and from 1800 to 1814 he held the appointment of master of the mint. In 1811 he was made a baron of the French Empire. He died in Paris on the 2nd of January 1816.

Besides being a diligent contributor to the scientific periodicals of his time, Guyon wrote in English, A monograph on the "Clingstone" (1804), a satirical poem entitled Le Rat iconoclaste, ou le Jésuite croqueté (1765); Discours publics et éloges (1775-1782); Plaidoyers sur plusieurs questions de droit (1785); and Traité des moyens de désinfecter les établissements publics (1801), describing the distempering powers of calcium chloride and of hydrochloric acid gas which he had successfully used at Dijon in 1773. With Hugues Maret (1726-1785) and Jean François Durande (d. 1794) he also published the Éléments de chimie théorique et pratique (1776-1777).

GUZMICS, IZIDOR (1786-1830), Hungarian theologian, was born on the 7th of April 1786 at Vámoss-Család, in the county of Sopron. At Sopron (Oedenburg) he was instructed in the art of poetry by Paul Horváth. In October 1803 he entered the Benedictine order, but left it in August of the following year, only again to assume the monastic garb on the 10th of November 1804. He was confessor of the monastery of Pannonhegy he applied himself to the study of Greek under Farkas Tóth and in 1812 he was sent to Pest to study theology. Here he read the best German and Hungarian authors, and took part in the editorialship of the Nemeti (National) Páterk, and in the translation of Johann Hübner’s Lexicon. On obtaining the degree of doctor of divinity in 1816, he returned to Pannonhegy, where he devoted himself to dogmatic theology and literature, and contributed largely to Hungarian periodicals. The most important of his theological works are: A kath. anyaszenyeségének hűbii tanlása (The Doctrinal Teaching of the Holy Catholic Church), and A kerestésznek világházai egyesültébről (On Religious Unity among Christians), both published at Pest in 1822; also a Latin treatise entitled Theologia Christiana fundamentalis et theologica dogmatica (4 vols., Győr, 1828-1832). His translation of
GWALIOR—GWADAR

Theocritus in hexameters was published in 1824. His versions of the *Odyssey* of Sophocles and of the *Iphigenia* of Euripides were rewarded by the Hungarian Academy, of which in 1838 he was elected honorary member. In 1832 he was appointed abbot of the wealthy Benedictine house at Bakonybél, a village in the county of Veszprém. There he built an asylum for 150 children, and founded a school of harmony and singing. He died on the 1st of September 1839.

GWADAR, a port on the Makran coast of Baluchistan, about 260 m. S.W. of Kutch. Pop. (1903), 4,350. In the last half of the 18th century it was handed over by the khan of Kalat to the sultan of Muscat, who still exercises sovereignty over the port, together with about 300 sq. m. of the adjoining country. It is a place of call for the steamers of the British India Navigation Company.

GWALIOR, a native state of India, in the Central India agency, by far the largest of the numerous principalities comprised in that area. It is the dominion of the Sindhia family. The state consists of two well-defined parts which may roughly be called the northern and the southern. The former is a compact mass of territory, bounded N. and N.W. by the Chambal river, which separates it from the British districts of Agra and Etawah, and the native states of Dholpur, Karauli and Jaipur of Rajputana; E. by the British districts of Jalaun, Jhansi, Lalitpur and Saugar; S. by the states of Bhopal, Tonk, Khichpur and Rajgarh; and W. by those of Jhalawar, Tonk and Kotah of Rajputana. The southern, or Malwa, portion is made up of detached or semi-detached districts, between which are inserted parts of other states, which again are divided up with each other in bewildering intricacy. The two portions together have a total area of 25,041 sq. m. Pop. (1901), 2,033,909, showing a decrease of 13% in the decade.

The state may be naturally divided into plain, plateau and hilly country. The plain country extends from the Chambal river in the extreme southwards for about 80 m., with a maximum width from east to west of about 120 m. This plain, though broken in its southern portion by low hills, has generally an elevation of only a few hundred feet above sea-level. In the summer season the climate is very hot, the shade temperature rising frequently to 115° F., but in the winter months (from November to February inclusive) it is usually temperate and for short periods extremely cold. The average rainfall is 30 in., but the period 1891-1901 was a decade of low rainfall, and distress was caused by famine. South of this tract there is a gradual ascent to the Central India plateau, and at Sipri the general level is 1,500 ft. above the sea. On this plateau lies the remainder of the state, with the exception of the small district of Amjhera in the extreme south. The elevation of this region gives it a moderate climate during the summer as compared with the plain country, while the winter is warmer and more equable. The average rainfall is 28 in. The remaining portion of the state, classified as hilly, comprises only the small district of Amjhera. This is known as the Bhi country, and lies among the Vindhya mountains with a mean elevation of about 1,800 ft. The rainfall averages 23 in. In the two years 1899 and 1900 the monsoon was very weak, the result being a severe famine which caused great mortality among the Bhi population. Of these three natural divisions the plateau possesses the most fertile soil, generally of the kind known as "black cotton," but the low-lying plain has the densest population. The state is watered by numerous rivers. The Nerbudda, flowing west, forms the southern boundary. The greater part of the drainage is discharged into the Chambal, which forms the north-western and northern and eastern boundary. The Sind, with its tributaries the Kuvari, Asar and Sankh, flows through the northern division. The chief products are wheat, millets, pulses of various kinds, maize, rice, linseed and other oil-seeds; poppy, yielding the Malwa opium; sugar-cane, cotton, tobacco, indigo, garlic, tumeric and ginger. About 60% of the population are employed in agricultural and only 15% in industrial occupations, the great majority of the latter being home workers. There is a leather factory at Morar; cotton-presses at Morena, Baghana and Ujjain; ginning factories at Agar, Nalkhera, Shajapur and Sonkach; and a cotton-mill at Ujjain. The cotton industry alone shows possibilities of considerable development, there being 55,000 persons engaged in it at the time of the census of 1901.

The population is composed of many elements, among which Brahmans and Rajputs are specially numerous. The prevailing religion is Hinduism, 84% of the people being Hindus and only 6% Mahomedans. The revenue of the state is about one million rupees; and large reserves have been accumulated, from which two millions were lent to the government of India in 1889, and later on another million for the construction of the Gwalior-Agra and Indore-Neemuch railways. The railways undertaken by the state are: (1) from Bina on the Indian Midland to Gogra; (2) an extension of this line to Baran, opened in 1899; (3) from Bhopal to Ujjain; (4) two light railways, from Gwalior to Sipri and Gwalior to Bhind, which were opened by the viceroy in November 1890. On the same occasion the viceroy opened the Victoria College, founded to commemorate the Diamond Jubilee, and the Memorial Hospital, built in memory of the maharaja's father. British currency has been introduced instead of Chandori rupees, which were much depreciated. The state maintains three regiments of Imperial Service cavalry, two battalions of infantry and a transport corps.

History.—The Sindhia family, the rulers of the Gwalior state, belong to the Mahtra nation and originally came from the neighbourhood of Poona. Their first appearance in Central India was early in the 18th century in the person of Ranoji (d. 1783), son of his successor, Mahadji. On his death his military abilities to command of his bodyguard. In 1776, together with Malhar Rao Holkar, the founder of the house of Indore, he was authorized by the peshwa to collect tribute (chauch) in the Malwa districts. He established his headquarters at Ujjain, which thus became the first capital of Sindhia's dominions.

Ranoji's son and successor, Jayapa Sindhia, was killed at Nagaur in 1759, and was in his turn succeeded by his son Jankoji Sindhia. But the real founder of the state of Gwalior was Mahadji Sindhia, a natural son of Ranoji, who, after narrowly escaping with his life from the terrible slaughter of Panipat in 1761 (when Jankoji was killed), obtained with some difficulty from the peshwa a re-grant of his father's possessions in Central India (1765). During the struggle which followed the death of Madhu Rao Peshwa in 1772 Mahadji seized every occasion for extending his power and possessions. In 1775, however, when Raghuba Peshwa threw himself on the protection of the British, the reverses which Mahadji encountered at their hands—(d. 1790)—were accepted by Major Popham as evidence of the weakness of the British army, and they decided to use their eyes to their power. By the treaty of Salbai (1783) it was agreed that Mahadji should withdraw to Ujjain, and the British retire north of the Jumna. Mahadji, who undertook to open negotiations with the other belligerents, was recognized as an independent ruler, and a British resident was established at his court. Mahadji, aided by the British policy of neutrality, now set to work to establish his supremacy over Hindustan proper. Realizing the superiority of European methods of warfare, he availed himself of the services of a Savoyard soldier of fortune, Benoît de Boigne, whose genius for military organization and command in the field was only instrumental in establishing the Mahtra power. Mahadji's disciplined troops made him invincible. In 1785 he re-established Shah Alam on the imperial throne at Delhi, and as his reward obtained for the peshwa the title of vākī-ul-mulāk or vicegerent of the empire, containing himself with that of his deputy. In 1788 he took advantage of the cruelties practised by Ghulam Kadir on Shah Alam, to occupy Delhi, where he established himself as the protector of the aged emperor. Though nominally a deputy of the peshwa he was now ruler of a vast territory, including the greater part of Central India and Hindustan proper, while his lieutenants exacted tribute from the chiefs of Rajputana. There can be no doubt that he looked with apprehension on the growing power of
the British; but he wisely avoided any serious collision with them.

Mahadji died in 1794, and was succeeded by his adopted son, Daulat Rao Sindia, a grandson of his brother Tukoji. When, during the period of unrest that followed the deposition of the peshwa, Mahadji Rao II., in 1795, and of Tukoji Holkar in 1796, the Mahatta leaders fought over the question of supremacy, the peshwa, Baji Rao II., the titular head of the Mahatta confederation, fled from his capital and placed himself under British protection by the treaty of Bassein (December 31, 1802). This interposition of the British government was resented by the confederacy, and it brought on the Mahatta War of 1803. In the campaign that followed a combined Mahatta army, in which Daulat Rao's troops furnished the largest contingent, was defeated by General Arthur Wellesley at Assaye and Argaum in Central India; and Lord Lake routed Daulat Rao's European-trained battalions in Northern India at Agra, Aligarh and Laswari. Daulat Rao was then compelled to sign the treaty of Sarji Anjangaon (December 30, 1803), which stripped him of his territories between the Jumna and Ganges, the district of Broach in Gujarat and other lands in the south. By the same treaty he was deprived of the forts of Gwalior and Gohad; but these were restored by Lord Cornwallis in 1805, when the Chambal river was made the northern boundary of the state. By a treaty signed at Burhanpur in 1803 Daulat Rao further agreed to the reduction of his military force, to the payment of the revenues of the territories ceded under the treaty of Sarji Anjangaon. When, however, in 1816 he was called upon to assist in the suppression of the Pindaris, though by the treaty of Gwalior (1879) he promised his co-operation, his conduct was so equivocal that in 1818 he was forced to sign a fresh treaty by which he ceded Ajmere and other lands.

Daulat Rao died without issue in 1827, and his widow, Baiza Bai (d. 1862), adopted Mukut Rao, a boy of eleven belonging to a distant branch of the family, who succeeded as Jankoji Rao Sindia. His brother was weak; the state was distracted by interminable palace intrigues and military mutinies, and affairs went from bad to worse when, in 1843, Jankoji Rao, who left no heir, was succeeded by another boy, adopted by his widow, Tara Bai, under the name of Jayaji Rao Sindia. The growth of turbulence and misrule now induced Lord Ellenborough to interpose, and a British force under Sir Hugh Gough advanced upon Gwalior (December 1843). The Mahatta troops were defeated simultaneously at Maharajpur and Punniar (December 29), with the result that the Gwalior government signed a treaty ceding territory with revenue sufficient to support a competent force and a contingent force to be stationed at the capital, and limiting the future strength of the Gwalior army, while a council of regency was appointed during the minority to act under the resident's advice. In 1857 the Gwalior contingent joined the mutineers; but the maharaja himself remained loyal to the British, and fled from his capital until the place was retaken and his authority restored by Sir Hugh Rose (Lord Stratnairn) on the 19th of June 1858. He was rewarded with the districts of Neemuch and Amjhera, but Gwalior fort was occupied by British troops and was only restored to his son in 1886 by Lord Dufferin. Jayaji Rao, who died in 1886, did much for the development of his state. He was created a G.C.S.I. in 1891, and subsequently became a counsellor of the empress, a G.C.B. and C.I.E.

His son, the maharaja, Madhava Rao Sindia, G.C.S.I., was born in 1877. During his minority the state was administered for eight years by a council of regency. He was entrusted with ruling powers in 1894, and in all respects continued the reforming policy of the council, while paying personal attention to every department, being a keen soldier, an energetic administrator, and fully alive to the responsibilities attaching to his position. He was created an honorary aide-de-camp to the king-emperor, and an honorary colonel in the British army. He went to China as an aide-de-camp to General Gascoyne in 1901, and provided the expedition with a hospital ship at his own expense, while his Imperial Service Transport Corps proved a useful auxiliary to the British army in the Chitral and Tirah expeditions.

The City of Gwalior is 76 m. by rail S. of Agra, and had a population in 1901 of 119,433. This total includes the new town of Lashkar or "the Camp" which is the modern capital of the state and old Gwalior. The old town has a threefold interest: first as a very ancient seat of Jain worship; secondly for its interesting palace architecture of the best Hindu period (1186-1516); and thirdly as an historic fortress. There are several remarkable Hindu temples within the fort. One, known as the Sas Bahu, is beautifully adorned with bas-reliefs. It was finished in A.D. 1093, and, though much dilapidated, still forms a most picturesque fragment. Another Jain temple has been used as a mosque. Another temple in the fortress of Gwalior is called the Tell-Mandir, or "Oilman's Temple." This building was originally dedicated to Vishnu, but afterwards converted to the worship of Siva. The most striking part of the Jain remains at Gwalior is a series of caves or rock-cut sculptures, excavated in the rock on all sides, and numbering nearly a hundred, great and small. Most of them are mere niches to contain statues, though some are cells that may have been originally intended for residences. One curious fact regarding them is that, according to inscriptions, they were all excavated within the short period of about thirty-three years, between 1441 and 1474. Some of the figures are of colossal size; one, for instance, is 57 ft. high, which is taller than any other in northern India.

The palace built by Man Singh (1486-1516) forms the most interesting part of the early Hindu work of his class in India. Another palace of even greater extent was added to it in 1516; both Jehangir and Shah Jahan added palaces to these two—the whole making a group of edifices unequalled for picturesqueness and interest by any of their class in Central India. Among the apartments in the palace was the celebrated chamber, named the Baradari, supported on 12 columns, and 45 ft. square, with a stone roof, forming one of the most beautiful palace-halls in the world. It was, besides, singularly interesting from the expedients to which the Hindu architect was forced to resort to imitate the vaulting of the Moslem Minors, the Moslem Minors, which had excited the admiration of the emperor Babur, probably little now remains. The fort of Gwalior, within which the above buildings are situated, stands on an isolated rock. The face is perpendicular and where the rock is naturally less precipitous it has been scarped. Its greatest length from north-east to south-west is a mile and a half, and the greatest breadth 900 yds. The rock attains its maximum height of 342 ft. at the northern end. A rampart, accessible by a steep road, and farther up by huge steps cut out of the rock, surrounds the fort. The citadel stands at the north-eastern corner of the enclosure, and 300 feet above a very picturesque appearance. The old town of Gwalior, which is of considerable size, but irregularly built, and extremely dirty, lies at the eastern base of the rock. It contains the tomb of Mahomed Ghaus, erected during the early part of Akbar's reign. The fort of Gwalior was traditionally built by one Surya Sen, the raja of the neighbouring country. In 1196 Gwalior was captured by Mahomed Ghor; it then passed into the hands of several chiefs until in 1559 Akbar gained possession of it, and made it a state prison for captives of rank. On the dismemberment of the Delhi empire, Gwalior was seized by the Jat rana of Gohad. Subsequently it was garrisoned by Sindia, however, which was wrested in 1780 by the forces of the East India Company, and to whom it was finally restored by the British in 1886. The modern town contains the palace of the chief, a college, a high school, a girls' school, a service school to train officials, a law school, hospitals for men and for women, a museum, print-mills, and a printing-press issuing a state gazette.

Gwalior Residency, an administrative unit in the Central India agency, comprises Gwalior state and eleven smaller states and estates. Its total area is 17,925 sq. m., and its population in 1901 was 2,187,612. Of the area, 17,020 sq. m. belong to Gwalior State, and the agency also includes the small states of Raghugarh, Khaniadhana, Paron, Garha, Umri and Bhadaura, with the Chhahra pargana of Tonk.

Gweedore, a hamlet and tourist resort of Co. Donegal, Ireland, on the Londonderry & Lough Swilly & Letterkenny
railway. The river Clady, running past the village from the Nacung Loughs, affords salmon and trout fishing. The fine surrounding scenery culminates to the east in the wild mountain Errigal (2466 ft.) at the upper end of the loughs. The place owes its popularity as a resort to Lord George Hill (d. 1879), who also laboured for the amelioration of the conditions of the peasantry.

GWILT, JOSEPH (1784–1863), English architect and writer, was the younger son of George Gwilt, architect surveyor to the county of Surrey, and was born at Southwark on the 11th of January 1784. He was educated at St Paul's school, and after a short course of instruction in his father's office was in 1801 admitted a student of the Royal Academy, where in the same year he gained the silver medal for his drawing of the tower and steeple of St Dunstan-in-the-East. In 1811 he published a Treatise on the Equilibrium of Arches, and in 1815 he was elected F.S.A. After a visit to Italy in 1816, he published in 1818 Notitia architectonica italiana, or Concise Notices of the Buildings and Architects of Italy. In 1825 he published an edition of Sir William Chambers's Treatise on Civil Architecture; and among his other principal contributions to the literature of his profession are a translation of the Architecture of Vitruvius (1826), a Treatise on the Rudiments of Architecture, Practical and Theoretical (1826), and his valuable Encyclopaedia of Architecture (1842), which was published with additions by Wyatt Papworth in 1867.

In recognition of Gwilt's advocacy of the importance to architects of a knowledge of mathematics, he was in 1833 elected a member of the Royal Astronomical Society. He took a special interest in philology and music, and was the author of Rudiments of the Anglo-Saxon Tongue (1839), and of the article 'Music' in the Encyclopaedia Britannica. His principal work as a practical architect were Markree Castle near Sligo in Ireland, and St Thomas's church at Charlton in Kent. He died on the 14th of September 1863.

GWYN, NELL [ELEANOR] (1650–1687), English actress, and mistress of Charles II., was born on the 2nd of February 1650/1, probably in an alley off Drury Lane, London, although Hereford also claims to have been her birthplace. Her father, Thomas Gwyn, appears to have been a broken-down soldier of a family of Welsh origin. Of her mother little is known save that she lived for some time with her daughter, and that in 1679 she was drowned, apparently when intoxicated, in a pond at Eton. Nell Gwyn, who sold oranges in the precincts of Drury Lane Theatre, passed, at the age of fifteen, to the boards, through the influence of the actor Charles Hart and of Robert Duncan or Dunigan, an officer of the guards who had interest with the management. Her first recorded appearance on the stage was in 1665 as Cydaria, Montecenza's daughter, in Dryden's Indian Emperor, a serious part ill-suited to her. In the following year she was Lady Wealthy in the Hon. James Howard's comedy The English Monstrue. Pepys was delighted with the playing of "pretty, witty Nell," but when he saw her as Florimel in Dryden's Secret Love, or the Maiden Queen, he wrote "so great a performance of a comical part was never, I believe, in the world before" and, "so done by Nell her merry part as cannot be better done in nature" (Diary, March 25, 1667). Her success brought her other leading roles—Bellario, in Beaumont and Fletcher's Philaster; Flora, in Rhodes's Flora's Vagaries; Samira, in Sir Robert Howard's Surprize; and she remained a member of the Drury Lane company until 1669, playing continuously save for a brief absence in the summer of 1667 when she lived at Epsom as the mistress of Lord Buckhurst, afterwards 6th earl of Dorset (q.v.). Her last appearance was as Almahide to the Almanzor of Hart, in Dryden's The Conquest of Granada (1679), the production of which had been postponed some months for her return to the stage after the birth of her first son by the king.

As an actress Nell Gwyn was largely indebted to Dryden, who seems to have made a special study of her airy, irresponsible personality, and who kept her supplied with parts which suited her. She excelled in the delivery of the risky prologues and epilogues which were the fashion, and the poet wrote for her some specially daring examples. It was, however, as the mistress of Charles II. that she endeared herself to the public. Partly, no doubt, her popularity was due to the disgust inspired by her rival, Louisa de Keroualle, duchess of Portsmouth, and to the fact that, while the Frenchwoman was a Catholic, she was a Protestant. But very largely it was the result of exactly those personal qualities that appealed to the monarch himself. She was piquante rather than pretty, short of stature, and her chief beauty was her reddish-brown hair. She was illiterate, and with difficulty scrawled an awkward E. G. at the bottom of her letters, written for her by others. But her frank recklessness, her generosity, her invariable good temper, her ready wit and infectious high spirits and amazing indiscretions appealed irresistibly to a generation which welcomed in her the living antithesis of Puritanism. "A true child of the London streets," she never pretended to be superior to what she was, nor to interfere in matters outside the special sphere assigned her; she made no ministers, she appointed to no bishoprics, and for the high issues of international politics she had no concern. She never forgot her old friends, and, as far as is known, remained faithful to her royal lover from the beginning of their intimacy to his death, and, after his death, to her memory.

Of her two sons by the king, the elder was created Baron Hedington and earl of Buryford and subsequently duke of St Albans; the younger, James, Lord Beauchlair, died in 1690, while still a boy. The king's death-bed request to his brother, "Let not poor Nelly starve," was faithfully carried out by James II., who paid her debts from the Secret Service fund, provided her with other moneys, and settled on her an estate with reversion to the duke of St Albans. But she did not long survive her lover's death. She died in November 1667, and was buried on the 17th of December in the church of St Martin-in-the-Fields, her funeral sermon being preached by the vicar, Thomas Tenison, afterwards archbishop of Canterbury, who said "much to her praise." Tradition credits the foundation of Chelsea Hospital to her influence over the king.

Hutt (1872); Memoirs of the Life of Eleanor Gwyn (1753); Burnet, History of My Own Time, part i., edited by Osmund Airy (Oxford, 1867); Louisa de Keroualle, Duchess of Portsmouth, by H. Forneron, translated by Mrs Crawford (1867).

GWYNIAD, the name given to a fish of the genus Coregonus or White fish (C. clupeoides), inhabiting the large lakes of North Wales and the north of England. At Llubon it is known by the name of "schelly," at Loch Lomond by that of "pown." It is tolerably abundant in Lake Bala, keeping to the deepest portion of the lake for the greater part of the year, appearing in shoals near the shores at certain seasons. It is well flavoured, like all the species of Coregonus, but scarcely attains to the weight of a pound. The name gwyniad is a Welsh word, and signifies "shining"; and it is singular that a similar fish in British Columbia, also belonging to the family of Salmonoids, is called by the natives "quinat," from the silvery lustre of its scales, the word having in their language the same meaning as the Welsh "gwyniad."

GYANTSE, one of the large towns of Tibet. It lies S.E. of Shigatse, 135 m. from the Indian frontier and 145 m. from Lhasa. Its central position at the junction of the roads from India and Bhutan with those from Ladakh and Central Asia leading to Lhasa makes it a considerable distributing trade centre. Its market is the third largest in Tibet, coming after Lhasa and Shigatse, and is especially celebrated for its woollen cloth and carpet manufactures. Here caravans come from Ladakh, Nepal and upper Tibet, bringing gold, borax, salt, wool, musk and furs, to exchange for tea, tobacco, sugar, cotton goods,
broadcloth and hardware. The town is compactly built of stone houses, with wooden balconies facing the main street, whence narrow lanes strike off into unlively subunits, and contains a fort and monastery. In the British expedition of 1904 Gyantze formed the first objective of the advance, and the siege was besieged here in the mission period of China for some time. The Tibetans carried back on the post, and were beaten off with some difficulty, but subsequently the British attacked and stormed the fort or Jong. Under the treaty of 1904 a British trade station is stationed at Gyantze.

GYGES, founder of the third or Mermnad dynasty of Lydia kings, he reigned 687–632 B.C. according to H. Glerz, 690–657 B.C. according to H. Winckler. The chronology of the Lydian kings given by Herodotus has been shown by the Assyrian inscriptions to be about twenty years in excess. Gyges, son of Dascylus, who, when recalled from banishment in Cappadocia by the Lydian king Sadyattes—called Candaules “the Dog-strangler” (a title of the Lydian Hermes) by the Greeks—sent his son back to Lydia instead of himself. Gyges soon became a favourite of Sadyattes and was despatched by him to fetch Tudo, the daughter of Arnomos of Myria, whom the Lydian king wished to make his queen. On the way Gyges fell in love with Tudo, who complained to Sadyattes of his conduct. Forewarned that the king intended to punish him with death, Gyges assassinated Sadyattes in the night and seized the throne with the help of Arnomos of Myria, the cause of the Carian war, who was his father-in-law to his cause. Civil war ensued, which was finally ended by an appeal to the oracle of Delphi and the confirmation of the right of Gyges to the crown by the Delphian god. Further to secure his title he married Tudo. Many legends were told among the Greeks about his rise to power. That found in Herodotus, which may be traced to the poet Archilochus of Paros, described how “Candaules” insisted upon showing Gyges his wife unrobed, which so enraged her that she gave Gyges the choice of murdering her husband and making himself king, or of being put to death by her. Gyges chose the latter and discovered a magic ring by means of which he murdered his master and won the affection of his wife (Hdt. i. 8–14; Plato, Rep. 359; Justin i. 7; Cicero, De offic. iii. 9). Once established on the throne Gyges devoted himself to consolidating his kingdom and making it a military power. The Troad was conquered, Colophon captured from the Greeks, Smyrna besieged and alliances entered into with Ephesus and Miletus. The Cimmeri, who had ravaged Asia Minor, were beaten back, and an embassy was sent to Assur-bani-pal at Nineveh (about 650 B.C.) in the hope of obtaining his help against the Carian war, although he was otherwise engaged, and Gyges turned to Egypt, sending his faithful Carian troops along with Ionian mercenaries to assist Psammetichus in shaking off the Assyrian yoke (660 B.C.). A few years later he fell in battle against the Cimmeri under Dugdammel (called Lygdamis by Strabo i. 3, 21), who took the lower town of Sardis. Gyges was succeeded by his son Aryds.

See Nicolaus Damascenus, quoted from the Lydian historian Xanthus, in C. Müller, Fragmenta historiarum Graecorum, II; R. Schubert, Geschichte der König von Lydien (1884); M. G. Radet, La Lydie et le monde grec au temps de Mermnades (1892–1893); H. Glerz, “Das Zeitalter des Gyges” (Rhth. Mus., 1875); H. Heiberg, Allertorialistische Forschungen, i. (1893), an edition of Herodotus. (A. H. S.)

GYLLIPUS, a Spartan general of the 5th century B.C.; he was the son of Cleandidas, who had been expelled from Sparta for accepting Athenian bribes (466 B.C.) and had settled at Thurii. His mother was probably a helot, for Gyllipus is said to have been, like Lyssander and Callicratidas, a motheach (see HELOT). When Alcibiades urged the Spartans to send a general to lead the Syracusans resistance against the Athenian expedition, Gyllipus was appointed, and his arrival was undoubtedly the turning point of the struggle (414–413). Though at first his long hair, his threadbare cloak and his staff furnished the subject of many a jest, and his harsh and overbearing manner caused grave discontent, yet the rapidity and decisiveness of his movements, won the sympathy and respect of the Syracusans. Diodorus (xiii. 28–32), probably following Timaeus, represents him as inducing the Syracusans to pass sentence of death on the captive Athenian generals, but we need have no hesitation in accepting the statement of Philistus (Plutarch, Nicia, 19) or Polyaenus (vii. 86), that he tried, though without success, to save their lives, wishing to take them to Sparta as a signal proof of his success. Gyllipus fell, as his father had done, through avarice; entrusted by Lysander with an immense sum which he was to deliver to the epors at Sparta, he could not resist the temptation to enrich himself and, on the discovery of his guilt, went into exile. Thucydides vi. 93, 104, vii.; Plutarch, Leuc. 17; H. L. Carf., 27, 28, Lysander 172, 28; Thukydides i. 39, 42. See SYRACUSUS (for the siege operations), commentaries on Thucydides and the Greek histories.

GYLLENSTJERN, THOMASINE CHRISTINE, BARONESS (1773–1856), Danish author, was born on the 9th of November 1773, at Copenhagen. Her maiden name was Buntzen. Her great beauty early attracted notice, and before she was seventeen she married the famous writer Peter Andreas Heiberg. To him she bore in the following year a son, afterwards illustrious as the poet and critic Johan Ludvig Heiberg. In 1800 her husband was exiled, and she obtained a divorce, marrying in December 1801 the Swedish Baron K. F. Ehrensvärd, himself a political fugitive. Her second husband, who presently adopted the name of Gylenstjerne, died in 1814. In 1822 she followed her son to Kiel, where he was appointed professor, and in 1825 she returned with him to Copenhagen. In 1827 she first appeared as an author by publishing her memoirs of her intimacy with Mora Family in her son’s newspaper Flyrende Post. In 1828 the same journal contained The Magic Ring, which was immediately followed by En Hvordsk historie (An Everyday Story). The success of this anonymous work was so great that the author adopted until the end of her career the name of “The Author of An Everyday Story.” In 1833–1834 she published three volumes of Old and New Novels. New Stories followed in 1835 and 1836. In 1839 appeared two novels, Montanaus the Younger and Ricidal; in 1840, One in All; in 1841, Near and Far; in 1843, A Correspondence; in 1844, The Cross Ways; in 1845, Two Generations. In 1836–1837 the Baroness Ehrensvärd-Gylenstjerne was engaged in bringing out a library edition of her collected works in twelve volumes. On the 2nd of July 1856 she died in her son’s house at Copenhagen. Not until then did the secret of her authorship transpire; for throughout her life she had preserved the closest reticence on the subject even with her nearest friends. The style of Madame Ehrensvärd-Gylenstjerne is clear and sparkling; for English readers no closer analogy can be found than between her and Mrs Gaskell, and Cranford might well have been written by the witty Danish author.

See L. Helberg, Peter Andreas Heiberg og Thomasine Gylenstjerne (Copenhagen, 1882), and L. Kornelliis-Hybel, Nogle Bemærkninger om P. A. Heiberg og Fru Gylenstjerne (Copenhagen, 1883).

GYLLENSTJERN, JOHAN, COUNT (1635–1684), Swedish statesman, completed his studies at Upsala and then visited most of the European states and laid the foundations of that deep insight into international politics which afterwards distinguished him. On his return home he met King Charles X. in the Danish islands and was in close attendance upon him till the monarch’s death in 1660. He began his political career at the diet which assembled in the autumn of the same year. An aristocrat by birth and inclination, he was nevertheless a true patriot and demanded the greatest sacrifices from his own order in the national interests. He was therefore one of those who laboured most zealously for the recovery of the crown lands. In the Upper House he was the spokesman of the gentry against the magnates, whose power he detested. He was at first curtailed in his parliamentary activity by his patron, P. A. Heiberg, and also by his gentry friends for his opposition to the crown. His adversaries vainly endeavoured to gain him by favour, as for court-marshal and senator he was still more hostile to the dominant patricians who followed the adventurous policy of Magnus de la Gardie. Thus he opposed the French alliance which de la Gardie carried through in 1672, and consistently advocated economy in domestic and neutrality in foreign affairs. On the outbreak of the war in 1675 he was the
GYMKHANA—GYMNASTICS AND GYMNASIUM

most loyal and energetic supporter of the young Charles XI., and finally his indispensable counsellor. Indeed, it may be said, that the political principles which he instilled into the youthful monarch were familiar to the then aged Charles during the whole of his reign. In 1669 Gyllenstierna was appointed the Swedish plenipotentiary at the peace congress of Lund. The alliance which he then concluded with Denmark bound the two northern realms together in a common foreign policy, and he sought besides to facilitate their harmonious co-operation by every means in his power. In 1680, after bringing home Charles XI.'s Danish bride from Copenhagen, he was appointed governor-general of Scania (Skåne), but expired a few weeks later.

See M. Hjörn, Överförs of Sveriges stjär politik under åren 1676–1680 (Stockholm, 1882, N. B.)

GYMKHANA, a display of miscellaneous sports, originally at the military stations of India. The word would seem to be a colloquial remodelling of the Hindustani gend-khana, ball-house or racquet-court, by substituting for gend the first syllable of the English word "gymnastics." The definition given in Yule's Glossary is as follows: "A place of public resort at a station, where the needful facilities for athletics and games . . . are provided." The name of the place was afterwards applied to the games themselves, and the word is now used almost exclusively by that meaning. In the Low Countries a similar place that can be traced was, on the authority of Major John Trotter, at Zutiki in the year 1861, when a gymkhana was instituted there. Gymkhana sports were invented to relieve the monotony of Indian station life, and both officers and men from the ranks took part in them. The first meetings consisted of promiscuous horse and pony races at catch weights. To these were soon added a second variety, originally called the pödölijk (funny races), the one generally known outside India, which consisted of miscellaneous races and competitions of all kinds, some serious and some amusing, on horseback, on foot and on bicycles. Among these may be mentioned the usual military sports; such as tent-pegging, lemon-cutting and obstacle racing; rickshaw racing; tilting at the ring, sack, pillon, hurdle, egg-and-spoon, blindfold, threading-the-needle and many other kinds of races depending upon the inventive powers of the committees in charge.

GYMNASTICS AND GYMNASIUM, terms signifying respectively a system of physical exercises practised either for recreation or for the purpose of promoting the health and development of the body, and the buildings where such exercises are carried on. The gymnasium of the Greeks was originally the school where competitors in the public games received their training, and was so named from the circumstance that these competitors exercised naked (γυμνάσκειν). The gymnasium was a public institution as distinguished from the palaestra, which was a private school where boys were trained in physical exercises, though the term palaestra is also often used for the part of a gymnasium specially devoted to wrestling and boxing. The athletic contests for which the gymnasium supplied the means of training and practice formed part of the social life of the Greeks from the earliest times. They were held in honour of heroes and gods; sometimes forming part of a periodic festival, sometimes of the funeral rites of a deceased chief. In course of time the Greeks grew more attached to such sports; their free active life, spent to a great extent in the open air, fostered the liking almost into a passion. The victor in any athletic contest, though he gained no money prize, was rewarded with the honour and respect of his fellow citizens; and a victory in the great religious festivals was counted an honour for the whole state. In these circumstances the training of competitors for the greater contests became a matter of public concern; and accordingly special buildings were provided by the state, and their management entrusted to public officials. The regulation of the gymnasium at Athens is attributed by Pausanias (i. 39. 3) to Theseus. Solon made several laws on the subject; but according to Galen it was reduced to a system in the time of Cleisthenes. Ten gymnastarchs, one from each tribe, were appointed annually. These performed in rotation the duties of their office, which were to maintain and pay the persons who were training for public contests, to conduct the games at the great Athenian festivals, to exercise general supervision over the morals of the youths, and to adorn and keep up the gymnasium. This office was of the highest importance, and great expense was entailed on the holders. Under them were ten sophronistae, whose duty was to watch the conduct of the youths at all times, and especially to be present at all their games. The practical teaching and selecting of the suitable exercises for each youth were in the hands of the pædagotribæ and gymnastæ, the latter of whom also superintended the effect on the constitution of the pupils, and prescribed for them when they were unwell. The alestæ, oiled and rubbed dust on the bodies of the youths, acted as surgeons, and administered the drugs prescribed.

The gymnasium was also the place of introduction to games and games of ball. The gymnasium built to suit these various purposes were large buildings, which contained not merely places for each kind of exercise, but also a stadium, baths, covered porticos for practice in bad weather, and outer porticos where the philosophers and men of letters read public lectures and held disputations.

The gymnasium of the Greeks did not long remain an institution exclusively devoted to athletic exercises. It soon began to be applied to other uses even more important. The development arose naturally through the recognition by the Greeks that physical culture was a necessary part of education under the influence of physical culture, and of the relation between exercise and health. The gymnasium accordingly became connected with education on the one hand and with medicine on the other. Due training of the body and maintenance of the health and strength of children were the chief part of earlier Greek education. Except the time devoted to letters and music, the education of boys was conducted in the gymnasium, where provision was made, as already mentioned, for their moral as well as their physical training. As they grew older, conversation and social intercourse took the place of the more systematic discipline. Philosophers and sophists assembled to talk and to lecture in the gymnasium, which thus became places of general resort for the purpose of all less systematic intellectual pursuits, as well as for physical exercises. In Athens there were three great public gymnasiums—Academy, Lyceum and Cynosarges—each of which was consecrated to a special deity with whose statue it was adorned; and each was rendered famous by association with a celebrated school of philosophy. Plato's teaching in the Academy has given immortality to that gymnasium; Aristotle held a lectureship on the Lyceum; and the Cynosarges was the resort of the Cynics. Plato when treating of education devotes much consideration to gymnastics (see especially Rep. iii. and various parts of Laws); and according to Plato it was the sophist Proclides who first pointed out the connexion between gymnastics and health. Having found such exercises beneficial to his own weak health, he formulated a method which was adopted generally, and which was improved by Hippocrates. Galen lays the greatest stress on the proper use of gymnastics, and throughout ancient medical writers we find that special exercises are prescribed as the cure for special diseases.

The Greek institution of the gymnasium never became popular with the Romans, who regarded the training of boys in gymnastics with contempt as conducive to idleness and immorality, and of little use from a military point of view; though at Sparta gymnastic training had been chiefly valued as encouraging warlike tastes and promoting the bodily strength needed for the use of weapons and the endurance of hardship. Among the Romans of the republic, the games in the Campus Martius, the duties of camp life, and the enforced marches and other hardships of actual warfare, served to take the place of the gymnastic exercises required by the Greeks. The first public gymnasium at Rome was built by Nero and another by Commodus. In the middle ages, though jousts and feats of horsemanship and field sports of various kinds were popular, the more systematic training of the body which the Greeks had associated with the gymnasium fell into neglect; while the therapeutic value of special exercises as understood by Hippocrates and Galen appears to have been lost sight of. Rousseau, in his Émile, was the first in modern times to call attention to the injurious consequences of such
indifference, and he insisted on the importance of physical culture as an essential part of education. It was probably due in some measure to his influence that F. L. Jahn and his followers in Germany, encouraged by the Prussian minister Stein, established the Tursplitte, or gymnastics schools, which played an important part in the War of Liberation, and in the political agitation which followed the establishment of the German confederation by the Congress of Vienna. The educational reformers Pestalozzi and Froebel emphasized the need for systematic physical training in any complete scheme of education.

The later development of the classical gymnasium (when it had become the school of intellectual culture rather than of exclusively physical exercise), and not the original idea, has been perpetuated in the modern use of the word in Germany, where the name "gymnasium" is given to the highest grade of the ordinary school, and the association of the word with athleticism has been entirely abandoned. On the other hand, in England, France and elsewhere in Europe, as well as in America, the history of the word has been precisely the reverse; the connection of the gymnasium with philosophy and mental culture has been dropped, and it indicates a building exclusively intended for the practice of physical exercises. But whereas the Greeks received training in the gymnasium for contests which are now designated as athletic sports (q.v.), gymnastics in the modern sense is a term restricted to such exercises as are usually practised indoors, such as gymnastics, tumbling, etc., and distinguished from sports or games practised in the open air.

It was not until near the end of the 19th century that gymnastics were recognized in England as anything more than a recreation; their value as a specifically therapeutic agent, or as an article in the curriculum of elementary schools, was not realized. More recently, however, educationists have urged with increasing insistence the need for systematic physical training, and their views received greater attention when evidence of deterioration in the physique of the people began to accumulate. During the course of the century a number of reports were made to parliament in England in favour of more systematic and general physical training being encouraged or even made compulsory by public authority. Voluntary associations were formed for encouraging such training and providing facilities for it. Gymnastics had already for several years been an essential part of the training of army recruits with exceedingly beneficial results, and gymnasias had been established at Aldershot and other military centres. Physical exercises, although not compulsory, obtained a permanent place in the code for elementary schools in Great Britain; and much credit has been taken for the fact that these exercises have had for the improvement of the physique of the children. These exercises are partly gymnastic and partly of the nature of drill; they do not in most cases require the use of appliances, and are on that account known as "free movements," which numbers of children go through together, accompanied whenever possible by music. On the other hand at the larger public schools and universities there are elaborate gymnasias equipped with a great variety of apparatus, the skilful use of which demands assiduous practice; and this is encouraged by annual contests between teams of gymnastic partisans at the great festivals.

The appliances vary to some extent in different gymnasias, some of the more complicated requiring a greater amount of space and involving a larger cost than is often practicable. But where these considerations are negligible, substantial uniformity is to be found in the equipment of gymnasias not designed for specifically medical purposes. The simplest, and in many respects the most generally useful, of all gymnastic apparatus is the dumb-bell. It was in use in England as early as the time of Elizabeth, and it has the advantage, with or without the assistance of mechanical appliances, of the individual strength of each learner, and can be adjusted in weight as his strength increases. The exercises that may be performed with the dumb-bell, combined with a few simple drill-like movements, give employment to all parts of the body and to both sides equally. Dumb-bell exercises, therefore, when arranged judiciously and with knowledge, are admirably suited for developing the physique, and are extensively employed in schools both for boys and girls. The bar-bell is merely a two-handed dumb-bell, and its use is similar in principle. The Indian club is also in use in most gymnasias; but the risk of overstraining the body by its unskilful handling makes it less generally popular than the dumb-bell. All these appliances may be, and often are, used either in ordinary schoolrooms or elsewhere outside the gymnasium. The usual fixed sorts of apparatus, the presence of which (or of some of them) in a building may be said to constitute it a gymnasium, are the following: a leaping-rove; a leaping-pole; a vaulting-horse; a horizontal bar, so mounted between two upright posts that its height from the ground may be adjusted as desired; parallel bars, used for exercises to develop the muscles of the trunk and arms; the trapeze consisting of a horizontal bar suspended by ropes at a height of 4 to 5 ft. from the ground; the bridge ladder; the plank; the inclined plane; the mast; swinging rings; the prepared wall; the horizontal beam.

Before the end of the 19th century the therapeutic value of gymnastics was fully realized by the medical profession; and a number of medical or surgical gymnasias came into existence, provided with specially devised apparatus for the treatment of different physical defects or weaknesses. The exercises practised in them are arranged upon scientific principles based on anatomical and physiological knowledge; and these principles have spread thence to influence largely the practice of gymnastics in schools and in the army. A French medical writer enumerates seven distinct groups of maladies, each including a number of different complaints, for which gymnastic exercises are a recognized form of treatment; and there are many malformations of the human body, formerly believed to be incurable, which are capable of being greatly remedied if not entirely corrected by regular gymnastic exercises practised under medical direction.

The value of gymnastics both for curing defects, and still more for promoting health and the development of normal physique, is recognized even more clearly on the continent of Europe than in Great Britain. In Germany the government not only controls the practice of gymnastics but makes it compulsory for every child and adult to undergo a prescribed amount of such physical training. In France also, physical training by gymnastics is under state control; in Sweden, Denmark, Switzerland, Italy, Russia, systems more or less distinct enjoy a wide popularity; and in Finland gymnastics are practised on lines that exhibit national peculiarities. The Finns introduced gymnastics in their veterinary schools and establishments as early as 1849. They also made use of gymnastics as a substitute for military training; and gymnastics is now considered as necessary to all branches of the army, as well as into the appliances devised to assist them; women are scarcely less expert than men in the performance of them; and this enthusiasm with which the system is supported produces the most beneficial results in the physique of the people. International gymnastic contests have become a feature of the revived Olympic Games (see Athletic Sports), and in those held at Athens in 1906 a team of Danish ladies took part in the competition and proved by their skilful performance that gymnastics may be practised with as much success by women as by men.

The chief work of the ancient gymnastics is Krause, Gymnastik und Agonistik der Hellenen (1841); of more recent works mention may be made of Jäger, Gymnastik der Hellenen (1881); L. Graescher, Erziehung und Unterricht im klassischen Altertum (1881); J. P. Mahaffy, Old Greek Education (1881); A. S. Wilkins, National Education in Greece (1873); E. Paz, Histoire de la gymnastique (1886); Wickenhagen, Antike und moderne Gymnastik (1891); Becker-Goll, Charles II.; Brugmans, Gymnastarium sive Graecos descriptio (1852); Petersen, Der Gymnastik der Griechen (1852). See also N. Lainson, Gymnastique pratique (Paris, 1870); Collin de La Gymnastique (Paris, 1884); L'Hygiène de l'école (Paris, 1889); P. de Coubertin, La Gymnastique moderne (Paris, 1905); and E. Findlay, Home Gymnastics (Boston, 1903). (R. J. M.)

GYMNOSOPHISTS (Lat., gymnosophiæ, from Gr. γυμνός, σοφός, "naked philosophers"), the name given by the Greeks to certain ancient Hindu philosophers who pursued asceticism to the point of regarding food and clothing as detrimental to purity of thought. From the fact that they often
GYMNOSPERMS

lived as hermits in forests, the Greeks also called them *Hyloboi* (of the *Vana-prashāh* in Sanskrit writings). Diogenes Laërtius (ix. 61 and 63) refers to them, and asserts that Pyrrho of Elis, the founder of pure scepticism, came under their influence, and on his return to Elis imitated their habits of life, to what extent does not appear. Strabo (xv. 711, 714) divides them into Brahmans and Sarmans (or Shams). See Jains.

**GYMNOSPERMS**, in Botany. The Gymnosperms, with the Angiosperms, constitute the existing groups of seed-bearing plants or Phanerogams: the importance of the seed as a distinguishing feature in the plant kingdom may be emphasized by the fact that the designation Spermatophyta for these two groups, in contrast to the Pteridophyta and Bryophyta in which true seeds are unknown. Recent discoveries have, however, established the fact that there existed in the Palaeozoic era fern-like plants which produced true seeds of a highly specialized type; this group, for which Oliver and Scott proposed the term Pteridospermae in 1904, must also be included in the Spermatophyta. Another instance of the production of seeds in an extinct plant which further reduces the importance of this character as a distinguishing feature is afforded by the Palaealoe, genus of plants of the sub-class Lycopodiales two of which possessed sporangia, which as long as 30 millimetres in length, are illustrated in the *New Phytologist* (vol. iv., p. 337). As Sachs says in his history of botany, “no more important discovery was ever made in the domain of comparative morphology and systematic botany.” As Coulter and Chamberlain express it, “the habitats of the Gymnosperms to-day indicate that they either are not at home in the more genial conditions affected by Angiosperms, or have not been able to maintain themselves in competition with this group of plants.”

These naked-seeded plants are of special interest on account of their great antiquity, which far exceeds that of the Angiosperms, and as comprising different types which carry us back to the Palaeozoic era and to the forests of the coal period. The best known and by far the largest division of the Gymnosperms is that of the cone-bearing trees (pines, firs, cedars, larches, &c.), which play a prominent part in the vegetation of the present day, especially in the higher latitudes of the northern hemisphere; certain members of this class are of considerable antiquity, but the conifers as a whole are still vigorous and show but little sign of decadence. The division known as the Cycadophyta is represented by a few living genera of limited geographical range and by a large number of extinct types which in the Mesozoic era (see *Palaeobotany*: *Mesozoic*) played a conspicuous part in the vegetation of the world. Among existing Cycadophyta we find surviving types which, in their present isolation, their close resemblance to fossil forms, and in certain morphological features, constitute links with the past that not only connect the present with former periods in the earth’s history, but serve as sign-posts pointing the way back along one of the many lines which evolution has followed.

It is needless to discuss at length the origin of the Gymnosperms. The two views which find most favour in regard to the Coniferales and Cycadophyta are: (1) that both have been derived from remote filicinaceous ancestors; (2) that the cycads are the descendants of a fern-like stock, while conifers have been evolved from lycopodiacine ancestors. The line of descent of recent cycads is comparatively clear in so far as they have undoubted affinity with Palaeozoic plants which combined cycadaceous and filicinaceous features; but opinion is much more divided as to the nature of the phylum from which the conifers are derived. The Cordaitales (see *Palaeobotany*: *Palaeozoe*) are represented by extinct forms only, which occupied a prominent position in the Palaeozoic period; these plants exhibit certain features in common with the living Araucarias, and others which invite a comparison with the maidenhair tree (*Ginkgo biloba*), the solitary survivor of another class of Gymnosperms, the Ginkgoales (see *Palaeobotany*: *Mesozoic*). The Gnetales are a class apart, including three living genera, of which we know next to nothing as regards their past history or line of descent. Although there are several morphological features in the three genera of Gnetales which might seem to bring them into line with the Angiosperms, it is usual to regard these resemblances as parallel developments along distinct lines rather than to interpret them as evidence of direct relationship.

**Gymnospermae.—**Trees or shrubs; leaves vary considerably in size and form. Flowers unisexual, except in a few cases (Gnetales) without a perianth. Monoeocious or dioecious. Ovules naked, rarely without carpellary leaves, usually borne on carpophylls, which assume various forms. The single megasporangiole embedded in the nucellus is filled with tissue (prothallus) before fertilization, and contains two or more archegonia, consisting usually of a large egg-cell and a small neck-cell, rarely of an egg-cell only and no neck (*Gnetum* and *Welwitschia*). Microspore spherical or oval, with or without a blader-like extension of the exine, containing a prothallus of two or more cells, one of which produces two non-motile or motile male (see *Palaeobotany*: *Palaeozoic*). I. *Pteridospermae* (see *Palaeobotany*: *Palaeozoe*).

II. *Cycadophyta.*

A. *Cycadales* (recent and extinct).

B. *Bennettitalea* (see *Palaeobotany*: *Mesozoic*).

III. *Cordaitales* (see *Palaeobotany*: *Palaeozoic*).

IV. *Ginkgoales* (recent and extinct).

V. *Coniferales*.

A. *Taxaceae*.

B. *Pinaceae*.

There is no doubt that the result of recent research and of work now in progress will be to modify considerably the grouping of the family *Gnetaceae*. Several genera, such as *Araucaria* and *Agathis*, should perhaps be separated as a special class and a re-arrangement of other genera more in accord with a natural system of classification will soon be possible; but for the present its twofold subdivision may be retained.

VI. *Gnetales*.

A. *Ephedriaceae*.

B. *Gnetaceae*.

C. *Welwitschiaceae* (Turbinoideae).

**Cycadophyta.—**A. *Cycadales*—Stems tuborous or columnar, not infrequently branched, rarely ephiphytic (Peruvian species of *Zamia*); leaves pinnate, bi-pinnate or entire. The Australian genus *Bunya*; Dioecious; flowers in the form of cones, except the female flowers of *Cycas*, which consist of a rosette of leaf-like carpels at the apex of the stem. Seeds albuminous, with one integument; the single embryo, usually bearing two partially fused cotyledons, is attached to a long terminal suspensor. Stems and roots increase in diameter by secondary thickening, the secondary wood being produced by one cambium or divided into two or more successive rings.

The cycads constitute a homogeneous group of a few living members confined to tropical and sub-tropical regions. As a fairly typical and well-known example of the Cycadaeae, a species of the genus *Cycas* (e.g. *C. circinalis*, *C. revoluta*, &c.) is briefly described. The stout columnar stem may reach a height of 20 metres, and a diameter of half a metre; it remains uncorked or branches or divides near the summit into several short and thick branches, each branch terminating in a crown of long pinnate leaves. The under surface of the stem is covered with rhomboidal areas, which represent the persistent bases of foliage- and scale-leaves. In some species of *Cycas* there is a well-marked alternation of transverse zones on the stem, consisting of larger areas representing foliage-leaf bases, and smaller but smaller areas representing the bases of scale-leaves (*F* and *S*, fig. 1). The scale-leaves clothed the terminal bud are linear-lanceolate in form, and of a brown or yellow colour; they are pushed aside as the stem-axis elongates and becomes shrunken, finally falling off, leaving projecting bases which are eventually cut off at a point or not.

**Fig. 1.—**Stem of *Cycas circinalis*. *F*, foliage-leaf bases; *S*, scale-leaf bases.
The young leaves of *Cycas* consist of a straight rachis bearing numerous linear pinnate, traversed by a single midrib; the pinnate are cinerately coiled like the leaf of a fern (fig. 3). The male flower of *Cycas* conforms to the type of structure characteristic of the cycads, and consists of a long cone of numerous sporophylls bearing small ovate scale-sacs on their lower faces. The type described serves as a convenient representative of its class. There are eight other living genera, which may be classified as follows—

**Classification.**—A. **Cycadeae.**—Characterized by (a) the alternation of scale- and foliage-leaves (fig. 1) on the branch or unbranched stem; (b) the growth of the main stem through the female flower; (c) the structure of the female flower, which is peculiar in not having the form of a cone, but consists of numerous independent carpels, each of which bears two or more lateral ovules. Represented by a single genus, *Cycas*. (Tropical Asia, Australia, &c.).

B. **Zamieae.**—The stem does not grow through the female flower; both male and female flowers are in the form of cones. (a) *Stangeria*.—Characterized by the fern-like venation of the pinnate, which have a prominent midrib, giving off at a wide angle simple or forked and occasionally anastomosing lateral veins. A single genus, *Stangeria*, confined to South Africa. (b) *Esowume*.—The pinnate are traversed by several parallel veins, an Australian cycad, as peculiar in having bi-pinnate fronds (fig. 5). The various genera are distinguished from one another by the shape and mode of attachment of the pinnate, the form of the carpel-like scales, and to some extent by anatomical characters. *Encephalartos* (South and Tropical Africa).—Large cones; the carpellary scales terminate in a peltate distal expansion. *Macrozamia* (Australia).—Similar to *Encephalartos* except in the presence of a spinous projection from the swollen distal end of the carpels. *Zamia* (South America, Florida, &c.).—Stem short and often divided into several columnar branches. Each carpel terminates in a peltate head. Ceratozamia (Mexico).—Similar to *Macrozamia*, but distinguished by the presence of two horn-like Young Frond, spinous processes on the apex of the carpels. *Microcycas* (Cuba).—Like *Zamia*, except that the ends of the staminal branch, which are the apices of the carpels are peltate. *Dioon* (Mexico) (fig. 4).—Characterized by the woolly scale-leaves and carpels; the latter terminate in a thick laminar expansion of triangular form, bearing two placental cushions, on which the ovules are situated. *Bowenia* (Australia).—Bi-pinnate fronds; stem short and tuberous (fig. 5).

The stems of cycads are often described as unbranched; it is true that in comparison with conifers, in which the number of branches from the main stem is limited, a characteristic form to the tree, the tuberous or columnar stem of the *Cycadaceae* constitutes a striking distinguishing feature. Branching, however, occurs not infrequently; in *Cycas* the tall stem often produces several candelabra-like arms; in *Zamia* the main axis may break up near the base into several cylindrical branches; in species of *Dioon* (fig. 4) lateral branches are occasionally produced. The South African *Encephalartos* frequently produces several branches. Probably the oldest example of this genus in cultivation is in the Botanic Garden of Amsterdam, its age is considered by Professor de Vries to be about two thousand years; although an accurate determination of age is impossible, there is no doubt that many cycads grow very slowly and are remarkable for longevity. The thick armour of petiole-bases developing the stem is a characteristic *Cycadean* feature; in *Cycas* the alternation of scale-leaves and fronds is more clearly shown than in other cycads; in *Encephalartos*, *Dioon*, &c., the persistent scale-leaves are almost equal in size to those of the foliage-leaves, and there is no regular alternation of zones such as characterizes some species of *Cycas*. Another type of stem is illustrated by *Stangeria* and *Zamia*, also by a few forms of *Cycas* (fig. 2), in which the fronds fall off completely, leaving a comparatively smooth stem. The *Cycas* type of frond, except as regards the presence of a midrib in each pinna, characterizes cycads generally except *Bowenia* and *Stangeria*. In the monotypic genus *Bowenia* the large fronds, borne singly on the short and thick stem, are bi-pinnate (fig. 5); the segments, which are broadly ovate or rhomboidal, have several forked spreading veins, and resemble the large pinnules of some species of *Adiantum*. In *Stangeria*, also a genus represented by one species (S. paradicea of South Africa), the long and comparatively broad pinnae, with an entire or irregularly lobed margin, have a nearly fern-like, a circumstance which led Kunze to describe the plant in 1835 as a species of the fern *Lamaria*. In rare cases the pinnae of cycads are lobed or branched; in *Dioon* *spinosum* (Central America) the margin of the segments bears numerous spinous processes; in some species of *Encephalartos*, e.g., *E. horridus*, the lamina is deeply forked, lobed; and in a species of the Australian genus *Macrozamia*, *M. heteromera*, the narrow pinnae are dichotomously branched almost to the base (fig. 6), and resemble the frond of some species of the fern *Schizaea*, or the fossil genus *Bolera* (Ginkgoales). An interesting species of *Cycas*, *C. micholitii*, has recently been described by Sir William Thistlethwaite-Dyer from Annam, where it was collected by one of Messrs Sanders & Son's collectors, in which the pinnae instead of being of the usual simple type are
GYMNOSPERMS

The pollination of pollen grains in gymnosperms is a critical event in their reproduction. In Ceratozamia, a broad petiole-base is characterized by the presence of two layers. The structure of pollination in gymnosperms is fascinating, and the pollen grains are shed in large numbers, often in clusters.

The ovule of a gymnosperm is a complex structure, consisting of the ovary, ovule, and the ovulate sac. The ovary contains the ovule, which develops into the seed. In the ovule, the pollen grain is the male gamete, which contains the sperm cells. The ovule is surrounded by the integuments, which are layers of tissue that protect the ovule from environmental stresses.

The development of seeds in gymnosperms is a unique process. The ovule, after fertilization, develops into a seed. The seed contains a embryo, which is the beginning of a new plant. The seed also contains food reserves, which are essential for the growth of the embryo. The seed is dispersed by various means, such as wind, water, or animals.

In gymnosperms, the seed is an important reproductive structure. The seed can be dispersed over long distances, and this allows the plant to reproduce in a range of environments. The seed is also a storage structure, containing food reserves that are needed for the growth of the embryo.

The anatomy of the seed is complex, and it contains various layers, such as the seed coat, testa, and endosperm. The seed coat is the outermost layer, and it protects the seed from environmental stresses. The testa is a layer of tissue that surrounds the seed coat, and it is often tough and resistant. The endosperm is a layer of food reserve tissue, which is essential for the growth of the embryo.

In summary, the pollination and seed development in gymnosperms are critical processes for their reproduction. The seed is an important reproductive structure, and it is adapted to various environments, allowing for a wide range of habitats.

GYMNOSPERMS

757

pits on the radial walls. The large medullary rays give to the wood a characteristic parenchymatous or lax appearance, which is in marked contrast to the more compact wood of a conifer. The protoxylem-elements are situated in the inner zone of the secondary wood, and may occur as small groups of narrow, spirally-pitted elements scattered among the parenchyma which abuts on the main mass of wood. Short and reticulately-pitted tracheal cells, similar to tracheids, often occur in groups of 2 or 3 in the cambial zone of coniferous stems. In an old stem of *Cycas, Encephalartos* or *Macrozamia* the secondary wood consists of several radius of small, unevenly thick-walled fibres, a second cambium is developed in the pericycle; this produces a second vascular zone, which is in turn followed by a third cambium, and so on, until several hollow cylinders are developed. It has been recently shown that several cambium-zones may be active at the same time, so that the formation of a new cambium does not necessarily mark a cessation of growth in the region. When the cambial zone undergoes a change, it occasionally happens that groups of xylem and phloem are developed internally to some of the vascular rings; these are characterized by an inverse orientation of the tissues, the xylem being centrifugal and the phloem centripetal in its development (fig. 9). This phenomenon of the leaf-bundles is met with in a less pronounced form in the flower peduncles of some cycads. This fact is of interest from the point of view of the comparison of recent cycads and gymnosperms. It is due to the presence of a protophloem and protoxylem-group, and is characterized by a broad pericyclic zone. A common phenomenon in cycads is the production of roots which grow upwards (apogeotropic), and appear as coralline branched structures above the level of the ground. Of the numerous forms of leaf-bundle structure of the gymnosperms, some are hypercyclic and contain numerous filaments of blue-green algae (Nostocaceae), which live as endoparasites in the cell-cavities.

**Ginkgoales.**—This class-designation has been recently proposed to give emphasis to the isolated position of the genus *Ginkgo* (Ginkospermia) among the Gymnosperms. *Ginkgo biloba*, the maiden-hair tree, has usually been placed by botanists in the Taxaceae in the class of coniferous trees, but the proposal by Eichler in 1852 to institute a special family, the *Salisburiae*, indicated a recognition of the existence of special characteristics which distinguish the genus from other members of the Coniferales. The classification of the Japanese Ginkgo, with the American *G. biloba* of the development of ciliated spermatozooids in the pollen-tube of *Ginkgo*, in place of the non-motile male cells of typical conifers, served as a cogent argument in favour of separating the genus from the Coniferales and placing it in a class of its own. In 1712 Kaempfer published a drawing of a Japanese tree, which he described under the name *Ginkgo*; this term was adopted in 1771 by Linnaeus, who spoke of Kaempfer's plant as *Ginkgo biloba*. Smith proposed to use the name *Salisburia adiantifolia* in preference to the "unnatural" genus *Ginkgo* (fig. 91), and to give the "correct" specific term *biloba*. Both names are still in common use. On the basis of a collateral section, in which the leaf-traces on the stele of the stem (fig. 9), spread right and left through the cortex of the stem (fig. 91, D), and as they curve gradually towards the vascular ring they present the appearance of two rather flattened curves, usually spoken of as the leaf-trace girdles (fig. 91, D). This discovery led to the name "Ginkgo" for the genus. *Ginkgo* is of special interest in account of its isolated position among existing plants, its restricted geographical distribution, and, its great antiquity (see PALAEOBOTANY: Mesosoric).*

**Ginkgo biloba.** The leaves of *Ginkgo biloba* are long, slender petioles terminating in a fan-shaped lamina, which may be entire, divided by a median incision into two wedge-shaped lobes, or subdivided into several narrow segments. The ovary is a slender, unilocular structure, with long shoots of unlimited growth, or at the apex of short shoots (spurs), which may eventually elongate into long shoots.

GYMNOSPERMS

The flowers are dioecious. The male flowers (fig. 12), borne in the axil of scale-leaves, consist of a stalked central axis bearing loosely spirally arranged male flowers (fig. 14, B). Each male flower consists of a stalked, scaly, nucellate, ovary, the apex of which projects from the megasporangium, the male flowers being referred to as a second integument or arillus, or as the representative of a carpel. The evidence afforded by normal and abnormal flowers appears to be in favour of the following interpretation: The peduncle is a shoot bearing two or more carpels. Each ovule is enclosed at the base by an envelope or nucellus, the latter forming the inner face of the woody shell, and, as in cycadean seeds, the apical portion is readily separated as a cap covering the summit of the endosperm. The morphology of the female flowers has been variously interpreted. The ovule is long and narrow, and the integuments are described as homologous with the petiole of a foliage-leaf and as a shoot-structure, the collar-like envelope at the base of the ovules being referred to as a second integument or arillus, or as the representative of a carpel. The evidence afforded by normal and abnormal flowers appears to be in favour of the following interpretation: The peduncle is a shoot bearing two or more carpels. Each ovule is enclosed at the base by an envelope or nucellus, the latter forming the inner face of the woody shell, and, as in cycadean seeds, the apical portion is readily separated as a cap covering the summit of the endosperm.

In order to avoid confusion in the term Coniferae, we may adopt as a class-designation the name Coniferales, including both the Coniferae—using the term in a restricted sense—and the Taxaceae.

The Monocotyledons and Dicotyledons have a common trunk and do not possess any seed-leaf as in Gymnospermae. The coniferous tree is characterized by its shoot, branch, and branchlet, and the regular manner of the monopodial branching and the pyramidal shape. Ararucaria imbricata, the Monkey-puzzle tree, A. excelsa, the New Zealand pine, and several other genera possess cone-like structures which illustrate the pyramidal form. The mammoth redwood tree of California, Sequoia (Wellingtonia) gigantea, which represents the tallest Gymnosperm, is a good example of the regular tapering main stem and horizontal branches, with terminal cones and branchlets, by narrow and narrow trees similar in habit to Lombardy poplars. The common cypress (Cupressus sempervirens), as found wild in the mountains of Greece and Crete, is also characteristic of the coniferous genera, which gives it a cedar-like habit. A pendulous or weeping habit is assumed by some conifers, e.g. Picea excelsa var. virginiana, in a form in which the main branches attain a considerable horizontal extension. The yew-hedge (Taxus baccata) of the species of Pinus, the yews (Taxus) and some other genera grow as bushes, in which there are not only several-repeated-branches bearing shoots. The infertile coniferous conditions in Arctic regions have produced a dwarf swarm, in which the main shoots grow close to the ground. Artificially induced dwarfed plants of Pinus, Cupressus, Sciadopitys (umbrella pine) and other genera are commonly cultivated by the Japanese. The dying off of older branches and the vigorous growth of shoots nearer the apex of the stem produce a form of tree illustrated by the stone pine of the Mediterranean region (Pinus pinea), which Turner has rendered famous by his description of the rapid growth of the Styrian kestrel's nest on it, which he has described in Italian scenery.

Conifers are not infrequently seen in which a lateral branch has bent sharply upwards to take the place of the injured main stem. This is not common in the Pinaceae or other coniferous genera, and is, as is well known, common in some species, producing well-marked varieties, e.g. Cephalotaxus fortunei var. fastigiata; this fastigate habit may arise as a sport on a tree with spreading branches. Amongst the coniferous genera the norit disease (a form of artificial budding) in which the shoot consists of a spindle-like shoot persisting in the adult tree; the numerous coniferous plants known as species of Retinospora are examples of this interesting habit. In some cases, e.g. Cupressus sempervirens, a sport arises in the trunk, as is well known, from which the Kauri pine of New Zealand, is the deciduous habit of the branches; these become detached from the main trunk leaving a well-defined albsce-surface, which appears as a depressed circular scar on the stem. A new genus of conifers, Taiwania, has recently been described from the island of Formosa; it is said to agree in habit with the Japanese Cryptomeria, but the cones appear to have a staminal column similar to that of the Ararucarias described any other genus.

With a few exceptions conifers are evergreen, and retain the leaves for several years (10 years in Ararucaria imbricata, 8 to 10 in Picea excelsa, 20 or more years in Sciadopitys and the northern species of Pinus. the northern species of Pinus may fall in October of their third year). The larch (Larix) in its leaves in the autumn, in the Chinese larch (Pseudolaris Kaempferi) the leaves turn a bright yellow colour before falling, whereas in Cupressus and Chamaecyparis assumes a rich brown colour in the autumn, and sheds its leaves together with the branches which bear them; deciduous branches occur also in some other species, e.g. Sequoia sempervirens (redwood). Thuja occidentalis, &c., and in the small scales leaves of ordinary species are replaced by the slender, needle-like leaves, which stand out more or less strongly. In the branches of the Thuja, Cupressus, Thuja (arbor vitae), Thuja plicata (Nootka), the Kauri pine of New Zealand, is the deciduous habit of the branches; these become detached from the main trunk leaving a well-defined albsce-surface, which appears as a depressed circular scar on the stem. A new genus of conifers, Taiwania, has recently been described from the island of Formosa; it is said to agree in habit with the Japanese Cryptomeria, but the cones appear to have a staminal column similar to that of the Ararucarias described any other genus.

GYMNOSPERMS

cones, 1 to 2 ft. in length, of the sugar pine of California (Pinus Lambertiana) and other species. Smaller cones, less than an inch long, occur in the larch, Abietopsis (Tasmania), Fothergilla (Patagonia and Australia). These cones are morphologically similar to those of the Abietinaceae, but they differ in the fact that the scales appear to be single, even in the young condition; each cone consists of two or more scales, which become separated by the development of the seeds, while in the Araucariane (Araucaria and Agathis) each cone has one seed. The Cupressinaceae have cones composed of a few scales arranged in alternate whorls; each scale bears two or more seeds, and on drying becoming separated into its distinct parts. In the junipers, the scales become fleshy as the seeds ripen, and the individual scales fuse together in the form of a berry. The female flowers of the Taxaceae assume another form; in Abietoptera, they are small, sessile, and the flowers are sporadically disposed, and form small globular cones made up of red fleshy scales, to each of which is attached a single ovule enclosed by an integument and two carpels. In Abietinaceae (fig. 12), the fleshy bracts, which leaves are very similar to the foliage leaves—each bears one ovule with two integuments, the outer of which constitutes an arillus. Finally, in the yew, as a type of the family Taxaceae, the ovules occur singly at the apex of a lateral branch, enclosed when ripe, by a conspicuous red or yellow fleshy arillus, which serves as an attraction to animals, and thus aids in the dispersal of the seeds.

It is important to draw attention to some structural features exhibited by certain cone-scales, in which there is no external sign indicative of the presence of a carpellary and a seminiferous scale. In Araucaria Cookii and some allied species each scale bears two or more leaves from its base near the distal end; the scales of Cunninghamia (China) are characterized by a somewhat ragged membranous projection extending across the upper face between the seeds and the distal margin of the scale. In Abietopsis (fig. 15) the scale has a prominent rounded ridge occupies a corresponding position. These projections and ridges may be homologous with the seminiferous scales of the gymnosperms. The interpretation of the cone of the Abietinaceae is that which regards it as a flower consisting of an axis bearing several open carpels, in which the adult cone may be very small or large and prominent, the scale bearing the ovules regarded as a placental outgrowth from the flower axis. In Araucaria the cone-scale is regarded as consisting of a flat carpel, of which the placenta has not grown out into the scale-like structure. The seminiferous scale of Pinus, &c., is also spoken of as a leaf, sometimes as a leafy bract, which is broader and longer than the scales. Robert Brown, in 1828, first gave a clear description of the morphology of the Abietinaceae cone in which carpsels bear naked ovules; he recognized gymnospermy as an important distinguishing feature in conifers as well as in cycads. Another view is to regard the cone as an inflorescence, each carpellary scale being a bract bearing in its axil a shoot the axis of which has not been developed; the seminiferous scale is believed to represent either a single leaf or a fused pair of leaves belonging to the partially suppressed axillary shoot. In 1869 van Tieghem laid stress on anatomical evidence as a key to the morphology of the cone, and the interpretation of the vascular bundles of the seminiferous scale as being oriented as compared with those of the carpellary scale; in the latter the xylem of each bundle is next the upper surface, while in the seminiferous scale, the xylem is next to the lower surface. Subsequently it was found that the seminiferous scale (fig. 15, B, Se) is the first and only leaf of an axillary shoot (b) borne on that side of the shoot, the axis of which is suppressed, opposite the subtending bract (fig. 15, A, B, C, Se, Br) and in this respect the cone is similar to that suggested by von Mohl in the case of the double leaf of Sciadopitys, and to consider the seed-bearing scale as being made up of a pair of leaves (fig. 15, A, a, o) of an axillary shoot (b) fused into one by their posterior margins (fig. 15, A). The latter view receives support from abnormal cones in which carpellary scales subtend axillary shoots, of which the first two leaves (fig. 15, C, P, P) are often broader and longer than the others; forms have been described transitional between axillary shoots, in which the leaves are separate, and others in which the leaves are more or less completely fused. In a young cone the seminiferous scale appears as a bract, being replaced by an axial shoot, according to Carl Celakovský, a strong supporter of the axillary-bud theory, attaches little or no importance to this kind of evidence, regarding the present manner of development as being merely an example of a short cut adopted in the course of evolution, and replacing the original production of a branch in the axil of each carpellary scale. Eicher, one of the chief supporters of the simpler view, does not recognize in the inner cone the auxiliary bud, but points out that the seminiferous scale, being an outgrowth from the surface of the carpellary scale, would, like its opposite, have an auxiliary bud, naturally its bundles being inversely orientated. In such cases there is an external indication of double origin, e.g. Araucaria (fig. 15, D) sequoia, &c., there are always two sets of bundles; the upper set, bearing the ovules, and the lower, which are always fleshy, or Pinus, are regarded as belonging to the outgrowth from the carpellary scale and specially developed to supply the ovules. Monocous cones are fairly common; these in some instances lend support to the axillary-bud theory, and it has been said that this theory owes its existence to evidence furnished by abnormal cones. It is difficult to estimate the value of abnormalities as evidence bearing upon the evolution of the conifer cone, as chief danger lies in the inviting undue weight to them, but there is also a risk of minimizing their importance. Monostrosities at least demonstrate that even a single cone-scales may, however, simply mean that buds, which are usually undeveloped in the axes of sporophylls, occasionally afford evidence of their existence. Some monstrous cones lend no support to the axillary-bud theory. In Larix the axis of the cone often continues to grow; similarly in Cupressus the cones are often proliferous. (In rare cases the proliferated portion produces male flowers in the leaf-axils.) In Larix the carpellary scale may become leafy, and the seminiferous scale may disappear. Androgynous cones may be produced, as in the Cones of Taxus (fig. 16), in which the lower part bears stamens and the upper portion carpellary and seminiferous scales. An interesting case has been figured by Masters, in which scales of a cone of Cupressus Lawsoniana bear ovules on the upper surface and stamens on the lower face. One argument that has been adduced in support of the axillary-bud theory is derived from the Palaeozoic type Cordaites, in which each ovule occurs on an axis borne in the axil of a bract. The whole question is still unsolved, and perhaps insoluble. It may be that all theories of the double cone-scale of the Abietinaceae are in an inflorescence, which finds favour with many botanists, cannot be applied to the cones of Agathis and Araucaria. Without expressing any decided opinion on the theory of the double cone-scale of the Abietinaceae, preference may be felt in favour of regarding the cone-scale of the Araucariaceae as a simple carpellary leaf bearing a single ovule. A discussion of this question may be found in a paper on the Araucariaceae by Seward and Ford, published in the Transactions of the Royal Society (London of 1906). Cordaites is an extinct type, Pinus rigida, in which certain respects resembles Ginkgo, cycads, and the Araucariaceae, but its agreement with true conifers is probably too remote to justify our attributing much weight to the bearing of the morphology of its female flowers on the interpretation of that of the Coniferae. The greater simplicity of the Eicher theory may prejudice us in its favour, but on the other hand the argument of other theories and the axillary-bud theories are perhaps not sufficiently cogent to lead us to accept an explanation based chiefly on the uncertain evidence of monostrosities.

A pollen-grain when first formed from its mother-cell consists of a single cell; in this condition it may be carried to the nucellus of the ovule (e.g. Taxus, Cupressus, &c.), or more usually (Pinus, Larix, &c.) it reaches maturity before the dehiscence of the microsporangium. The nucleus of the microspore divides and gives rise to a small cell within the large cell, a second small cell is then produced; this is the structure of the ripe pollen-grain in some conifer species (Taxus, &c.). The large cell grows out as a pollen-tube; the second of the two small cells (body-cell) wanders into the tube, followed by the nucleus of the first small cell (stalk-cell). In Taxus the body-cell eventually divides into two, in which the products of division are of unequal size, the larger constituting the male generative cell, which fuses with the nucleus of the egg-cell. In Juniperus the products of division of the

(C and D after Wendell.)
body-cells are equal, and both function as male generative cells. In the GYMNOSPERMS the megasporocyte in the pollen-grain is carried farther. Three small cells occur inside the cavity of the microspore; two of them collapse and the third divides into two, forming a stalk-cell and a large body-cell. The latter ultimately divides perpendicularly into two motile generative cells. Evidence has lately been adduced of the existence of numerous nuclei in the pollen-tubes of the Araucariaceae, and it seems probable that this is in several or more of the Coniferales as a rule. In all these cases the fertilization of the egg-cells by a single generative cell characterizes the family. 

Anatomy. The outer integument is thick and somewhat irregular bands of thickening on the cell-walls of the cortical layer next to the endodermis. These bands, which are common in Phanerogams, are here replaced by fibrous bands, and have stopped against the margin of the ovum and remain separate. It is not always easy to distinguish a root from a stem in the seed, and some authors have found that the Coniferales are most readily distinguished from the Cycadaceae and the Gymnosperms by the size and number of the sporophyte and its nuclei. 

In the Sapindaceae the microspores are united in bundles of two or three, and in the Taxaceae, the microspores are united in bundles of five. In the Araucariaceae and Saxeotheca the microspores are united in bundles of two or three. In the Podocarpaceae the microspores are united in bundles of four. In the Coniferales and Cycadaceae the microspores are united in bundles of five. In the Araucariaceae and Saxeotheca the microspores are united in bundles of two or three.
GYMNOSPERMS

central cylinder of the stem, and does not assume the girdle-like form characteristic of the true conifers. 

leaf-trace leaves the stele of the stem as a single bundle which splits up into several strands in its course through the cortex. In the wood of the true conifers, the leaf-traces are more regularly parallel than in the deciduous. The leaf-trace is an unbranched fiber, the leaf-trace of Ginkgo. A detailed account of the anatomical characters of conifers has been published by Professor A. D. Penhallow of Montreal and Dr. Gothan of Berlin which will not be repeated here.

leaves most useful for diagnostic purposes are the position of the stem, the presence and arrangement of resin-cans, the structure of the mesophyll and vascular bundles. The presence of hypodermal fibres is one of the most characteristic features of the conifers. The occurrence of needle-like leaves is too closely connected with external conditions to be of much systematic value. A pine needle grown in continuous light differs in no way from its counterpart grown in darkness. In the leaves of Ginkgo, the mesophyll is not divided into leaf-traces.

The endomeres in Pinus, Picea and many other genera is usually a well-defined layer of cells enclosing the vascular bundles, and separated from them by a tissue consisting in part of ordinary parenchyma and to some extent of isodiametric tracheids; but this tissue is usually more or less thickened, as in the leaves of evergreen conifers, a characteristic of all the true conifers, which give the landscape a sombre aspect, suggesting a comparison with the forest vegetation of the Carboniferous period. In the North American area of Pinus pumila, Abies balsamea (balsam fir), Tsuga canadensis (hemlock spruce), Pinus strobus (Weymouth pine), Tsuga occidentalis (white cedar), Taxus canadensis are characteristic species. In the Mediterranean region occur Cupressus sempervirens, Pinus pinea (stone pine), species of juniper, Cedrus atlantica, C. Libani, C. algeriensis, P. pinaster. Economic importance is abundant on the Atlantic side of North America — in the eastern states. 

Pinus cembra (Cembra or Arolla Pine) has a wide range; also Abies alba (mountain pine), Larix sibirica and Juniperus communis. In the North American area of Picea abies, P. nigra, Larix americana, Abies balsamea (balsam fir), Tsuga canadensis (hemlock spruce), Pinus strobus (Weymouth pine), Tsuga occidentalis (white cedar), Taxus canadensis are characteristic species. In the Mediterranean region occur Cupressus sempervirens, Pinus pinea (stone pine), species of juniper, Cedrus atlantica, C. Libani, C. algeriensis, P. pinaster. leaves of Pinus and Cedrus is characteristic of the two genera. In the leaves of Lepidodendron, the leaf-trace consists of three parallel bundles, with the three leaf-traces of each bundle bound together by a middle leaf-trace, the whole forming an infolding of the cells of the leaf. In many leaves, e.g. Abies, Tsuga, Larix, &c., the mesophyll is heterogeneous, consisting of palisade and spongy parenchyma. In the leaves of Araucaria imbricata, in which palisade-tissue occurs in both the upper and lower part of the mesophyll, the resin-cans are placed between the veins; in some species of Podocarpus (sect. Nagea) a canal occurs below each vein; in Tsuga, Torreya, Cephalotaxus, Sequoia, &c., a single canal occurs below the midrib; in Larix, Abies, &c., two canals run through the leaf parallel to the margins. The stomata are frequently arranged in rows, their position being marked by two white bands of wax on the leaf margins.

The chief home of the Coniferales is in the northern hemisphere, where certain species occasionally extend into the Arctic circle, and penetrate beyond the northern limit of deciduous forest. The greatest range is in Europe, Persia and Asia Minor; Juniperus communis, &c. In north Siberia the range is extensive, extending south to the mountains of the Mediterranean region — Pinus sylvestris (Scottish fir), reaching from the far north to the highlands of Persia and Asia Minor; Juniperus communis, &c. In north Siberia the range is extensive, extending south to the mountains of the Mediterranean region — Pinus sylvestris (Scottish fir), reaching from the far north to the highlands of Persia and Asia Minor; Juniperus communis, &c. is filled with tissue as in typical Gymnosperms, and from some of the superficial cells 3 to 8 archegonia are developed, characterized by long multicellular necks. The archegonia are separated from one another, as in *Pinus*, by some of the prothallus-tissue, and the cells next the egg-cells (tapetal layer) contribute food-material to their development. After fertilization, some of the uppermost bracts below each of the above-mentioned and flestly: the perianth develops into a woody shell, while the integument remains membranous. In some species of *Ephedra*, e.g., *E. altissima*, the fertilized egg grows into two prophyllar proembryos, from the tip of each of which embryos begin to be developed, but one only comes to maturity. In *Ephedra helvetica* as described by Jaccard, no proembryo or suspensor is formed; but the most vigorous fertilized egg, after undergoing several divisions, becomes attached to a tissue, termed the columella, which serves the purpose of a primary suspensor; the columella appears to be formed by the lignification of certain cells in the central region of the embryonic axis. At a later stage some of the cells in the upper terminal region of the perianth divide and undergo considerable elongation serving the purpose of a secondary suspensor. The secondary wood of *Ephedra* consists of tracheids, vessels and parenchyma; the vessels are characterized by their wide lumen and by the large simple or slightly-bordered pits on their oblique end-walls.

**Gnetum.**—This genus is represented by several species, most of which are climbing plants, both in tropical America and in warm regions of the Old World. The leaves, which are borne in pairs at the nodum nodes, are oval in form and have a Dicotyledonous type of venation. The male and female inflorescences have the form of simple or paniculate spikes. The spike of an inflorescence bears in whorls of flowers at each node in the axis of concomitant bracts accompanied by numerous sterile hairs (paraphyses); in a male inflorescence numerous flowers occur at each node, while in a female inflorescence the number of flowers is much smaller.

A male flower consists of a single perianth, through the open apex of which the flower-axis projects as a slender column terminating in two anthers. The female flowers, which are more complex in structure, are of two types, complete and incomplete; the latter occur in association with male flowers in a male inflorescence. A complete female flower consists of a nucellus (fig. 17, A, P), an integument, and a suspensor. The nucellus is enclosed in a large, slender, simple, oblong, or ovate capsule, which is covered by the perianth, and the capsule is succeeded by a bony involucre. The nucellar tissue is composed of numerous archegonia of *Ephedra*; the lower part of the embryo-sac, separated from the upper by a constriction, is full of parenchyma. The upper part of the megasporangium may be spoken of as the fertile half (fig. 17, B and C, P), and the lower part, which serves as food-reservoir for the growing embryo, may be termed the sterile half (fig. 17, B and C, S). (Coutler, *Bot. Gazette*, xlv. 1905, regards this tissue as belonging to the nucellus.) At the time of pollination the long tubular integument secretes a drop of fluid at its apex, which holds the pollen-grains, brought by the wind, or possibly to some extent by insects. From the archegonia, separated from one another, as in *Pinus*, some of the prothallus-tissue, and the cells next the egg-cells (tapetal layer) contribute food-material to their development. After fertilization, some of the uppermost bracts below each of the above-mentioned and flestly: the perianth develops into a woody shell, while the integument remains membranous. In some species of *Ephedra*, e.g., *E. altissima*, the fertilized egg grows into two prophyllar proembryos, from the tip of each of which embryos begin to be developed, but one only comes to maturity. In *Ephedra helvetica* as described by Jaccard, no proembryo or suspensor is formed; but the most vigorous fertilized egg, after undergoing several divisions, becomes attached to a tissue, termed the columella, which serves the purpose of a primary suspensor; the columella appears to be formed by the lignification of certain cells in the central region of the embryonic axis. At a later stage some of the cells in the upper terminal region of the perianth divide and undergo considerable elongation serving the purpose of a secondary suspensor. The secondary wood of *Ephedra* consists of tracheids, vessels and parenchyma; the vessels are characterized by their wide lumen and by the large simple or slightly-bordered pits on their oblique end-walls.

**Gnetum.**—This genus is represented by several species, most of which are climbing plants, both in tropical America and in warm regions of the Old World. The leaves, which are borne in pairs at the nodum nodes, are oval in form and have a Dicotyledonous type of venation. The male and female inflorescences have the form of simple or paniculate spikes. The spike of an inflorescence bears in whorls of flowers at each node in the axis of concomitant bracts accompanied by numerous sterile hairs (paraphyses); in a male inflorescence numerous flowers occur at each node, while in a female inflorescence the number of flowers is much smaller.

A male flower consists of a single perianth, through the open apex of which the flower-axis projects as a slender column terminating in two anthers. The female flowers, which are more complex in structure, are of two types, complete and incomplete; the latter occur in association with male flowers in a male inflorescence. A complete female flower consists of a nucellus (fig. 17, A, P), an integument, and a suspensor. The nucellus is enclosed in a large, slender, simple, oblong, or ovate capsule, which is covered by the perianth, and the capsule is succeeded by a bony involucre. The nucellar tissue is composed of numerous archegonia of *Ephedra*; the lower part of the embryo-sac, separated from the upper by a constriction, is full of parenchyma. The upper part of the megasporangium may be spoken of as the fertile half (fig. 17, B and C, P), and the lower part, which serves as food-reservoir for the growing embryo, may be termed the sterile half (fig. 17, B and C, S). (Coutler, *Bot. Gazette*, xlv. 1905, regards this tissue as belonging to the nucellus.) At the time of pollination the long tubular

GYMNOSTOMACEAE—GYNAECOLOGY

GYMNOSTOMACEAE, an order of Ciliata. Infusoria (g.v.), characterized by a closed mouth, which only opens to swallow food actively, and body cilia forming a general or partial investment. They are sometimes classified in the Asciophorinae, or may be differentiated in different regions. With the Aspirtrochacea (g.v.) it formed the Holotricha of Stein.

GYMIE, a mining town of March county, Queensland, Australia, 107 m. N. of Brisbane, and 61 m. S. of Maryborough by rail. Pop. (1901) 11,959. Numerous gold mines are worked in the district, which also abounds in copper, silver, antimony, cinabarin, bismuth and nickel. Extensive undeveloped coal-beds lie 40 m. N. at Miva. Gymie became a municipality in 1880.

GYMNOSPERMUM (Gr. γυνακοεις, from γυνακος, woman), that part in a Greek house reserved for the separate quarters for the men and women in contradistinction to the "andron," the men's quarters; in the larger houses there was an open court with peristyles round, and as a rule all the rooms were on the same level; in smaller houses the servants were placed in an upper storey, and this seems to have been the case to a certain extent in the Homeric house of the Odyssey. "Gynaeconitis" is the term given by Procopius to the space reserved for women in the Eastern Churches, and this separation of the sexes was maintained in the Greek Christian churches where there were separate entrances and accommodation for the sexes, in contradistinction to the andron, being placed in the triform gallery, or, in its absence, either on one side of the church, the men being on the other, or occasionally in the aisles, the nave being occupied by the men.

GYNAECOLOGY (from Gr. γυνη, γυναικος, a woman, and nýros, discourse), the name given to that branch of medicine which concerns the pathology and treatment of affections peculiar to the female sex.

Gynaecology may be said to be one of the most ancient branches of medicine. The papyrus of Ebers, which is one of the oldest known works on medicine and dates from 1550 B.C., contains references to gynaecological affections. In modern times James Parsons (1702-1777) is published Elenchus gynaecopathologicus et obstetricarius, and in 1755 Charles Perry published his Mechanical account and explanation of the hysterical passion and of all other nervous disorders incident to the sex, with an appendix on cancers. In the early part of the 19th century fresh interest in diseases of women awakened. Joseph Récamier (1774-1832) by his writings and teachings advocated the use of the speculum and sound. This was followed in 1840 by the writings of Simpson in England and Huguer in France. In 1845 John Hughes Bennett published his great work on obstetrics, and in 1850 Tilt published his book on ovarian inflammation. The credit of being the first to perform the operation of ovariotomy is now credited to McDowell of Kentucky in 1809, and to Robert Lawson Tait (1845-1859) in 1883 the first operation for ruptured ectopic gestation.

Menstruation.—Normal menstruation comprises the escape of 4 to 6 oz. of blood together with mucus from the uterus at intervals of twenty-eight days (more or less). The flow begins at the age of puberty, the average age of which in England is between fourteen and sixteen years. It ceases between forty-five and fifty years of age, and this is called the menopause or climacteric period, commonly spoken of as "the change of life." Both the age of puberty and that of the menopause may supervene earlier or later according to local conditions. At both times the menstrual flow may be replaced by haemorrhage from distant organs (epistaxis, haematometria, haemoptysis); this is called verticous menstruation. Menstruation is usually but not necessarily coincident with ovulation. The usual
Gynaecology

Disorders of menstruation are: (1) amenorrhoea (absence of flow), (2) dysmenorrhoea (painful flow), (3) menorrhagia (excessive flow), (4) metrorrhagia (excessive and irregular flow). Amenorrhoea may be caused by pregnancy, lactation, the menopause; constitutional causes, such as puthitis, anaemia and chlorosis, febrile disorders, some chronic intoxications, such as morphine and chloroform. They are divided into primary or secondary. Primary amenorrhoea is one which includes malformations or absence of one or more of the genital parts, such as absence of ovaries, uterus or vagina, atresia of vagina, imperforate cervix, disease of the ovaries, or sometimes imperfect formation of these organs. Secondary amenorrhoea is the failure of menstruation to occur after its regular establishment. Menorrhagia is the excessive loss of menses which may result from great increase in the size of the ovaries, from injuries, such as during child-birth, from uterine tumors, and from hemorrhoidal disease. Metrorrhagia is hemorrhage occurring in the absence of menstruation. Amenorrhoea is permanent when due to the absence of the genital parts. The condition may be caused by the irritation of the ovaries, by the formation of fibroids, or by disease of the ovaries or Fallopian tubes; (2) obstructive, due to some obstacle to the flow, as stenosis, flexions and malpositions of the uterus, or malformation; (3) relative, due to suraevolution, chronic inflammation of the uterus or its lining membrane, fibroid growths and polyph of the uterus, cardiac or hepatic disease; (4) neuralgic; (5) membranous. The foremost place in the treatment of dysmenorrhoea must be given to aperients and purgatives administered a day or two before the period is expected. By this means congestion is reduced. Hot baths are useful, and various drugs such as hyoscyamus, cannabis indica, phenolin, ammonium chloride and ephedrine have been employed with success in acute cases. Treatment is, however, only palliative, and flexions and malpositions of the uterus must be corrected, stenosis treated by dilatation, fibroid growths removed, and the patient prepared for future treatment by local applications or cureting according to its severity. Menorrhagia signifies excessive bleeding at the menstrual periods. Constitutional causes are purura, haemorrhacia, excessive food and alcoholic drinks and warm climate; while local causes are congestion and displacements of the uterus, endometritis, subinvolution, retention of the products of conception, new growths in the uterus such as myomas and fibroid polypi, malignant disease, and inflammation and some varicocele. Metorrhagia is a discharge of blood from the uterus, independent of menstruation. It always arises from disease of the uterus or its appendages. Local causes are polypi, endometritis, endometriosis with retention of discharge, haemorrhages in connexion with pregnancy, and new growths in the uterus. The treatment of both menorrhagia and metorrhagia the local condition must be carefully ascertained. When pregnancy has been excluded, and constitutional causes having been removed, efforts should be made to relieve congestion. Uterine haemostatics, as ergot, ergin, tincture of hydrastis or hamamelis, are of use, together with rest in bed. Fibroid polypi and other new growths must be removed. Irregular bleeding in women over forty years of age is frequently a sign of early malignant disease, and should on no account be neglected.

The External Genital Organs.—The vulva comprises several organs and structures grouped together for convenience of description (see Reproductive System). The affections to which these structures are subject may be conveniently divided into two classes: (1) those to the vulva, either accidental or occurring during parturition; these are generally rupture of the perineum. (2) Vylitis. Simple vulitis is due to want of cleanliness, or irritating discharges, and in children is the result of the inflammatory condition into which the vulva, including varix, haematoma, oedema and gangrene; the treatment is the same as for the same disease in other parts. (4) Vylitis is the inflamed tissue formed by a number of cutaneous affections, the symptom most important being erythema, the disease being called elephantiasis, vulitis pruriginis, syphilis and kraurosis. These affections present the same characters as in other parts of the body. Unless attended to, they may result in the most serious consequences. Tractation with saline is often attended with pain and a yellowish discharge; the cause is unknown. Pruritis vulvae is due to parasites, or to irritating discharges, as leucorrhoea, and is frequent in diabetic subjects. The hygiene of the vulva is very important. In the female the rectum is more distant from the vulva than in the male, and the line of infection is not so easy. As a rule the anus is easy to replace in position. A rubber ring pessary will often serve to keep it there. If the perineum is very tender, a pessary may be retained. The vulva may be the seat of new growths, simple or malignant. Any part of the vulva may be the seat of new growths, simple or malignant. The cause of these conditions is relaxation of the tissues due to parturition. The palliative treatment consists in keeping up the parts by the means already named. A pessary may sometimes be useful. Ferrous sulphate may be given as an anti-coagulant. (3) Fistulae may form between the vagina and bladder or vagina and rectum; they are generally caused by injuries during parturition or the late stages of carcinoma. Persistent fistulae may be treated by the application of a tincture of phenacetin or an opalescent acid fluid derived from the lymph serum and the shedding of the squamous epithelium. This fluid normally contains the vagina bacillus. In pathological conditions of the vagina this secretion may contain a large number of organisms. A simple fistula may be closed by the insertion of a tincture of phenacetin or a similar dressing to which has been added an emulsion of beef liver. (4) Vaginitis may be described: (a) simple catarrhal vaginitis in due to the same causes as simple vulitis, and occasionally in children is caused by the infection of a local gland or adenitis from the vulitis. The symptoms are heat and discomfort with copious mucopurulent discharge. The only treatment required is rest, with vaginal douches of warm unirritating lotions such as boracic acid or simple tincture of iodine. After the discharge has ceased the vaginitis is cured. The vagina is rarely the seat of tumours, but cysts are common.

Diseases of the Uterus.—The uterus undergoes important changes during pregnancy, delivery and the puerperal state. At the menopause, the uterus undergoes degenerative changes, and the symptoms are severe, such as severe pain, with a discharge; the uterus may be retained inside the abdomen; the ovaries are always involved in the changes. The symptoms are dysmenorrhoea, pain on defaecation and constipation from the pressure of the fundus on the rectum; the patient is often sterile. In chronic cases there is much leucorrhoea, the uterus is small, and the discharge may be kept by the insertion of a pessary; failing this, operative treatment may be required. Retention of pus is a frequent complication. In acute cases the conditions are caused by injury or inflammation; in chronic cases the discharge is more constant, and the uterus may be hardened to the feel of a normal. At the menopause the uterus is often hard. If the bladder is empty, is that of anteversion. We have here to consider the following conditions as pathological: anteversion, retroversion, prolapse and proctidemia. Slight anteversion or bending forwards is normal; when exaggerated it gives rise to dysmenorrhoea, stiffness and reflex nervous phenomena. This condition is usually congenital and is not dangerous. Retroversion is to be treated with the assistance of external traction, and the symptoms can be relieved by the use of pessaries. The treatment is by dilatation of the canal or by a plastic operation. Retropulsion is a bending over of the uterus backwards, and occurs as a complication of retroversion (or dislocation) of the uterus. It is a serious condition. The normal position of the uterus is anteflexion. The symptoms are those of retroversion with feeling of pain and weight in the pelvis and desire to micturate followed by retention of urine due to the pressure of the cervix and corpus upon the bladder. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis. The symptoms are usually those of anteversion, but the fundus of the uterus is nearly always included in the symphysis.
prolapse, or any condition interfering with the circulation. The symptoms comprise local discomfort and sometimes dysmenorrhoea, leucorrhoea or menorrhagia. When the elongation occurs in the cervical portion the only possible treatment is amputation of the cervix, with or without a portion of the upper end of the uterus, which may follow the removal of the tubes and ovaries. Some constitutional diseases produce the same result, as tuberculosis, chlorosis, chronic morphinism and certain diseases of the central nervous system.

(c) Injuries and Diseases resulting from Pregnancy.—The most frequent of these injuries is laceration of the cervix uteri, which is frequent in primigravida, and is due to insufficient relaxation of the surrounding tissues. The laceration of the cervix may extend into the body of the uterus, or into the vagina. In the former case suction curettage may be tried, but if this is not possible the operation of hysterotomy may be required. Perforation of the vagina may occur from the use of instruments, or from the introduction of foreign bodies. The uterus may also be perforated, and the resulting haemorrhage may require treatment by suction and removal of the products of conception.

(d) Infections Acute and Chronic.—The mucous membrane lining the cervical canal and body of the uterus is called the endometrium and is an organ of great activity. An increase in the number of blood-vessels and other changes in the tissues result in a provisional condition of the cervical mucous, known as the inflammatory state of pregnancy. This condition is characterized by an increase in the number of white cells and an increase in the number of inflammatory bodies, and is accompanied by a marked increase in the blood supply to the cervical mucous. The inflammatory condition of pregnancy is a temporary condition, and the tissues become more susceptible to infection during pregnancy. The condition is most liable to occur in pregnancy, and the patient may present symptoms of acute inflammation of the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries. The symptoms of acute inflammation of the cervix or body of the uterus are the same as those of chronic inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.

In the chronic inflammatory condition of pregnancy the symptoms are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries. The chronic inflammatory condition of pregnancy is a more serious condition than the acute inflammatory condition, and the symptoms are more prolonged.

The symptoms of chronic inflammation of the cervix or body of the uterus are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.

The symptoms of chronic inflammation of the cervix or body of the uterus are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.

The symptoms of chronic inflammation of the cervix or body of the uterus are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.

The symptoms of chronic inflammation of the cervix or body of the uterus are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.

The symptoms of chronic inflammation of the cervix or body of the uterus are the same as those of acute inflammation, and the diagnosis is made by the presence of pus in the uterine cavity, and the presence of pus in the cervix or body of the uterus, or of the Fallopian tubes, or of the ovaries.
are liable to inflammatory affections, tuberculosis, sarcoma, cancer, choriopithelioma and tubal pregnancy. Salpingitis (inflammation of the oviducts) is nearly always secondary to septic infection of the genital tract. The chief causes are septic endome-
tritis, peri- and post-auricular infection, and in the case of the

tuberculosis and cancer of the uterus; it sometimes follows the

specific fevers. When the pus escapes from the tubes into the coelom

it sets up pelvic peritonitis. When the inflammation is adjacent to the

abdominal wall, it gives rise to a tender and tender organ.

Terminology-Illusions and Peritonitis. It is also important that the

follow the rupture of ovaries' dermoid cysts, rupture of the

uterus, extra uterine pregnancy or extension from pyosalpinx. The

The occurrence of these conditions, with the associated pelvic

tubal peritonitis, may be accompanied by constitutional distur-

bances, vomiting, restlessness, or delirium. The abdomen is

fixed and tympanitic. Its results are the formation of adhesions

abnormal positions of the organs, or chronic abdominal girths.

In its prolonged form it gives rise to a club-shaped abdomen,

being forthcoming, until the remarkable case published by Dr

Catherine van Tussenbroek of Amsterdam in 1899 (Bland-Sutton).

with the ovary and Fallopian tube, there are sometimes adhesions:

be; it sometimes complicates uterine pregnancy; rarely both tubes

when the ovary lodes in the ampulla or isthmus it is called tubal

gestation; when it is retained in the portion traversing the uteri

wall it is called tubo-uterine gestation. Wherever the ovary

remains and implants its villi the tube becomes turgid and swollen,

and the abdominal ostium gradually closes. The ovum in this

situation is liable to apoplexy; forming tubal mole. When the

abdominal cavity may be due to tumours of the abdomen benign

tuberculosis of the peritoneum. (4) Pelvic cellulitis (parametritis)

signifies the inflammation of the connective tissue between the folds

and peritoneum. (parametritis) and dermoid cysts. (2) Pelvic

changes following abortion, delivery at term (especially instru-

mental delivery), following operations on the uterus or salpingitis.

The greatest care should be taken by severe intrapelvic pain and,

tension 100° to 102°F. They may undergo atrophy, adhesion,

rectal tenesmus and dysuria. If consequent on parturition the

lochia cease or become offensive. On examination there is tender-

ness and swelling in one flank and the uterus becomes fixed and

immovable in the exudate as if embedded in plaster of Paris. The

illness may go to resolution if treated by rest, opium, hot stipes

or ice-bags and glycerine tampons, or may go on to suppuration

forming pelvic abcess. which signifies a collection of pus between the

layers of the broad ligament. The pus in a pelvic abcess may point

and escape through the walls of the vagina, rectum or bladder.

If, however, the point of exit be localized an incision should be

made and the abcess drained. The tumours which arise in the broad

ligament are haematocele, solid tumours (as myomata, lipomata

and sarcomata), and echinococcus colonies (Gallbladder, 1900).

Gyöngyösi, István [Stephen] (1620-1704), Hungarian poet, was born of poor but noble parents in 1620. His abilities early attracted the notice of Count Ferencz Wesselényi, who in

1640 appointed him to a post of confidence in Fülek castle. Here he

remained till 1653, when he married and became an assessor of

the judicial board. In 1658 he was elected as a representative of

his county at the diet held at Soprony (Oedenburg). From

1658 to 1693, and again from 1700 to his death in 1704, he was

deputy lord-lieutenant of the county of Gomor. Of his literary

works the best known is the first instalment of the "István Vénoci,"

(1664), in honour of his benefactor's wife Maria Szécsé, the heroine

of Murány. Among his later productions the best known are

Rózsák-Kassorát, or Rose-Wreathe (1690), Kemény-János (1693),

Cupidás (1653), Palidina (1669) and Chariklia (1700).

The earliest edition of his collected poetical works is by Bugonics

(1723); and Poti, 1797). The best modern selection is that of

Toldy, entitled Gyöngyösi István [Stephen] (1878; 2 vols., 1884-1885).

Györ (Ger. Raab), a town of Hungary, capital of a county of

the same name, 88 m. W. of Budapest by rail. Pop. (1900)
GYP—GYPSUM

27,758. It is situated at the confluence of the Raab with the Danube, and is composed of the inner town and three suburbs. Győr is a well-built town, and is the seat of a Roman Catholic bishop. Amongst its principal buildings are the cathedral, dating from the 13th century, and rebuilt in 1509–1544; the bishop's palace; the town hall; the Roman Catholic seminary for priests and several churches. There are manufactures of cloth, machinery and tobacco, and an active trade in grain and horses. Twenty miles by rail W.S.W. of the town is situated Cserna, a village with a Premonstratensian abbey, whose archives contain numerous valuable historical documents.

Győr is one of the oldest towns in Hungary and occupies the site of the Roman Arbona. It was already a place of some importance in the 10th century, and its bishopric was created in 1010. The town was long thatched, with a strongly fortified town which resisted successfully the attacks of the Turks, into whose hands it fell by treachery in 1594, but they retained possession of it only for four years. Montecuccoli made Győr a first-class fortress, and it remained so until 1783, when it was abandoned. At the beginning of the 19th century, the fortifications were re-erected, but were easily taken by the French in 1809, and were again stormed by the Austrians on the 28th of June 1849.

About 11 m. S.E. of Győr on a spur of the Bakony Forest lies the famous Benedictine abbey of Fannonhalma (Ger. St. Martinberg); Lat. Mon. Sancti Martini, one of the oldest and wealthiest abbeys of Hungary. It was founded by King St. Stephen, and the original deed from 1001 is preserved in the archives of the abbey. The present building is a block of palaces, containing a beautiful church, some of its parts dating from the 12th century, and lies on a hill 1200 ft. high. The church has a tower 130 ft. high. In the convent there are a seminary for priests, a normal school, a gymnasiaum and a library of 200,000 vols. The chief abbot has the rank of a bishop, and is a member of the Upper House of the Hungarian parliament, while in spiritual matters he is subordinate immediately to the Roman curia.

GYP, the pen name of SiVYLE GABRIELLE MARIE ANTOINETTE RICUETI DE MIRABEAU, Comtesse de Martel de Janville (1850–1903) French writer, who was born at the château de Kopsal in the Morbihan. Her father, who was the grand-nephew of the vicomte de Mirabeau and great-nephew of the orator, served in the Papal Zouaves, and died during the campaign of 1860. Her mother, the comtesse de Mirabeau, in addition to some graver compositions, contributed to the Figaro and the Vie parisienne, under various pseudo-noms, papers in the manner successfully developed by her daughter. Under the pen-name of GYP Madame de Martel, who was married in 1869, sent to the Vie parisienne, and later to the Rêve des deux mondes, a large number of social sketches and dialogues, afterwards reprinted in volumes. Her later work includes stories of a more formal sort, essentially differing but little from the shorter studies. The following list includes some of the best known of Madame de Martel's publications, nearly seventy in number: Petit Bob (1882); Autour du mariage (1883); Ce que femme veut (1883); Le Monde à côté (1884); Sans voiles (1885); Autour du divorce (1886); Dans le train (1886); Mademoiselle Louise (1888); Bob au salon (1888–1889); L'Instruction d'un prince (1890); Passionnet (1891); Oh! la grande vie (1891); Une Élection à Tigre-sur-Mer (1890), an account of GYP's experiences in support of a Boulangist candidate; Mariage civil (1892); Ces bons docteurs (1892); Du haut en bas (1893); Mariage de chiffon (1894); Leurs âmes (1895); Le Cœur d'Ariane (1895); Le Bonheur de Ginette (1896); Tôtoë (1897); Lune de miel (1898); Israel (1898); L'Entrevue (1899); Le Pays des champs (1900); Troph at de chichis (1901); Le Préjugé (1901); La Fête (1902); Un Mariage chic (1902); Un Mariage dernier cri (1903); Maman (1904); Le Cœur de Pierrette (1905). From the first "Gyp," writing of a society to which she belonged, displayed all the qualities which have given her a distinct, if not pre-eminent, position among writers of her class. Those qualities included an intense faculty of observation, much skill in innuendo, a mandarin wit combined with some breadth of humour, and a singular power of animating ordinary dialogues without destroying the appearance of reality. Her Parisian types of the spoiled child, of the precocious schoolgirl, of the young bride, and of various masculine figures in the gay world, have become almost classical, and may probably survive as faithful pictures of luxurious manners in the 19th century. Some later productions, inspired by a violent anti-Semitic and Nationalist bias, deserve little consideration. An earlier attempt to dramatize Autour du mariage was a failure, not owing to the audacities which it shares with most of its author's works, but from lack of cohesion and incident. More successful was Mademoiselle Éve (1895), but indeed "Gyp's" successes are all achieved without a trace of dramatic faculty. In 1901 Madame de Martel furnished a sensational incident in the Nationalist campaign during the municipal elections in Paris. She had said to be a victim of a kidnapping outrage or piece of horseplay provoked by her political attitude, but though a most circumstantial account of the outrages committed on her and of her adventurous escape was published, the affair was never clearly explained or verified.

GYPSUM, a common mineral consisting of hydrous calcium sulphate, named from the Gr. γύπος, a word used by Theophrastus to denote not only the raw mineral but also the product of its calcination, which was employed in ancient times, as it still is, as a plaster. When crystallized, gypsum is often called calcined plaster. The chief source is the oolitic deposits of Dordogne, so named from οόλικος, "the moon," probably in allusion to the soft moon-like reflection of light from some of its faces, or, according to a legend, because it is found at night when the moon is on the increase. The granular, marble-like gypsum is termed alabaster (q.v.).

Gypsum crystallizes in the monoclinic system, the habit of the crystals being usually either prismatic or tabular; in the latter case the broad planes are parallel to the faces of the clinopinacoid. The crystals may become lenticular by curvature of certain faces. In the characteristic type represented in fig. 1, f represents the prism, l the hemi-pyramid and P the clinopinacoid. Twins are common, e.g., fig. 2, forming in some cases arrow-headed and swallow-tailed crystals. Cleavage is perfect parallel to the clinopinacoid, yielding thin plates, often diamond-shaped, with pearly lustre; these flakes are usually flexible, but may be brittle, as in the gypses of Montmartre. Two other cleavages are recognized, but they are imperfect. Crystals of gypsum, when occurring in clay, may enclose much muddy matter; in other cases a large proportion of sand may be mechanically entangled in the crystals without serious disturbance of form; whilst certain crystals occasionally enclose cavities with liquid and an air-bubble. Gypsum not infrequently becomes fibrous. This variety occurs in veins, often running through gypseous marls, with the fibres disposed at right angles to the direction of the vein. Such gypsum when cut and polished has a pearly opalescence, or satiny sheen, whence it is called satin-spar (q.v.).

Gypsum is so soft as to be scratched even by the finger-nail (H = 2 to 2). Its specific gravity is about 2·3. The mineral is slightly soluble in water, one part of gypsum being soluble, according to G. K. Cameron, in 372 parts of pure water at 26° C. Waters percolating through gypseous strata, like the Keuper marls, dissolve the calcium sulphate and thus become permanently hard or "selenitic." Such water has special value for brewing pale ale, and the water used by the Burton breweries is of this character; hence the artificial dissolving of gypsum in water for brewing purposes is known as "borotization." Deposits of gypsum are formed in boilers using selenitic water. Pure gypsum is colourless or white, but it is often tinted, especially in the alabaster variety, grey, yellow or pink. Gypsum crystallizes with two molecules of water, equal to about 21% by
weight, and consequently has the formula \( \text{CaSO}_4 \cdot 2\text{H}_2\text{O} \). By exposure to strong heat all the water may be expelled, and the substance then has the composition of anhydrite (q.v.). When the calcination, however, is conducted at such a temperature that only about 75\% of the water is lost, it yields a white pulverulent substance, known as "plaster of Paris," which may readily be caused to recombine with water, forming a hard cement. The gypsum quarries of Montmartre, in the north of Paris, were worked in Tertiary strata, rich in fossils. Gypsum is largely quarried in England for conversion into plaster of Paris, whence it is sometimes known as "plaster stone," and since much is sent to the Staffordshire potteries for making moulds it is also termed "potter's stone." The chief workings are in the Keuper marls near Newark in Nottinghamshire, Fauld in Staffordshire and Chellaston in Derbyshire. It is also worked in Permian beds in Cumberland and Westmorland, and in Purbeck strata near Battle in Sussex.

Gypsum frequently occurs in association with rock-salt, having been deposited in shallow basins of salt-water. Much of the calcium in sea-water exists as sulphate; and on evaporation of a drop of sea-water under the microscope this sulphate is deposited as acicular crystals of gypsum. In salt-lagoons the deposition of the gypsum is probably effected in most cases by means of micro-organisms. Waters containing sulphuretted hydrogen, on exposure to the air in the presence of limestone, may yield gypsum by the formation of sulphuric acid and its interaction with the calcium carbonate. In volcanic districts gypsum is produced by the action of sulphuric acid, resulting from the oxidation of sulphur-vapours, on lime-bearing minerals, like labradorite and augite, in the volcanic rocks; hence gypsum is common around solfataras. Again, by the oxidation of iron-pyrites and the action of the resulting sulphuric acid on limestone or on shells, gypsum may be formed; whence its origin in most cases. Gypsum is also formed in some cases by the hydration of anhydrite, the change being accompanied by an increase of volume to 7% the extent of about 60\%. Conversely gypsum may, under certain conditions, be dehydrated or reduced to anhydrite.

Some of the largest known crystals of selenite have been found in southern Utah, where they occur in huge geodes, or crystal-lined cavities, in deposits from the old salt-lakes. Fine crystals, sometimes curiously bent, occur in the Permian rocks of Friedrichroda, near Gotha, where there is a grotto called the Marienglasböhle, close to Rheinhardtsbrunn. Many of the best localities for selenite are in the New Red Sandstone formation (Trias and Permian), notably the salt-mines of Hall and Hallein, near Salzburg, and of Bex in Switzerland. Excellent crystals, usually of a brownish colour arranged in groups, are often found in the brine-chambers and the lavers in salt-works. Selenite also occurs in fine crystals in the sulphur-bearing marls of Gigentien and other Sicilian localities; whilst in Britain very bold crystals are yielded by the Kimeridge clay of Shottorvé Hill near Oxford. Twisted crystals and rosettes of gypsum found in the Mammoth Cave, Kentucky, have been called "oolithophiles" (αιθώς, "woolly"; φιλός, "cave")

In addition to the use of gypsum in cement-making, the mineral finds application as an agricultural agent in dressing land, and it has also been used in the manufacture of porcelain and glass. Formerly it was employed, in the form of thin cleavage-plates, for glazing windows, and seems to have been, with the name of the "sphen," a "sphen of lapis specularis." It is still known in Germany as Marienglas and Frauenstrasse. Delicate cleavage-plates of gypsum are used in microscopic petrography for the determination of certain optical constants in the rock-forming minerals.

**GYROSCOPE AND GYROSTAT.** These are scientific models or instruments designed to illustrate experimentally the dynamics of a rotating body such as the spinning-top, hoop and bicycle, and also the precession of the equinox and the rotation of the earth.

The gyroscope (Gr. γύρος, ring, στοιχεῖον, to see) may be distinguished from the gyrostat (γύρος, and στατικός, stationary) as an instrument in which the rotating wheel or disk is mounted in gimbals so that the principal axis of rotation always passes through a fixed point (fig. 1). It can be made to imitate the motion of a spinning-top of which the point is placed in a smooth agate cup as in Maxwell's dynamical top (figs. 2, 3). (Collected Works, i. 248). A bicycle wheel, with a prolongation of the axle placed in a cup, can also be made to serve (fig. 4).

The gyrostat is an instrument designed by Lord Kelvin (Natural Philosophy, § 343) to illustrate the more complicated state of motion of a spinning body when free to wander about on a horizontal plane, like a top spun on the pavement, or a hoop or bicycle on the road. It consists essentially of a massive fly-wheel concealed in a metal casing, and its behaviour on a table, or with various modes of suspension or support, described in Thomson and Tait, Natural Philosophy, serves to illustrate the curious reversal of the ordinary laws of statical equilibrium due to the gyrostatic domination of the interior invisible fly-wheel, when rotated rapidly (fig. 5).

The toy shown in figs. 6 and 7, which can be bought for a shilling, is acting as a gyroscope in fig. 6 and a gyrostat in fig. 7.

The gyroscope, as represented in figs. 2 and 3 by Maxwell's dynamical top, is provided with screws by which the centre of gravity can be brought into coincidence with the point of support. It can then be used to illustrate Poinsot's theory of the motion of a body under no force, the gyroscope being made kinetically unsymmetrical by a setting of the screws. The discussion of this movement is required for Jacobi's theorems on the allied motion of a top and of a body under no force (Poinsot, Théorie nouvelle de la rotation des corps, Paris, 1857; Jacobi, Werke, ii. Note B, p. 476).

To imitate the movement of the top the centre of gravity is displaced from the point of support so as to give a preponderance. When the motion takes place in the neighbourhood of the downward vertical, the bicycle wheel can be made to serve again
mounted as in fig. 8 by a stalk in the prolongation of the axle, suspended from a universal joint at O; it can then be spun by hand and projected in any manner. The first practical application of the gyroscopic principle was invented and carried out (1744) by Serson, with a spinning top with a polished upper plane surface for giving an artificial horizon at sea, undisturbed by the motion of the ship, when the real horizon was obscured. The instrument has been perfected by Admiral Georges Ernest Fleuriau (fig. 9), and is interesting theoretically as showing the correction required practically for the rotation of the earth. Gilbert's barogyroscopic is devised for the same purpose of showing the earth's rotation; a description of it, and of the latest form employed by Föppl, is given in the Encyc. d. math., Wiss., 1904, with bibliographical references in the article "Mechanics of Physical Apparatus." The rotation of the fly-wheel is maintained here by an electric motor, as devised by G.M. Hopkins, and described in the Scientific American, 1878. To demonstrate the rotation of the earth by the constancy in direction of the axis of a gyroscope is a suggestion that has often been made; by E. Sang in 1836, and others. The experiment was first carried out with success by Foucault in 1851, by a simple pendulum swung in the dome of the Pantheon, Paris, and it has been repeated frequently (Mémoires sur le pendule, 1886). A gyroscopic fly-wheel will preserve its original direction in space only when left absolutely free in all directions, as required in the experiments above. If employed in steering, as of a torpedo, the gyroscope must act through the intermediary of a light relay; but if direct-acting, the reaction will cause precession of the axis, and the original direction is lost. The gyrostatic principle, in which one degree of freedom is suppressed in the axis, is useful for imparting steadiness and stability in a moving body; it is employed by Schlick to mitigate the rolling of a ship and to maintain the upright position of Brennan's monorail car.

Lastly, as an application of gyroscopic theory, a stretched chain of fly-wheels in rotation was employed by Kelvin as a mechanical model of the rotary polarization of light in an electromagnetic field; the apparatus may be constructed of bicycle wheels connected by short links, and suspended vertically.

Theory of the Symmetrical Top.

1. The physical constants of a given symmetrical top, expressed in C.G.S. units, which are employed in the subsequent formulae, are denoted by M, h, c and A. M is the weight in grammes (g) given by the number of gramme weights which equilibrate the top when weighed in a balance; h is the distance OG in centimetres (cm.) let O in G the centre of gravity and O the point of support, and Mk may be called the preponderance in g-cm.; Mk and M can be measured by a spring balance holding up in a horizontal position the axis OC in fig. 8 suspended at O. Then $gMk$ (dyne cm. or ergs) is the moment of gravity about O when the axis OG is horizontal, $gMk$ sin $\theta$ being the moment when the axis OG makes an angle $\theta$ with the vertical, and $g=981$ (cm./s$^2$) on the average; C is the moment of inertia of the top about OC, and A by any axis through O at right angles to OC, both measured in g-cm.$^2$.

To measure A experimentally, swing the top freely about O in small plane oscillation, and determine the length, l cm., of the equivalent simple pendulum; then

$$l = \frac{A}{Mk}$$

Next make the top, or this simple pendulum, perform small conical revolutions, nearly coincident with the downward vertical position of equilibrium, and measure $n$, the mean angular velocity of the conical pendulum in radians/second; and $T$ its period in seconds; then

$$4\pi^2/l^2 = n^2 = g = gMk/A.$$ 

and $f=n/2\pi$ is the number of revolutions per second, called the frequency, $T=2\pi/\sqrt{n}$ in the period of a revolution, in seconds.

2. In the popular explanation of the steady movement of the top at a constant inclination to the vertical, depending on the component of angular velocity, such as is required in the axis OC', which is nearly coincident with OC, of a cylinder mounted by a pedestal; the resistance to the tapping at once disappears, providing the friction of the table prevents the movement of the pedestal; and if the wheel has any preponderance, it falls down.

Familiar instances of the same principles are observable in the movement of a hoop, or in the steering of a bicycle: it is essential that the handle of the bicycle should be free to rotate to secure the stability of the movement.

The bicycle wheel, employed as a spinning top, in fig. 4, can also be held by the stalk, and will thus, when rotated rapidly, convey a distinct muscular impression of resistance to change of direction, if brandished.

A demonstration, depending on the elementary principles of dynamics, of the exact conditions required for the Elemenetary demonstra- tion of the condition of steady motion, when $\theta$, the inclination of the axis, is varying by nutation. It is a fundamental principle in dynamics that if OH is a vector representing to scale the angular momentum of a system, and if OH is the vector representing the axis of the impressed couple or torque, then OH will vary so that the product of the impressed moment and the length of its vector equals the angular momentum, i.e., the product of the impressed moment and the length of its vector equals the angular momentum.

(1)

$$Oh = gMk \sin \theta.$$
In the case of the steady motion of the top, the vector $\mathbf{v}$ lies in the vertical plane COC', in OK suppose (fig. 4), and has a component $OC = G$ about the vertical and a component $OC' = G'$, suppose, about the axis OC; and $G = G'$, if $\mathbf{v}$ denotes the angular velocity of the top with which it is spun about OC'.

If $\mu$ denotes the constant precessional angular velocity of the vertical plane COC', the components of angular velocity and momentum about OA are $\mu \sin \theta$ and $\mu \cos \theta$, and of turning perpendicular to OC' in the plane COC', so that the vector OK has the components

\[(2) \quad OC' = G', \quad \text{and} \quad CK = \mu A \sin \theta,\]

and the horizontal component

\[(3) \quad CK = OC' \sin \theta - CK \cos \theta = G' \sin \theta - A \mu \sin \theta \cos \theta.\]

The velocity of $K$ being equal to the impressed couple $\mathbf{O}_{\mathbf{K}}$, dropping the factor $\sin \theta$, and $\mu = \frac{A \sin \theta}{\sin \theta}$, or $OA \cos \theta - CR + A \mu = 0$, the condition for steady motion.

Solving this as a quadratic in $\mu$, the roots $\mu_1, \mu_2$ are given by

\[(6) \quad \mu_1, \mu_2 = \frac{A}{2} \pm \sqrt{1 - \frac{4 A^2}{G^2} \cos \theta}; \]

and the minimum value of $G' = CR$ for real values of $\mu$ is given by

\[(7) \quad G^2 \tan \theta = CR = 2 \sqrt{\cos \theta};\]

for a smaller value of $R$ the top cannot spin steadily at the inclination $\theta$ to the upward vertical.

Interpreted generally in fig. 4,

\[(8) \quad G = m H \sin \theta \cos \theta, \quad \text{and} \quad C = K \sin \theta (G' \mu - A \mu \cos \theta), \]

so that $K$ lies on a hyperbola with $OC$, $OC'$ as asymptotes.

4. Suppose the top or gyroscopic couple moving freely about the point $O$, is held in a ring which is compelled to rotate about the vertical axis OC with constant angular velocity $\mu$; then if $N$ denotes the couple of reaction of the frame keeping the top from falling, acting in the plane COC', equation (4) $\xi$ becomes modified into

\[(1) \quad G \sin \theta = \frac{N \mu C \sin \theta}{G' \mu - A \mu \cos \theta}, \]

\[(2) \quad N \sin \theta = \frac{\mu \cos \theta - G' \mu}{A \mu + G' \mu} \mu \cos \theta.\]

and hence, as $\mu$ increases through $\mu_1$ and $\mu_2$, the sign of $N$ can be determined, positive or negative, according as the tendency of the axis is to rise or to fall. When $G' = CR$ is large, $\mu$ is large, and

\[(3) \quad \frac{G \mu}{H \sin \theta} = \frac{A \mu}{G' \mu - A \mu \cos \theta},\]

the same for all inclinations, and this is the precession observed in the spinning top and centrifugal machine of fig. 10. This is true accurately when the axis $OC'$ is horizontal, and then it agrees with the result of the popular explanation of § 2.

If the axis of the top OC' is pointing upward, the precession is in the same direction as the motion, and an increase of $\mu$ from $\mu_1$ makes $N$ negative, and the top rises; conversely a decrease of the precession $\mu$ causes the axis to fall (Perry, *Spinning Tops*, p. 48).

If the axis points downward, as in the centrifugal machine with upper support, the precession is in the opposite direction to the rotation, and to make the axis approach the vertical position the precession must be reduced.

This is effected automatically in the Weston centrifugal machine (fig. 10) used for the separation of water and molasses, by the friction of the indiarubber cushions above the support; or else the spindle is produced downwards below the drum a short distance, and turns in a hole in a weight resting on the bottom of the case, which weight is dragged round until the spindle is upright; this second arrangement is more effective when a liquid is treated in the drum, and wave action is set up (Centrifugal Machine, C. A. Mathhey).

Similar considerations apply to the stability of the whirling bowl in a cream-separating machine.

We can write equation (1)

\[(4) \quad N = (A \mu \sin \theta - \mu C) = (A \mu \sin \theta - K \sin \theta),\]

so that $N$ is negative or positive, and the axis tends to rise or fall according as $K$ moves to the inside or outside of the hyperbola of free motion. Thus a tap on the axis tending to hurry the precession is equivalent to an impulse couple giving an increase to $C'K$, and will make $K$ move to the interior of the hyperbola and cause the axis to rise; the steering of a bicycle may be explained in this way; but $K$, when $\mu$ is small, will move away from the hyperbola, and so the axis will fall in this second violent motion.

Friction on the point of the top may be supposed to act like a tap in the direction opposite to the precession; and so the axis of a top subjected to friction will rise at $G'$, or, rising $\mu$ will add to $G'$ and the axis falls back again; or if $OA = \mu A$, according to the direction of the frictional couple, depending on the shape of the point; an analytical treatment of the varying motion is very intractable; a memoir by E. G. Gallop may be consulted in the *Trans. Comb. Phil. Soc.*, 1903.

The earth behaves in precession like a large spinning top, of which the axis describes a circle round the pole of the ecliptic of mean motion at a period of 26,000 years, so that $R = 126,000 \times 365$; and the mean couple producing precession is

\[(5) \quad CR = \sin \theta \times CR' \sin 23\frac{1}{2} \times 36000 \times 365,\]

one 12th millionth part of $1CR^2$, the rotation energy of the earth.

5. If the preponderance is absent, by making the $C$ and $G'$ coincide with $O$, and if $A$ is insensible compared with $G'$,

\[(6) \quad N = G' \mu \sin \theta,\]

the formula which suffices to explain most gyroscopic action.

Thus a carriage running round a curve experiences, in consequence of the rotation of the wheels, an increase of pressure $Z$ on the outer track, and a diminution $Z'$ on the inner, giving a couple in the axle gauge.

\[(7) \quad Z = G' \mu \tan \theta,\]

tending to help the centrifugal force to upset the train; and if $C$ is the radius of the curve, $b$ the width, their moment of inertia, and $v$ the velocity of the train,

\[(8) \quad G' C' = Z' b,\]

acting as a couple on a railway wheels.

**Foucault's gyroscope.**

This is the theory of Gilbert's barogyroscope, described in *Appell's Mécanique rationnelle*, ii. 387; it consists essentially of a rapidly rotated fly-wheel, mounted on knife-edges by an axis perpendicular to its axis of rotation and pointing east and west; spun with considerable angular momentum $G'$, and provided with a slight preponderence $M$, it should tilt to an angle $E$ with the vertical, and thus demonstrate experimentally the rotation of the earth.

The Foucault's *gyroscope* (Comptes rendus, 1852; Perry, p. 103) the preponderance is made zero, and the axis points to the pole, when free to move in the meridian.

Generally, if constrained to move in any other plane, the axis seeks the position nearest to the polar axis, like a dipping needle with respect to the magnetic pole. (A gyrostatic working model of the magnetic compass, by Sir W. Thomson. British Association Report. St. Andrews, 1874. A. S. Chessen, St Louis Academy of Science, January 1902.)

A spinning top with a polished upper plane surface will provide an artificial horizon at sea, when the real horizon is obscured. The instrument is described by W. Adams, called a gyroscopic top by Serson, and is described in the Gentleman's Magazine, *Gyroscopic horizon*, vol. xxv., 1754; also by Segner in his *Specimen theoriae turbinalis* (Halae, 1735). The inventor was sent to sea by the Admiralty to test his instrument, and was shot in the wreck of the "Victory," 1744. A copy of the Serson top, from the royal collection, is now in the Museum of King's College, London. Troughton's No. 360 (1810) is intended for the same purpose.

The instrument is in favour with French navigators, perfected by
Admiral Fleuriaus (fig. 9); but it must be noticed that the horizon given by the top is inclined to the true horizon at the angle $E$ given by equation (3) above; and if $\mu$, is the precessional angular velocity given by (3) $\dot{\theta}$, its period in seconds,

$$\tan \theta = \frac{E \cos \alpha - \sin \alpha t}{\mu}.$$

if $E$ is expressed in minutes, taking $\mu = 2\pi/86400$; thus making the true latitude E nautical miles to the south of that given by the top (Revue maritime, 1890; Comptes rendus, 1896).

This can be seen by elementary considerations of the theory above, for the velocity of the vector $OC$ of the top due to the rotation of the earth is

$$\omega \cdot OC = g \sin \psi = g \frac{E \cos \alpha - \sin \alpha t}{\mu},$$

in which $\omega$ can be replaced by $2\pi$, in practice; so that the Fleuriaus gyroscopic horizon is an illustration of the influence of the rotation of the earth and of the need for its allowance.

In the ordinary treatment of the general theory of the gyroscopic motion, Euler's coordinate angles are referred to two sets of rectangular axes; the one $OX, OY, OZ$ fixed in space, while the other $OX, OY, OZ$ fixed in the rotating wheel with $OZ$ in the axis of figure $OC$.

The relative position of the two sets of axes is given by means of Euler's unsymmetrical angles $\theta, \phi, \psi$; such that the successive turning of the axes $OX, OY, OZ$ through the angles $(i.)$ $\psi$ about $Oz$, $(ii.) \theta$ about $OE$, $(iii.) \phi$ about $OZ$, brings them into coincidence with $OX, OY, OZ$, as shown in fig. 11, representing the concave side of a spherical surface.

Consider, for instance, the motion of a fly-wheel of preponderance $M_h$, and equatorial moment of inertia $A$, of which the axis $OC$ is held in a light ring $ZC$ at a constant angle $\gamma$, while $OZ$ is held by another ring $Z$, which constrains it to move round the vertical $OZ$ at a constant inclination $\theta$ with constant angular velocity $\mu$, so that

$$\dot{\theta} = 0, \; \dot{\psi} = \mu.$$

With the condition, precession, and equation (10), which becomes

$$N \cdot g \mu h \sin \alpha.$$
The velocity of $H$ is in the direction $KH$ perpendicular to the plane $COC'$, and equal to $gM \sin \theta$ or $A\sin\theta$ 
so that if a point in the axis $OC'$ at a distance $O$ from $O$ is projected on the horizontal plane from $C$ in the point $P$ on $CK$, the curve described by $I'$, turned forwards through a right angle, will be the hodograph of $H$; this is expressed by

$$A\sin\theta \sin \theta = \frac{d}{dt}(p\cos \theta)$$

where $p$ is the vector $CH$; and so the curve described by $P$ and the motion of the axis of the top is derived from the curve described by $H$ by a differentiation.

Resolving the velocity of $H$ in the direction $CH$, and integrating

$$\frac{CH}{\sin \theta} = A\sin\theta (E-\cos \theta)$$

$$O= A\sin\theta (E-\cos \theta)$$

$$C'H = A\sin\theta (D-\cos \theta)$$

where $D$, $E$, $F$ are constants, connected by

$$F=E+G/2A\sin^2\theta = G/2A\sin^2\theta$$

Then

$$KIH = \text{OH}_C$$

$$OK\sin^2 \theta = CC'_x = G^2 = G^2 \cos \theta + G^2$$

$$(A\sin^2 \theta) d = A\sin^2 \theta (G-\cos \theta) 
\sin \theta = G^2 + 2G \cos \theta - G^2$$

and putting $\cos \theta = x$

$$2n = 2n^2 (i-\gamma - \gamma) = (G^2 + G^2 \gamma + G^2 \gamma^2)/A^2$$

Denoting the roots of $Z = 0$ by $1, 2, 3$, we shall have them arranged in the order

$$z_1 > z_2 > z_3 > z_4 > z_5$$

where

$$m + n = \sqrt{z_2 - z_1} = \sqrt{z_3 - z_2}$$

can be expressed, when normalized by the factor $\sqrt{(z_2 - z_1)}$, by the inverse elliptic function in the form

$$m = \frac{n}{\sqrt{z_2 - z_1}} = \frac{\sqrt{z_2 - z_1}}{\sqrt{z_3 - z_2}}$$

Interpreted dynamically, the axis of the top keeps time with the beats of a simple pendulum of length.

$$L = l/\sqrt{z_2 - z_1},$$

suspended from a point at a height $l/\sqrt{z_2 - z_1}$ above $O$, in such a manner that a point on the pendulum at a distance $z_2 - z_1$.

From the point of suspension moves so as to be always at the same level as the centre of oscillation of the top.

The polar co-ordinates of $H$ are denoted by $x, y$ in the horizontal plane through $C$; and, resolving the velocity of $H$ perpendicular to $CH$,

$$p = d\omega/dt = A\sin\theta \cos\theta \text{ KCH}$$

$$q = d\omega/dt = A\cos\theta \text{ KCH}$$

$$w = \frac{1}{2} \int G' - G \frac{dt}{A} = \frac{1}{2} \int G' - G \frac{dt}{A}$$

an elliptic integral of the third kind, with pole at $z = E$; and then

$$w = -KCH = -\tan\theta \text{ KCH}$$

$$\tan \theta = \frac{\tan \theta \sin \theta \cos \theta}{G - G' \cos \theta}$$

which determines $\psi$.

Otherwise, from the geometry of fig. 4,

$$C'K \sin \theta = OC - OC' \cos \theta$$

$$\begin{align*}
\alpha \sin \theta \cos \theta &= G - G' \cos \theta \\
\psi &= \frac{1}{2} \int G' - G \frac{dt}{A} = \frac{1}{2} \int G' - G \frac{dt}{A} \\
\end{align*}$$

the sum of the two elliptic integrals of the third kind, with pole at $z = E$; and the relation in (25) (26) shows the addition of these two integrals into a single integral, with pole at $z = E$.

The motion of a sphere, rolling and spinning in the interior of a spherical bowl, or on the top of a sphere, is found to be of the same character as the motion of the axis of a spinning top about a fixed point.

The curve described by $H$ can be identified as a Poinsett herpolhode, that is, the curve traced out by rolling a quadric surface with centre fixed at $O$ on the horizontal plane through $C$; and Darboux has shown also that a deformable hyperboloid made of the generating lines, with $O$ and $H$ at opposite ends of a diameter and one generator fixed in $O$, can be moved so as to describe the curve $H$; the tangent plane of the hyperboloid at $H$ being normal to the curve of $H$; and then the other generator through $O$ will coincide in the movement with $O'$, the axis of the top; thus the Poinsett herpolhode curve $H$ is also the trace made by rolling a line of curvature on an ellipsoid confocal to the hyperboloid of one sheet, on the plane through $C$.

Kirchhoff's "Kinetic Analogue" asserts also that the curve of $H$ is the projection of a torus of the elastica, and that the spherical curve $C'$ is a hodograph of the elastica described with constant velocity.

Writing the equation of the focal ellipse of the Darboux hyperboloid through $H$, enlarged to double scale so that $O$ is the centre, with $\lambda > \mu, \beta > \gamma > a$,

then in the deformation of the hyperboloid, $\lambda$ and $\mu$ remain constant at $H$; and utilizing the moving surface $H$, the statement of Darboux's theorem is verified.

Planes through $O$ perpendicular to the generating lines cut off a constant length $HG = \delta$, $HQ = \delta'$, so the line of curve described by $H$ in the deformation of the hyperboloid, the intersection of the fixed confocal ellipsoid $a$ and hyperboloid of two sheets $\gamma$ rolls on a horizontal plane through $C$ and at the same time on a plane through $C'$ perpendicular to $OC$.

Produce the generating line $HQ$ to meet the principal planes of the confocal system in $V, P$; these will also be fixed points on the generator; and putting

$$(HV, HT, HP) = (A, B, C)$$

$$A = x + B + C + D + E$$

is a quadric surface with the squares of the semi-axes given by $HV, HT, HP, HP, HQ$ and with $HQ$ the normal line at $H$, and so touching the horizontal plane through $C$; and the direction cosines of the normal being

$$x'H, y'H, z'H$$

the line of curvature, called the polehode curve by Poinset, being the intersection of the quadric surface (44) with the ellipsoid (46).
